To facilitate reference from the Index to particular points contained in lengthy answers dealing with more than one subject, such answers have been sub-divided by means of marginal index letters—*e.g.* (*see* p. 40).

MINUTES OF EVIDENCE
TAKEN BEFORE THE
DEPARTMENTAL COMMITTEE
ON
AGRICULTURAL EDUCATION
IN
ENGLAND AND WALES
AT WINCHESTER HOUSE, ST. JAMES'S SQUARE, LONDON, S.W.

FIRST DAY.

Tuesday, 30th April, 1907.

PRESENT:

The Right Hon. Lord REAY, G.C.S.I., G.C.I.E. (*Chairman*).

The Lord BARNARD.

Lord MORETON.

Mr. F. D. ACLAND, M.P.

Mr. DAVID DAVIES, M.P.

Mr. NORMAN LAMONT, M.P.

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Professor T. H. MIDDLETON, M.A., M.Sc.

Professor WILLIAM SOMERVILLE, D.Sc.

Mr. H. S. STAVELEY-HILL, M.P.

Mr. A. E. BROOKE-HUNT (*Secretary*).

Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. T. B. WOOD, M.A., Reader in Agricultural Chemistry and Secretary of the Department of Agriculture of the University of Cambridge, called and examined.

1. (*Chairman*) Will you please inform this Committee in brief what has been the history of the Agricultural Department in the University of Cambridge?—The history of the University Department of Agriculture is briefly somewhat as follows:—In 1891-2 there was an idea of starting such a department in connection with the University, but at that time matters were not ripe for it. It was not then started officially, but in 1892 an informal Committee or Association was formed which included four of the University Professors, namely, the Professors of Chemistry, Geology, Botany, and Physiology, as well as representatives of ten neighbouring County Councils. That Committee was known as the "Cambridge and County Agricultural Education Scheme." It made quite an informal start, and was supported by a Government grant and by contributions from County Councils. Under that Committee the work showed signs of development, and later on—in 1898-9—endowments were offered by the Drapers' Company and by Sir Walter Gilbey, on the condition that the University took the matter up by creating a Department of Agriculture and appointing a Professor of Agriculture. In May, 1893, an Agricultural Examination Syndicate was appointed by

the University. The first examination for the Diploma in Agriculture was held in June, 1894, and examinations have been held annually since that date. The Committee I have spoken of and this syndicate together carried on the work of teaching and examining until 1899, when, as I have stated, it was taken over by the establishment of a Department of Agriculture in the University. The Professor of Agriculture was appointed in 1899. Since that time a degree has been given in agriculture, and the staff of the Department has been increased by the addition of a Reader in Agricultural Chemistry and a number of lecturers. That is, briefly, the history of the Agricultural Department of the University of Cambridge.

2. What courses of study are now provided?—These are a little difficult to classify, because an examination often serves two purposes:—We have first of all a course for the degree of B.A. in Agricultural Science. This is not an honours degree, but the ordinary B.A. In order to obtain it the student usually spends one year or a year-and-a-half or perhaps even two years in passing the usual University preliminary examinations known as the "previous" and the "general,"

covering a knowledge of classics, mathematics, &c. After that the student spends his third year in studying sciences applied to agriculture, and gets his degree on what is called the special examination in agricultural science. This examination also counts as the first part of the examination for the Diploma in Agriculture. In addition to this we have a course for the Diploma in Agriculture. Students for the Diploma, as a rule, do not start agriculture until they have done the first part of the science tripos, which is a general examination in various branches of science, or until they have done the special examination in agricultural science, which admits them to the final examination for the diploma. They have thus some general scientific training before starting on the diploma course. Candidates for the Diploma examination take a year's course of more advanced lectures and practical work in agriculture and the applied sciences, and get their diploma on the results of an examination which includes practical work in science, and a *viva voce* examination on a farm. Quite a considerable proportion of the students stay a year after their diploma and do research work. One may say, therefore, we have two courses—one more or less of an elementary character for the degree, and one more advanced and technical for the diploma.

3. Then the diploma constitutes a higher qualification than the degree?—Certainly, considerably higher.

4. Is it a rule that those who obtain the diploma obtain the degree first?—Not necessarily. In order to obtain a degree the student must reside three years in the University, and must pass certain other examinations besides the special examination. For the diploma there are no qualifications of that kind, either of residence, or any other examination except those for the diploma itself. For instance, we sometimes get very good men sent up as scholars by County Councils who may not have the requisite means to join the University. They come and take lodgings in the town, and go through the course of study and obtain the diploma, but cannot obtain the degree, although, perhaps, they may have done more work than is necessary for it, because they have not passed the preliminary examination, and have not joined the University.

5. Are they not considered to be students of the University?—The University recognises them in a way. When a County Council subscribes to the University fund for the Department of Agriculture it has the privilege of nominating students to come up in that way. That is a concession on the part of the University. These young men are allowed to come up provided they come from a county whose Council belongs to our Federation.

6. The students you refer to are sent up by County Councils?—Yes.

7. What is the total or the average number of students for the degree and diploma?—The total number of students in residence at the present time is 51. Entries are not due for the coming examination until the 14th May, and it is therefore a little difficult to state exactly what the numbers will be. My class for the diploma numbers 20, and I imagine that all these will enter for the examination. I have 16 in my class for the degree examination.

8. Is the number of students for the degree and the diploma increasing gradually?—Yes, I can give some figures to illustrate that. The entries in 1893 were nine, in 1894 they were four, in 1895 eight, in 1896 six, in 1897 nine, in 1898 four, and in 1899 five, so that there was an average of about seven in the years previous to 1899 when the University formally created a Department of Agriculture. Since then the numbers have been as follows:—34 in 1899-00, 27 in 1900-01, 19 in 1901-02, 32 in 1902-03, 20 in 1903-04, 36 in 1904-05, 37 in 1905-06, and 37 in 1906-07. This year we have altogether 51.

9. Is that both for the diploma and the degree?—There are about 20 for the diploma, and 16 for the degree. That makes 36, and the remainder are students who have not yet specified what they intend to do. They are attending lectures but have not definitely joined either class.

10. Do the County Council students who enter for the diploma come well prepared? I mean have they had sufficient preliminary scientific training?—The scholarships are generally given on our recommendation. A County Council receives an application from a boy for

an agricultural scholarship, and that boy is sent up to us. Our staff examines him and reports whether he seems sufficiently educated to benefit by the course of study. We do not recommend a scholar unless he seems qualified in that respect.

11. At what institutions have they received their preliminary training?—Anywhere. I have to-morrow to examine a boy who comes from Wellingborough School, sent up by the Norfolk County Council. Provided I report that his education is good enough to enable him to benefit by the instruction he will receive, he will be admitted.

12. Can you give the Committee an idea of the standard you adopt for admittance?—As to indispensable knowledge, a candidate must first of all be a good arithmetician, and fairly good at elementary mathematics. He should also have sufficient general education to enable him to understand lectures and take notes. What we always do is to tell them to write an account of something or other—perhaps of the kind of agriculture in their own district—and one can judge, from the kind of way they tackle that, whether they are the sort of pupils who will be able, in attending lectures, to understand the points and make intelligent notes. We also set them some general questions, and we expect them to be able to express themselves. The students at Cambridge are not taught as is done in a school, but have to go to lectures, and must therefore have some power of taking down intelligent notes.

13. Would you say that there was need for the development of general and technical agricultural education in the earlier career of these students?—That is a little difficult to answer, but I believe it would be a great advantage if they could have it. I find that if students come up with a fair knowledge of elementary mathematics and of English they can usually learn to follow with intelligence the ordinary lectures provided by the University for beginners.

14. Have they had any instruction in chemistry?—Some of them have, but others have not.

15. Do you think it would be an advantage if they had more of such knowledge, or do you rather think it an advantage that the University should begin at the beginning with regard to these sciences?—It would be an advantage in many cases if they had more knowledge of elementary science; but not necessarily of applied science. If they had, for instance, better knowledge of elementary chemistry and elementary botany, it would make it much easier for them to follow the lectures.

16. Are many of the students sons of farmers?—Yes.

17. And others are those who aspire to become land agents?—Yes, a certain number. Large numbers of the sons of landowners come to the University, and since the Department of Agriculture was founded, they have begun to attend instruction given by the department.

18. Do they form a majority?—Yes. These students form a majority of those classified in the list put in as farmers, agents and owners. Probably a considerable proportion are also counted in the column marked "Unclassified." The 19 described as "Unclassified" for the current year I have since found to be all connected with land.

19. Do those of the land-owning class afterwards manage their own estates?—I suppose that is what they have in view. One cannot always follow what they do afterwards, but no doubt that is their idea.

20. Is there any training of students who themselves intend to become instructors in agriculture?—Yes, and I think that is one of our most useful lines of work. We get an increasing number of young men who have more or less distinguished themselves in scientific examinations at the University, and are looking about for a career. After taking their degree they join Agricultural Classes and take their diploma. They then undergo a year's training in applied science, and frequently stay another year to do research work. They are then fitted for the higher class of teaching and research in agriculture. At the present time out of my twenty diploma students I have at least a dozen who have taken honours degrees in science.

21. In what direction do you consider that this work of the University requires further development? What is your most pressing need?—I think the lack of buildings is the most pressing need at the present

time. We have no buildings of our own. The Professor of Chemistry has kindly let us have a part of his basement, and that is all we have, except that other Professors occasionally lend us rooms for special subjects. At the present time we are practically confined to four small rooms in the basement of the University Chemical Laboratory.

22. Do you consider the number of the staff adequate?—No, I do not think it is. As our students multiply we want an increased staff.

23. In what direction do you think there should be an increase?—One or two of our staff have been with us a long time and have done good work, and we are financially unable to increase their salaries.

24. Then if you had more funds you would do two things. First you would add to the buildings, and then increase the staff?—One can scarcely speak of adding to the buildings as we have no buildings. We should like to provide buildings, and increase our staff.

25. From what sources is the income of the University with regard to this department derived?—Our income at the present time is just short of £3,000 a year. About a thousand pounds is derived from endowments, including the endowments I have mentioned from the Drapers' Company and Sir Walter Gilbey. Then there is £1,000 from Government grant, and nearly £800 (which, however, varies from year to year) from County Councils. That comprises practically the whole of our income. Not having our own buildings the fees go to the University, or, rather, to the department that houses us.

26. I suppose a separate account is kept for your department?—Yes, we have a separate fund called the Agricultural Education Fund, which is, however, supervised by the Financial Board of the University. We have to furnish an account every year to the Financial Board of the University.

27. What is the attitude of the agriculturists in the neighbourhood of Cambridge towards your work?—I should say at the present time the attitude of the agriculturists in the district with which we are connected is distinctly favourable to us. The best evidence of that is that two years ago we found that we were spending considerably more money on what one may call field experimental work about the counties than our County Council grants came to—that, practically, we were spending endowment money on local work in the counties—so we sent an appeal to the County Councils and pointed this out to them. They replied by giving us considerably increased grants, as the result of their coming over and inspecting our work at the University Farm. Very great interest is now taken in work of that kind. Perhaps another evidence is that last year about 600 farmers visited the University Farm during the course of the summer. That number, of course, does not include the many who visited our local experiment stations.

28. In what type of work does the farmer take the most interest? Is it in the practical side of the work, or in the scientific side?—I suppose the things that most appeal to the farmer are outdoor experiments, breeding experiments, and potato experiments, and the pasture experiments.

29. Is there a farm attached to the University?—Yes.

30. Does it belong to you?—No. It belongs to a local landowner, who was very interested in agricultural work, and gave it to the department for nine years, rent free. We still have a few years more of the nine years to run.

31. I suppose care is taken with regard to book-keeping in connection with that farm?—The students have samples of book-keeping given to them derived from the farm, but I think the farm accounts as a whole would not be instructive to them because the farm is an experimental one; for instance, last year we had a good many hundreds of plots, each of which had to be sown separately and weighed separately, and under those circumstances the labour bill becomes very heavy, and the accounts are hardly instructive as typical of practical farming.

32. But book-keeping is one of the things that is considered?—Certainly.

33. Do the small farmers as well as the big farmers take an interest in your work, and come to see the results?—We have farmers of all kinds who come to see us, but it is chiefly the larger farmers and landowners.

Of course, we interest other people besides farmers and landowners; we get many visits from seedsmen, for instance, to see the plant breeding experiments; and much interest is also shown by millers, brewers, and maltsters. The brewers have asked our botanist to write papers for their journal, and the millers have asked for us to go to their Conference and tell them about the wheat breeding experiments. These experiments seem to be creating great interest, not only with farmers and landowners, but with seedsmen and people who use the products, like millers and maltsters.

34. Can you give the Committee some general idea of the scheme of the field experiments?—First of all, there is the University Farm. There we carry on a certain number of demonstration experiments in the way of manuring and things of that kind, but we chiefly lay ourselves out there for the more permanent style of experiments, not demonstration experiments, but experiments with a view to finding out new facts in agriculture. At present we have research on breeding wheat with a view of making better varieties for distribution throughout the country, and similar experiments with barley and several other farm crops, notably with mangolds. Then we also have animal breeding experiments, and a very large number of potato experiments, especially interesting to farmers from the Fens and from Lincolnshire, and, of course, feeding experiments and so on. These experiments are all carried on at the farm.

35. I presume also experiments with artificial manures?—Yes; those also are carried out to a certain extent on the farm but they are done chiefly through the counties. In each of the ten counties which are associated with us, we have demonstration experiments carried on here and there throughout the counties. These are demonstrations with artificial manures, or farmyard manures or both. Then we also have variety experiments where we send out varieties tested on the University Farm. And we distribute seeds up and down to the farmers throughout the counties; and they grow them and their friends go to see them, and so on. Then, of course, we have a rather large scheme of pasture experiments—one in Northamptonshire which is subsidised by the Board of Agriculture.

36. Farmers apply to you to assist them in carrying out various experiments, do they not?—Yes, we get a large number of inquiries about various things, and if we get an inquiry that we think can be solved by experiment we assist the farmer in carrying it out.

37. You have no difficulty in obtaining the land for your experiments, have you?—We never have had up to the present. We have always been able to get more land than we have been able to find time to experiment on.

38. I suppose you consider that the plant breeding experiments are likely to be of great economic value?—Certainly; I think they will be of very great value indeed.

39. One of the objects is to give the English wheats the hardness of the Canadian wheats?—That, and the power of resisting disease, which our botanist has found to be a character that can be inherited.

40. Are there any experiments made in that way where farmers send you artificial manures to be tested?—No; we do practically no work of that kind; the only thing that we undertake is to do tests of the amount of fat in milk according to the Board of Agriculture scheme.

41. To whom do you leave that work?—To the County Analyst; we do not wish in any way to take on his work.

42. I need hardly ask you the question that you would like to see the grants allocated to your institution increased?—I should like to see that very much.

43. With regard to the method on which the grants are allocated, do you think a grant ought to be allocated for a specific purpose—for instance, the staff? Do you think there ought to be a division between the grants given by the Board of Agriculture and those given by the County Councils, that they should each have their own sphere of operations?—That has not been done up to the present at all. The only earmarked money that we have had is £200 a year of our Government grant which is given definitely for the farm; the Drapers' Company's Endowment which is,

Mr.
T. B. Wood.
—

Mr.
T. B. Wood.
30 Apl., 1907.

of course, ear-marked for the Professorship of Agriculture, and Sir Walter Gilbey's which was also given us for a definite purpose.

44. Then you do not think a change is necessary in that respect?—I do not think so; the present system works quite well in our case.

45. If farmers apply to you, do you send out lecturers?—In our agreements with the County Councils, we have a clause in which we volunteer to provide lecturers if the County Council ask for them, but up to the present we have never been asked for anything more than an odd lecture here and there. For instance, we go down once or twice a year to the Norfolk Chamber of Agriculture and give an account of the experimental work we have been doing in the last year, and the same kind of thing is done for the corresponding societies in Hertfordshire, there are two societies, one at St. Albans and one at Bishop's Stortford. Occasionally the same thing is done in Bedfordshire. In fact, in most of our counties we go down from time to time to meetings of farmers, and tell them the results of our work. We have not had any demand in recent years for what you might call continuous courses of lectures. I believe, however, that a certain amount of such work is done. We have a separate organisation at Cambridge for it, the Local Lectures and Examinations Syndicate; that is the Syndicate that runs the local examinations. They have a scheme for supplying lecturers on all subjects, and at one time, in 1893, 1894, and in 1895 they held quite a large number of lectures on agricultural subjects.

46. To what cause do you attribute the demand having ceased—was it because the lectures were not attractive enough?—Well, I personally gave a number of such lectures in 1892, and 1893, and 1894, and it was absolutely hopeless as far as I could see. I had three months of it in Devonshire, and gave what were supposed to be lectures on agriculture, but the audiences consisted of the parson in the front row, a few farmers in the second row, and labourers at the back, and I felt that if you talked to the front row you were ignoring the labourers, and if you talked to them you were boring the others. The task seemed to be hopeless, and, as far as I am aware, that is the general experience. Of course, where you can get farmers and those who are interested in the subject together, I believe you can do very good work, but to give a course of lectures in a village never seems to me to be likely to be successful.

47. You think the audiences ought to be classified as it were?—Yes; I think if you could get a farmers' audience, you would do very well.

48. If you got a farmers' audience, you think they would be interested?—Yes. At Cambridge they come to the lectures in the University Chemical Laboratory where we have the use of a big room, and give a more or less connected course from year to year. We get a large attendance, and I believe they benefit by it very considerably, but that is done through the Chamber of Agriculture, and those who attend are in the habit of going to meetings of the Chamber. They come there and ask questions, and they seem to like it and to profit by it.

49. Do you think that those lectures to succeed ought to be under the control of the Chamber of Agriculture and associations of farmers rather than syndicates under your own control?—I think that is one way of doing it; it seems to work pretty fairly well, but there might be other ways. I think the *sine qua non* is to get together a more or less homogeneous audience who all take an interest in what you are talking about.

50. Do you think the labourers ought to have separate meetings?—I do not think that you can do much good by lecturing to labourers.

51. You would limit it to farmers?—I think so.

52. (By Lord Barnard) I do not think we have yet heard exactly what your position is at Cambridge?—I hold a dual position in Cambridge. I am Sir Walter Gilbey's Reader in Agricultural Chemistry, and I also act as Secretary to the Department, and I believe I have also the title of Director of Studies.

53. How long have you been associated with this Department at Cambridge?—Since quite a few months after its foundation, early in 1893.

54. Might I ask you what you did before that. Were you engaged in agricultural teaching?—Yes. Before that I had been three months lecturing in Devonshire, as I mentioned a few moments ago. I also had done 2½ years as—I do not know that I had a title—but I was working for the Norfolk County Council, partly residing at a school, and teaching an agricultural class at that school, and partly managing the agricultural experiments in the County, and that kind of thing, and lecturing in the larger villages.

55. Were you brought up on a farm yourself?—Yes.

56. Have most of your staff, do you know, been associated from their early days with practical farming?—Yes. I should say most of our staff at the present time have.

57. Do many of your students—I think the question has been already asked—become teachers?—Yes.

58. Do you know of any who have become teachers?—I do. One of our men is Director of the Transvaal Department of Agriculture, several of them are in the Indian Department of Agriculture—I suppose that is what you mean by teaching for some of them are at Agricultural Colleges—two of them are in Egypt, three in the West Indies; and eight—I think there must be more, but I can count up eight—are on the staff of English Agricultural Colleges.

59. As you are in touch with the teaching profession, perhaps you could tell us whether there is such a demand for teachers as renders that profession a good opening?—Yes, I should say at the present time it is a very good opening indeed, and more especially so since there seems to be a demand for good men to go out each year to India.

60. Do you think one very useful part of the Department you are associated with is the training of men who are capable of acquiring further knowledge in agricultural science and of distributing it for the benefit of practical farmers generally all over the British dominions?—I myself regard that as, perhaps, the most valuable thing that we can do, because we get the honours men that you can turn into that kind of officer. One should start with a man who has had a good scientific training and who is looking round for a career, and that class of man we get in Cambridge in large numbers.

61. Can you tell me at all whether what you say of Cambridge, applies to other universities also—of course, only as a matter of opinion?—Not in such large numbers, because I do not know of any other place where you get such a large number of scientific students as we do. We have something like 130 or 140 men taking an honours degree in science every year, and that is comparatively a large number.

62. Would you tell the Committee what is the actual managing Board of this Department—under whose control is it?—The Department is controlled by a Board of Studies, just like every other Department in the University. Agriculture has its Board of Studies, consisting of the Vice-Chancellor and a certain number of *ex-officio* members, chiefly professors of Agriculture and cognate sciences, Chemistry, Botany, etc., a few members nominated by the Senate, and a member nominated by each County Council which contributes to the funds.

63. How many meetings do you hold of your Board?—Three regular meetings, and generally one or two extra meetings.

64. Do you find that the County Council representatives attend?—Some of them attend very well and some of them do not.

65. I think the Chairman has already asked you about the finance and you told us that the finances of the Department were kept separate and distinct.—Yes.

66. You have not a copy of the accounts, I suppose?—Yes, I have a complete set of the accounts from the commencement. (*Handing documents.*)

67. The University then, does not give any contribution towards the finance of the Department directly?—It does not directly.

68. You do not even indirectly get the use of these buildings; you have to pay for them, I understand, by giving up the fees?—Yes. I should not think the fees do more than pay for the chemicals and apparatus we use and the wages of the laboratory attendants,

69. I do not know whether you are personally concerned with the finance—I dare say you are?—Yes.

70. What is your opinion about charging fees. Do you think it is ever possible to get a larger contribution from students, say, towards the cost of this agricultural department?—I do not quite follow.

71. Could you make the fees or the contributions from the students larger than they are at present; could you get them to pay if you were to do so?—The great majority of our students, I think, would pay any fee you liked to charge them, and I think in the course of the next year or so we shall have to raise the fees, for the rent-free period of our farm soon comes to an end. I think we shall have to charge fees for the farm then, but we have charged no fee up to the present for farm classes.

72. As regards your County Council scholars, they would not be able to pay anything?—No, I do not suppose they would.

73. You would shut them out altogether then, probably, because their fathers would say “We cannot afford to pay these fees”?—I think under our bargain with the County Councils, we should never propose to raise their fees. The fees generally in all the university departments are under the supervision of the Financial Board of the University; you cannot charge just what fee you like. The amount of the fees at the present time comes to between £20 and £25 a year for each student, which is very small indeed, I think.

74. That does not appear in these accounts?—No, it does not come to us; it goes straight into the funds of the laboratory where we are housed.

75. Who supervises the examination of your students?—The Board of Studies.

76. Do you consider in view of the fact that you receive moneys both from local authorities and the central authority, that that works satisfactorily?—Yes, I think so. You see the University is a very experienced examining body, and although the Board of Agricultural Studies nominates, the University appoints the examiners. The Board of Studies draws up schedules and regulations, but they have to pass the Council of the Senate and then the Senate itself, so that they are very well supervised by an experienced examining body.

77. Is your department under any obligation to return any statistics or information as to the results of the examinations to the Board of Agriculture and the Councils?—No, I do not think so.

78. You do not test?—We have never been asked for any information as to the results of the examinations; the only thing we do in that way is we examine for one or two other institutions, and we report to their County Councils. We used at one time to take in students for a six weeks’ practical course, but there are two of our County Councils who have laid themselves out to make that the chief part of their work, so we gave up doing it. These County Councils ask us to examine and report from time to time on their students, and on the strength of our supervision, other County Councils send their short-course students to these institutions.

79. The County Councils do carry on institutions of their own as well as supporting others then?—Some of them do.

80. Bearing on the question the Chairman asked you as to the preparation of the students, do most of them succeed, or what proportion of them fail?—Shall I give them yearly for a number of years?

81. For about two or three years.—For last year the total number who presented themselves for the first or elementary part of the examination—that is the one for the degree and the first part of the diploma—was 29. Of those, 10 failed and 19 passed. That is for the elementary examination for the degree and the first part of the diploma. In Part Two, the final diploma examination, seven presented themselves; one failed and six passed. The year before, for the degree and the first part of the diploma, 17 presented themselves; eight passed and nine failed.

82. It looks rather as if the diploma students did better than the degree students?—Yes. The diploma students are all serious students.

83. (By Mr. Middleton.) They are weeded out in the first examination?—Yes. The man who goes in for the diploma is generally a hard working man, who means

to get through and take up agriculture as his real business in life.

84. (By Lord Barnard.) Do the diploma students all go through the degree examination first?—Yes, although they do not all necessarily get the degree.

85. You speak of an increased grant. That would not necessarily go towards the providing of buildings, would it?—We are raising subscription for buildings that we are getting on with. As regards building, I think anything in the way of an annual grant would practically only be used for maintenance.

86. The real object for which you wish an increased grant is one I can well understand, because I know of a similar case; it is that you think that the members of the staff are inadequately paid?—Some of the members of the staff are inadequately paid.

87. If this Committee should recommend an increased grant, on what grounds could they ask for it? At present, as we have heard, they could say that the teachers are not adequately paid, but are there any other grounds? Could you extend, for instance, the usefulness of the departments by increased funds?—Yes, certainly.

88. Might I put it in this form? In what way would the public get increased advantages if the public subscribed larger funds?—In this way: I think certain members of our staff who are all-important to our success may leave us if we cannot provide them with a better income. If we are to train these students who want advanced teaching, it seems to me that one cannot carry out advanced teaching and make these men keen workers, and give them the sort of spirit of research they want when they are going out to a new country and have to find out things, unless you have active research going on in the teaching institutions. It is very important for the turning out of first-class men of that kind that you should have active research going on, and you cannot get the type of teacher who distinguishes himself in the field of research unless you give him a proper income.

89. You have practically almost answered the next question I was going to put to you. You mentioned that your staff were very much interested in plant breeding and so on. That practically is research, is it not?—Yes.

90. Is that in your opinion almost essential?—Absolutely essential if you are going to turn out men of the kind that will be useful.

91. Would you agree with what the principal of a college, in which I am interested, in the North of England, put to me when I was discussing the question with him, that in the higher scientific education, research could hardly be separated from the other subjects?—I think it is absolutely necessary that you should have research as well if you are to get the right spirit in the men.

92. Do the farm accounts appear in this document that you have handed to me?—No; the only entry you see in these accounts is the £200 of the Government grant and some small payments that we think should be paid for out of the general funds.

93. Who runs the farm?—The Professor of Agriculture.

94. I suppose he makes it pay as far as he can?—I do not see how you can ever make a farm pay where you have to carry on experimental work.

95. Another subject touched upon by you was the question of analyses. I have noticed that a good many colleges seem to do a great deal of work under that head. I should have hardly thought that as provision was made for another public body, namely, the County Council, to do that work, that it was, properly speaking, educational work, and ought to be provided for out of those grants, unless you consider it necessary, as perhaps you do, as research work?—We do practically no work of that kind—what I might call ordinary routine analyses—If a farmer wants to find out something in the nature of an investigation, we are always ready to take part in that and do what we can, but we do not do any routine work.

96. The only other matter as to which I should like to ask you a question is as to what you said about the local lectures. I think you informed us that there was no demand for local lectures. Do you think that farmers as a class would come and attend lectures unless they

Mr.
T. B. Wood.
30 Apl., 1907.

Mr.
T. B. Wood.
30 Apl., 1907.

were offered to them and unless they knew that there was some opportunity of getting them if they asked for them?—I meant that the County Councils have not availed themselves of our agreement with them to give lectures if they asked for them. When our scheme was organized, we drew up a sort of agreement between ourselves and the County Councils, and one of the clauses in that was that we should send out lecturers if asked, but up to the present the County Councils have not asked us to do it except in isolated cases.

97. Are you aware that in the North of England, in the College with which I am connected, the system of lecturing has been very successful?—Yes, I believe it has.

98. In that case I think I am right in saying that the County Council do not ask for them as a rule, but that the College generally offers them. You do not know that, perhaps?—No, I did not quite know how it was worked, but I know it has been a success in the North.

99. I am referring to a series of lectures, not single lectures?—The local Councils did that in Cambridgeshire at one time, but it was no kind of success at all.

100. (By Lord Moreton.) Would you tell us what is the age of the students, generally, who go up for the diploma examination?—Just the age of the ordinary undergraduate, from 18 to 20 years.

101. As regards the farm, have the students any chance of doing practical work?—They do not do any manual labour, but they go all round the farm and see what is going on. They have to do their laboratory work and so on, and they do not get a great deal of time for instruction on the farm during the term, but our general advice to them is that during the vacation, from June to October, they should go either to a farm belonging to their relatives, or to some other farm, and take up practical work.

102. How many chances does a student have supposing he fails?—It is only the Honours examination that you cannot go in for more than once. For these preliminary examinations, you can go in as often as you like.

103. (By Mr. Lamon.) You have had rather an unfortunate experience with local lectures?—No, we have had no experience really.

104. I am referring to you personally. I was in Denmark last year, and one of the leading officers of the Board of Agriculture there, told me that during the preceding six months he had delivered 100 lectures in small villages in Denmark, and that his audience averaged about 150, and that the maximum was 600. With regard to your experience I should like to ask you why there is such great enthusiasm in that country, and whether you think it is due to the fact that most of the farmers there have been to secondary schools or to agricultural high schools, and whether secondary education of that kind would foster more interest in the scientific side in this country?—It seems to me that the number of the audience does not convey any certainty as to whether it is doing good or not. For instance, when I was lecturing in Devonshire—there were five of us giving lectures during that winter, and we had an average audience of 56—but you have already heard my opinion. I do not think it did any good at all, and I do not think that numbers really convey anything. I do not see how you can, in an English village, get an audience of the right kind, because, supposing in a village there will be four or five farmers who are near enough to come in, the remainder of the audience would probably be necessarily not very much interested, and I do not see how, in Denmark either, you would get a suitable audience of 100, unless they came a great distance. Possibly labourers might come in, but I do not see what good it would do the labourers if they did.

105. I should like to ask you a question on another point that you referred to. You said that you had several students who had gone out to the West Indies. It has come under my notice what excellent work they have done out there, and I should like to know whether you have any branch for instruction in tropical work, or whether those men have merely been through the ordinary course?—They have merely been through the ordinary course and seen how investigations are carried out; they have done no tropical agriculture or anything of that kind; they have merely seen the general sort of

way one goes about trying to investigate any particular problem that may turn up.

106. Do you think if there should be a larger demand as is very possible in the near future for men of that class, that under your present system you could keep pace with it?—I think so. I think that is the advantage of an Agricultural Department in connection with a large scientific centre because, as I said before, we have 130 or 140 men who have taken an honours degree in science, and most of them when they have their degree, look about to see in what direction they can best work; and I think as the openings for agricultural experts increase in number an increasing number of men will take up the subject.

107. That would also apply perhaps not to experts, but to estates managers of tropical estates, many of whom have not the slightest scientific knowledge. That is a department in which there would be a very large opening, is it not?—I do not think any of our men have taken up that line at present; it is a line I do not know about at all; I do not know how one finds out about the openings in that line.

108. (By Dr. Somerville.) Do the men that are taking the degree in agriculture, or the diploma, get any choice as regards the number of subjects?—No; they do not at the present time; they have to take certain definite subjects.

109. I suppose no provision is made at the University of Cambridge for encouraging students to apply their historical knowledge in the direction of agriculture?—Do you mean in the way of lectures? There is no provision in the examination for historical knowledge.

110. Do you think it would be a good thing to widen the basis of examination, to take, we will say, economics or history as alternatives to science?—They can take their degree in economics; there was a new economics degree founded last year—an economics tripos.

111. But not specially designed for agricultural students?—No.

112. In Cambridge you have a lectureship for agricultural economics, but I suppose attendance at those lectures is not of much advantage to a man going in for this course?—No; the lectures given by that lecturer are only about four in a year. There is, however, a provision in the statutes regulating the diploma examination; for putting in certain subjects and leaving out certain others.

113. Would the initiative in such a change come from the Board of Agricultural Studies?—Yes.

114. Do you find that the scholars the County Councils send up to the Agricultural Department of the University are to a large extent the sons of farmers?—Yes, I should say the majority of them are certainly the sons of farmers.

115. I think you have already told the Committee that there are few, if any, secondary schools in East Anglia, which might act as feeders for the University Agricultural Department?—I do not see why any secondary school should not train suitable boys for the Agricultural Department; we have one special school at Cambridge which lays itself out to do that.

116. Do you find that youths come on from this secondary school at Cambridge?—It has only been going quite a short time and it is only just now that the boys who have started there have got up into the top forms and are ready to come on, so that we have not had an opportunity of judging yet. The agricultural course there begins in the lower forms and it takes them four or five years to get up to the higher forms where specialisation begins.

117. Is not Bedford entering upon some such scheme also?—I am not aware of that.

118. Has not Bedford in point of fact, got something in the nature of a secondary school at Ridgmont?—Not a secondary school; but it is what you might call a place suitable for six weeks' courses for practical work, dairying and that sort of thing.

119. Have not they the intention of adding an agricultural side to the school in the county?—I do not know.

120. Would you not think it is conceivable that the bent of youths to engage in agriculture would be encouraged to a great extent if in the ordinary grammar school was introduced something in the nature of

an agricultural school, which would act as a sort of bridge between the grammar school and the Agricultural Department in the University?—I do not know that I have any very definite views on that subject. My view is rather that they should teach elementary science in a sound way than that they should try and teach them applied science. I much prefer that they should learn the elementary subjects thoroughly.

121. Would you be disposed to suggest that if the teaching of elementary science was carried far enough the youths who come up to Cambridge might be allowed to pass an examination on the strength of such knowledge gained before they came up?—I do not see why they should not do that. The more they know to start with, the more time they will be able to devote to advanced work after they come into residence.

122. As regards your financial future, I suppose that in a short time you will be called upon to pay rent for the experimental farm that you now occupy, or for some other farm that you may acquire?—Certainly, we shall.

123. What is that sum likely to amount to?—I believe if we continue with our present farm, the rent will be something over £200 a year.

124. Is it not also the case that the Gilbey Benefaction automatically runs itself out?—Yes, in about three more years it comes to an end.

125. What will that mean?—That will mean £200 a year decrease in our endowment.

126. That is a second £200 that you may possibly lose?—Yes.

127. I suppose the buildings you contemplate erecting will cost a considerable amount for maintenance? Is there any special fund for the maintenance of those buildings?—Most of the buildings are maintained out of the fees students pay.

128. Apart from the buildings, you see your way to finding yourself poorer in the near future by £400 a year than you have at present?—Yes; we have that to face.

129. Unless that £400 a year is made up in some other quarter, your operations will be considerably hampered?—Yes, unless we can make up part of the rent by charging fees for the working on the farm.

130. So that whilst you aspire to have your sphere of activity enlarged, you are threatened with curtailment?—Yes.

131. You would like not only to have this £400 a year supplied from some other source, but possibly you might like £400 a year in addition, which would mean a gross addition to your income of £800 a year?—Yes we certainly should.

132. Reverting for a moment to the University; Extension Lectures, you are aware, as you have admitted, that in some parts of the country, local lectures are a great success. In any case, do you think that men engaged as teachers and investigators of agriculture should have their time cut into by giving such lectures?—I think there should be special lecturers for the purpose.

133. If the funds were forthcoming, do you think that lectures could be better supplied by a department like yours than by a county staff which was cut off from the direct influence of the University?—I think in the Eastern Counties it would be an advantage that the lecturers should be connected with Cambridge University.

134. Do none of the Counties maintain a lecturing staff?—I think the staff of the Institute in Essex go about the county and give lectures to a certain extent, but I fancy they are not so much in the nature of courses as isolated lectures on definite experimental results.

135. How do you think the rank and file of young farmers is going to be reached if in fact there are no local lectures, and where they are confined to University centres?—I think a great many of them go to Chelmsford and Bedford: we examine a certain number every year for Norfolk and Suffolk with a view to awarding scholarships for that purpose.

136. But, still, you would admit that a very small number of the farmers find their way to those two places?—Very small.

137. Do you find the peculiar constitution of your Board of Studies is in any way unsatisfactory?

rather refer to the fact that your Board of Studies includes a considerable number of men who are not necessarily members of the University. You do not find that those men are in any way an incongruous element in the constitution?—No, we have always got on very well on the Board.

138. You do not find that there is any opposition on the part of the University to such members being on the University Board?—No, not at all.

139. You said that the fees paid by the students all go into the laboratory in which you are housed?—Yes, practically all.

140. Do the botanical fees go into the botanical laboratory?—Yes, except occasionally we have a sort of teaching class of botany for which we borrow a room in the chemical laboratory, and then we get those fees because no chemical apparatus is wanted for them.

141. Fees, I suppose, are exacted for botany, chemistry and geology?—There are no fees for the lectures on applied sciences unless they involve experimental illustration.

142. Fees would be charged, then, for agricultural chemistry?—Not for lectures, only for working in the laboratory.

143. I suppose the fees for the second part of the diploma course are lower than those for the earlier stage?—They certainly are; they come, I should say, to something over £20 for their first year for the elementary work, and rather under £20 for their second year.

144. What do you reckon it costs an agricultural student who is going to take his degree, and is a member of the University, to live for a year?—You cannot really lay down a rule, because it all depends on the man; the irreducible minimum would be something like £100 a year.

145. You find most of the students spend more, do you?—Yes, most of them.

146. Would £150 be a likely minimum?—Yes, that would be a comfortable allowance.

147. In the case of a man coming up and going into residence and not necessarily being a member of the University, what do you say?—It would be much less than that. We had one student who resided for two years and got his diploma, and his total income was the county council scholarship of £65 a year, out of which he had saved money at the end of the time.

148. That, of course, is only for about six months' residence in the year?—Yes.

149. So that you think the agricultural education in Cambridge would not prove much more expensive, if at all more expensive, than in some of the other education departments?—No, I do not think it is any more expensive at all.

150. (By Mr. Staveley-Hill.) I suppose students who come up for a diploma as distinct from a degree need not necessarily reside in the University or in the town of Cambridge either?—No, the diploma examination is an open examination.

151. They could reside at home and attend the University course without very much additional expense?—That is so. The examinations, however, differ from most other agricultural examinations in that they include practical work in the sciences and practical agriculture on the farm.

152. What is the acreage of the University farm?—Between 140 and 150 acres.

153. You have ten County Councils who contribute to the funds of your department?—Yes.

154. Are there other County Councils who do not contribute who send students up for the diploma?—There have been such cases, but it is only what I might call occasionally. For instance, I found one of our men, after he had been at Cambridge for a year or two, was a scholar of the Lancashire County Council who had distinguished himself in an open scholarship examination and had come to Cambridge. Of course they cannot send them up as members of the University.

155. Do you give any facilities for the training of teachers who instruct in rural schools?—Yes.

156. Do you find many of the teachers avail themselves of them?—I think we began in 1893, and there has been a course every year for teachers in elementary rural schools, except one year, when there was a smallpox scare or something of the sort and we

Mr.
T. B. Wood
30 Apl., 1907.

Mr. T. B. Wood. had to put them off. We have had as many as 120 in number, and as few as 40.

30 Apl., 1907.

157. Do lecturers go down to the different districts for the purpose or do the teachers come up and attend the classes?—Both. We have had a winter class at Norwich, and from time to time we have had a course in the winter at Bedford, too, and occasionally at other places, and then during the summer holidays they come to Cambridge and attend the class that we hold there in August every year.

158. In answer to the Chairman you mentioned the case of a boy who had come up from Wellingborough?—Yes.

159. Are there any teachers from that type of school who avail themselves of the facilities that you offer?—No—though it is not quite correct to say “no” because occasionally one or two come with the elementary ones, but we have not had any special course of instruction for them.

160. You have told us that a considerable number of persons visit the farm to see the various experiments that you are carrying out, or apply to you for information. Are the bulk of those persons more interested in what you might particularise as research experiment rather than the ordinary branches of experiment?—I do not quite follow.

161. You spoke of research just now as being one of your prominent features of experiment, and I ask you whether the persons who come to you for experiments are persons more interested in that particular branch of study rather than in the ordinary farming experiments?—I do not think you can tell that, because all the things go on side by side. They always evince the greatest interest in breeding experiments of all kinds; those are an unfailing source of interest, but, of course, the interest varies with the different districts. People coming from the Fens want to see potato experiments; those are the things that interest them. It just depends where they come from; people from one district like one kind of thing and people from another another.

162. (By Mr. Latham.) With regard to these young men who come to you. You said that you wished them to have a fair knowledge of farming?—You mean when I examine them to see whether I can recommend them for a scholarship?

163. Yes?—I do not think I said a fair knowledge of farming.

164. I think those were your exact words?—That is not what I meant, then. What I want them to have is a fair knowledge of elementary arithmetic and mathematics and a fair general education so that they can express themselves and understand things, and then, as I say, I find that out by asking them to describe what kind of farming goes on in their district; that is only an instance of the kind of question one asks them. It is not so much to ascertain their knowledge of farming as to see whether they are fairly intelligent and whether they can express themselves well.

165. I suppose the ordinary undergraduate does not know much about farming?—No; the ordinary undergraduate does not, of course, unless he happens to be of a farming breed; most of the County Council students, however, are farmers' sons.

166. Possibly that is so; but do you find that they know much about farming?—If they were the sons of farmers I should not recommend them for a scholarship unless they could write an intelligible account of what their fathers grew on their farms. I do not think we should recommend any of them as suitable for a scholarship unless they were intelligent and were likely to profit by it.

167. Do you find that many of them, after they have obtained their degree, do actually become farmers?—A good many of them do go back to farming, the majority of them I should say do. But among our County Council students we have had several who have had the good fortune to distinguish themselves very much; in fact, the man who is now Director of Agriculture in the Transvaal was at one time a student of the Huntingdonshire County Council, and two of the junior members of our staff at the present time were county council students. So that there are a certain number who turn out very smart indeed, and then they see that they can get a more immediate return, perhaps, by taking up teaching, or some branch of that kind, than they could by going back to farming, but otherwise the majority of them do go back to farming.

168. You said just now that students in the term had not much time for farming on your farm, and that you recommended them to go on to farm work in the recess?—Yes.

169. Is that without a teacher?—No, there is our farm manager there.

170. But you said on their own or other farms in their districts?—We recommend them to go on to our farm, of course; but sometimes they have fathers or relatives who have their own farms, and who want them to see the kind of farming that goes on in their own districts.

171. Do you get any record of what they have done in the recess?—No, we do not; but we find out what they have done when we come to examine them next.

172. With regard to land owners' sons and land agents' sons, do you find that they have any general knowledge of farming?—No, I should say they do not as a general rule.

173. I see you have given us a list of your various experiments, but you do not give us any results?—I have copies of the results here if you would like to see some of them.

174. Yes, I think they would be very useful.—This is our ordinary guide to the experiments, which we give to the people that come to visit us, as a sort of guide to show them the way round. (*Handing book.*) This is what you may call a farmers' bulletin, for explaining to the farmers any one experiment. (*Handing another book.*)

175. Do you take any interest in teaching draining?—No, I cannot say that I do, particularly; that does not come in my branch—my branch is chemistry.

176. Is it at all within the province of your department?—I believe it is in our schedule, and I have no doubt the Professor of Agriculture deals with it in his lectures; but it does not come in my branch.

177. I was rather disappointed to hear you say that these local county lectures were not a success?—Of course, I only gave you the result of my own experience; I say I could not make a success of them. I got an audience, you know; but I did not feel that I was getting at the kind of people that I was paid to get at.

178. You spoke just now of the parson being in the front, the farmers in the second row, and the labourers at the back. Perhaps the parson was the chairman of the meeting?—No, I only instance that as the kind of class you get at these meetings; they are such a mixed audience.

179. Yes, but they are all interested in agriculture?—I do not know. I found if I tried to interest the front row I was not getting at those in the second, and if I talked to the back row the other people in the front got absolutely bored.

180. I should have thought that the farmers and the labourers were so absolutely wrapped up in agriculture that what you taught one must have benefited the other?—Well, perhaps I did benefit them, but I did not feel that I did; I felt all the time that I was not fulfilling my vocation.

181. Still, you would scarcely like to throw cold water on these lectures, would you?—No, there are districts where I believe they do very well indeed, but in the districts that I have had experience of, I have not found that we really were doing any good by the lectures in villages. On the other hand, I believe we do a great deal of good by the lectures at meetings of farmers, and at the Farmers' Clubs, and at the Chambers of Agriculture, where we get a uniform audience that you can talk to, and where we find that a fair proportion of them understand and take an interest in understanding what you say.

182. Do you hold lectures in towns on farmers' market days?—Yes, we hold many lectures on market days in the Chambers of Agriculture.

183. Are they well attended?—Yes, always.

184. Do they ask questions, and take an interest generally?—Yes. You see that is the advantage of this method, they are all thoroughly interested in the subject, and they are used to debating and asking questions in their own Chambers of Agriculture.

185. Do you do anything in horticulture?—No, we do not; nothing at all.

186. That is not in your department?—No.

Mr.
T. B. Wood.
30 Apl., 1907.

187. Have you ever tried labourers' lectures?—No, we have not done anything in that line at all.

188. (*By Mr. Davies.*) I think you told the Committee that you considered it very important to have a department of agriculture at a University centre. What advantage do you derive from the fact that it is in close proximity to the other departments, such as the Chemical Department, for instance?—What advantage besides that?

189. Yes.—First of all I think the great advantage is that you have a large number of men taking their degree in science every year, and they come on to agriculture afterwards. We have, perhaps, 130 or 140 who take their degree in science yearly, and who do not know what they are going to do, and they wait and look round, and, as I say, many of them come on to agriculture. At the present time we have a number of them doing agriculture, with a view to fitting themselves for agricultural appointments. They have had a very good scientific training, taken an honours degree, and would be just the men suitable for an agricultural appointment. That is one advantage.

190. When you have the agricultural buildings will there be any need for an alteration in the chemistry department?—Yes. I do not think we should teach any of the elementary chemistry in our buildings. If a student wants to do agriculture and he has not done it already in the tripos then he will have to go to the ordinary existing instruction in chemistry at the University, and come to us afterwards.

191. I think several members of the Committee made a point that there were posts abroad for agricultural experts and people who had had scientific training in England. Would it be the intention of your department to specially cater for men of that kind?—Certainly.

192. What special advantages could you give that other centres could not give in that direction?—I think the preliminary advantage is that we first of all have the men who have taken their degree—we have 130 or 140 of them every year, which would not be the case with an isolated institution set down somewhere in the country away from a university; they would not get that advantage.

193. What special advantage do you give in Cambridge which those other Universities could not at present give?—I do not know that we could claim to give any other advantage that another university could not give, except that we are on a larger scale, and also the point that I have mentioned with regard to the number of men.

194. You have no short course now, I understand, in your department?—No, not at present. We agreed with the County Councils that we should give up that part of our work, and recommend all our counties to send their students to the already existing short-course institutions, and we undertook to examine those students.

195. Do the scholarships which the County Councils give follow on the results of those examinations?—Not exactly. They send their students, and we examine them at the end of the course, and our report is sent out to the County Councils so that they can see whether the institutions are being conducted as they wish them to be conducted.

196. I understand the scholarships are given after you personally have examined each student?—Yes; but it is not a competitive examination. They send the students up to us and ask us whether we think they are the kind of student who would benefit by a short course.

197. How do they choose them, do you know?—I do not know that; they simply come to us with a letter from the County Council. In some of the counties, Essex for instance, they give further scholarships on the result of our examination at the end of the short course. We have two Essex students at the present time who were awarded scholarships last year.

198. Supposing Cambridge was specialised and catered specially for the agricultural expert, and had opportunities of doing a good deal of research work, do you consider you would then attract men from other university colleges?—We do that now; we have several graduates of other Universities who are doing research.

199. (*By Mr. Medd.*) When you receive grants from the Board of Agriculture, do you furnish the Board with a statement of the exact manner in which the

grant is going to be applied?—We furnish the Board with this kind of account—

200. Do not trouble to show it to me. Must the Board be first of all informed exactly how you intend to apply the grants specifically? That will meet my question.—Only in a general way; we make an estimate for the whole of our income.

201. At the end of the year do you furnish the Board with a statement exactly how it has been applied?—Yes.

202. No portion of it goes towards defraying the expense of lectures attended by other than agricultural students?—No; certainly not.

203. In addition to the grounds which Professor Somerville mentioned for you to urge further claims he omitted the experimental and research work which I imagine you regard nationally as your most important work?—Yes, I think that it is indispensable.

204. From a national point of view rather than from a purely local one?—Yes, not only from the point of view of its economic importance, but because you want research so as to get the proper spirit in your advanced students.

205. Exactly, and money is urgently needed in order to enable you to develop that work as you consider it ought to be developed?—Yes, I think so.

206. What is the exact relationship of these ten affiliated counties to your Board of Studies—they each have a representative?—They each have a representative.

207. Does your Board merely act as an Advisory Committee saying how funds should be dealt with by you if you give any, or how lectures should be supplied by you, and so forth? What are its functions?—The functions of our Board are to manage the teaching and examining of agricultural students in the University, and it has the power also of appointing examiners for any other institution—I mean generally acting as a public examining body if it likes. It also manages its own funds.

208. It has very little direct relationship then to the agricultural education of the individual counties?—As a Board I should say very little.

209. It never attempts to suggest any scheme by which the most appropriate types of school and forms of instruction might be introduced into these different counties?—No, it does not.

210. Each county in that respect works independently?—Yes. The only way in which it has assisted in that is that members of our staff have been co-opted on to the County Council Education Committees.

211. I understand each of the local bodies makes a contribution to you, and I think that contribution has increased by 50 per cent.?—Yes, it was increased by 50 per cent. three years ago.

212. As a matter of fact, in this area of 10 affiliated counties you have no permanent institution whatever for intermediate agricultural education except the technical day school at Bigods in Essex. There is a complete blank between the elementary school and the University—I mean there is no *bona fide* intermediate school of agriculture taking students from the age of 13 or 14 up to the age of 16 or 17?—That is so.

213. The only form in which that education is given is by occasional short courses and lectures and continuation classes—I am leaving out the work at Chelmsford, of course. Perhaps you may not know what the individual courses are?—No, I cannot say what they do in the other counties.

214. Coming to Cambridge itself, you have a most elaborate system of continuation schools. Do you know anything about the horticultural or agricultural work that is done in them?—No, I cannot say that I know very much about what is done outside in the counties; I used to, but I do not know now.

215. Do any of your university students enter for the National Diploma in Agriculture?—No—why should they?

216. You consider yours equal to, or superior to that?—Yes, we have the same subjects with the addition of practical ones. We set great store on the fact that our people have practical training in the laboratory, and all that sort of thing, and that they do not learn their work just from books.

Mr.
T. B. Wood.
30 Apl., 1907.

217. Part of your *viva voce* examination is conducted on the farm?—Yes. Of course, another reason is that the National Diploma comes in the middle of our May term, which already has only a month for work before our own examination. If our men were to take a week out of that, it would make our work impossible.

218. The National Diploma, as at present constituted, is not useful for your purposes?—I should say not.

219. Can you suggest any mode by which the standard of examination might be raised, or its character modified in such a way as to attract your students?—I take no interest in the National Diploma at all. I think the University is the best examining body, and I do not see what you want any other for.

220. In regard to the county scholarship students, the majority of them are from the land in the sense of being sons of farmers, are they not?—The majority of them are.

221. Do the majority of them go back to the land to farm afterwards?—I should say so; from those that one can follow, I should say they do go back to the land.

222. Could you give any idea as to the relative proportion of those who become teachers and those who become farmers of the county scholars?—I think very few become teachers. There is one in the Transvaal now, and two on our staff at the present time.

223. You think the majority go back to actual farming?—Yes. One of them did have a teaching post in Ireland for a time, but now he has given that up and is farming.

224. Do the scholarships cover the fees only, or are they sufficiently large to cover maintenance?—That all depends on whether the student joins the University or whether he does not. If he joins the University, the largest county scholarship, I think, is £65 a year, and it would cost him certainly £100 as the minimum. If on the other hand, he does not join the University, but simply takes lodgings and lives privately, then I think he could live on his £65 and pay his fees, in fact, as I mentioned, one man actually saved money out of his £65.

225. Do you think £100 is the lowest minimum for those who join the University?—Yes, as I said before, I consider that is an irreducible minimum.

226. You mentioned the County School at Cambridge. Of course it has not had any opportunity yet of giving any definite tests, but still, so far as you know, you believe it to be good?—Yes, undoubtedly.

227. How do the farmers regard it?—They send their boys there in large numbers.

228. They seem well disposed towards it?—Yes, I think so, certainly.

229. They are not misled by the use of the word "agriculture" into the belief that farming is taught?—No, I do not think so.

230. You say you have provided short courses for teachers in the summer. Have you ever thought of providing courses for elementary teachers continuously throughout the year so as to enable them to study whatever they may be teaching at all seasons of the year?—That is done to a considerable extent; it is done at Norwich, for instance.

231. Yes, I know it is. Could you do it at Cambridge?—It has been done at the County School, but not by us.

232. It was done last year at the County School was it?—Not last year, I think, but I believe the year before or two years before it was done.

233. Do you ever come into contact with the local correspondents of the Board of Agriculture?—Not officially, but I know a good many of them privately.

234. I was referring to your agricultural work. These correspondents do not come into communication officially with you at all?—No.

235. They are not a conduit pipe between you and the Board?—No.

236. You do not utilise them to represent your views in any way?—No.

237. Have you given any thought as to whether a permanent Consultative Committee of the Board would be more useful than these correspondents—a Committee that would meet periodically to discuss these matters; whether that would not be more effective than a system of isolated correspondents. The consultative committee would be on the analogy of Dublin or Paris or the Hague, a permanent body of men interested in agriculture, and with a knowledge of it, who would meet periodically to discuss matters in their own districts and formulate policies and so forth whereas, of course, isolated correspondents never do meet. Have you given that matter any consideration?—No; I do not think that I quite understand. It is not in my line at all.

238. You yourself have not found the local correspondents of any use to you in your work?—No, I have not come across them except privately.

Mr. B. B. SAPWELL called and examined.

Mr. B. B.
Sapwell.

239. (By the Chairman.) You are a member of the Norfolk Chamber of Agriculture?—Yes.

240. You have no official connection with the University of Cambridge?—No.

241. You are prepared to inform the Committee of what you think as a practical farmer are the changes that ought to be made in the curriculum of the Agricultural Department, and you will give the Committee your impression as to the greater usefulness to which this department of the university in your opinion can be put?—I am not prepared to suggest any changes, my lord, but I am prepared to say what I think of it. I am a member of the County Council, of the Higher Education Committee, and I am Chairman of the Cattle Diseases Committee, and one of the Board's honorary correspondents. I have had to do with conducting experiments for many years, and I superintended the experiments in Norfolk long before they were thought of at Cambridge. I have taken great interest in the work they are doing at Cambridge, and I visit there every year unless for some reason I am unable to get away. We think most highly of the work they are doing, especially at their experimental farm. So much do we think of it that at present we are considering the advisability of establishing an experimental farm in Norfolk, which we should put entirely under the supervision of the Professor at Cambridge. We should ask him to recommend a manager of it, and we should ask him to arrange for the work to be done with the idea

of supplementing the work they are themselves doing at Cambridge. I think a couple of years ago we voluntarily doubled our contribution that we give them, because we thought so highly of the work they were doing; and we send agricultural scholars up there from Norfolk: they are not really scholarships but you might call them bursaries, because there is no competitive examination. If a farmer's son or any youth interested in agriculture appears a likely person we send him to Mr. Wood, and, if he thinks him suitable, we give him this bursary, which amounts to £65 a year; but we make this bargain with him, that he must spend the recess on a farm doing practical work, either with his relatives or with anybody he chooses. We have been very pleased with the results of those few men, but I am sorry to say they are few that we have sent up. The experimental work is very valuable as far as it goes, but there is not enough of it. The cross-breeding of animals might be enlarged to an enormous extent, and the same with the cross-breeding of cereals and all that. That is most valuable as farming goes, and with more funds that branch of the work might be greatly increased. All over the world, as you probably know, these cross-breeding experiments have been followed with a great amount of interest. Every year Mr. Wood comes down to Norwich and lectures to us upon his experimental work, and also to Lynn sometimes; and we find the people who go there are most interested, and, in fact, it is quite a red-letter day in the year when he comes down; they have those meetings reported

241 c

241 d

Mr. B. B.
Sapwell.
30 Apr., 1907.

in large print, and a great number of agriculturists attend them, and they always hear something new. For instance, a few years ago, the scientific cultivation of land was considered an inferior sort of thing; but, if you reckon up the money value that a little knowledge of that sort has meant to us in Norfolk, and in other counties the same, spread over thousands and thousands of acres, it is very considerable, and is entirely out of all proportion to the time that is spent in acquiring the knowledge.

242. The Diploma which is given at Cambridge is recognised by the farmers as a very valuable asset, is it not?—Most valuable. As Mr. Wood just said—I heard his evidence—the difference between that and the National Diploma is that we consider there is such a large amount of practical work attached to the Cambridge Diploma that makes it, in our opinion, more valuable.

243. I do not know whether you could give us any information as to why you attribute the lectures at Cambridge not having been a success?—I do not say they are not a success. I know Mr. Wood used to lecture years ago before he took this work up when engaged by the County, and I am inclined to think that the lectures that he gave there were most interesting and most valuable, and although a great many people attended as they would attend Church, as a sort of religious duty, I know a great many other people who being practically interested in the subject found them most interesting.

244. Do you think the lectures ought to be limited to farmers; that there should be a different set of lectures for farmers and a different set of lectures for labourers?—I do not believe you will ever get labourers to go to lectures. It would not be worth while sending a high-class man down to lecture to them; they really do not know enough; they are not educated enough to get any benefit from a high-class lecture. An elementary lecture might be useful to them, but I think it would be a waste of money to send a first-rate man down to lecture to labourers.

245. Is it your view that more should be done with regard to secondary agricultural education. Do you think there ought to be specific secondary agricultural schools?—No, I do not think so at all, not secondary agricultural schools; but elementary work leading up to a course of secondary schools, yes. You would not get people to go to an agricultural school where nothing but agriculture is taught. I think it is better for a boy to have a general education up to a certain time, and then to specialise afterwards. If he has a taste for botany and chemistry that might be cultivated, and when he is 17 or 18 hand him over to the Cambridge authorities and let them specialise with him.

246. You are quite satisfied that secondary education should be left to the Board of Education to deal with on general lines and that the Board of Agriculture should not entertain the establishment of any secondary agricultural schools?—That is my opinion.

247. I understand that you are now proposing to have an experimental farm in Norfolk?—We are only proposing it. We have done nothing at present.

248. But you personally wish to have a farm of a similar nature to the farm which the University of Cambridge at present has, and where the same, or perhaps a different series of experiments would be carried out?—Certainly.

249. That would become then a County experimental station?—Yes, under the direction of the Professor of Agriculture of Cambridge, who would probably duplicate the experiments that had been carried out at Cambridge or extend them.

250. And vary them according to the investigations you were seeking?—Yes. Of course certain experiments might go on for years. The seasons have to be taken into account and it might take a long time to arrive at a definite result.

251. In your opinion a farm of the kind would be useful?—It would.

252. (By Lord Barnard.) You are engaged in actual farming yourself now?—Yes.

253. And I daresay have been for a long time?—Yes, for 34 years.

254. You have told the Committee that you have a

high opinion of the research work which has been done at Cambridge?—The highest opinion of it.

255. You have also told us that you consider there is great advantage and benefit from that kind of work?—Yes, and especially with regard to these new wheats; we shall, I am sure, derive great benefit from them—and barleys also.

256. So that the work has been of the greatest possible benefit to farmers, even although they never attend a lecture or go to a class at all?—Yes, it is of great national benefit I am sure.

257. I am not familiar with the Eastern counties. What is the system of general education of farmers' sons? Do they generally commence by going to elementary schools?—No, not farmers' sons. The ordinary farmer's son goes to a grammar school, the fees of which range from £40 to £80 a year. I am Governor of the Grammar School of North Walsham, where you get a good general education for £40 a year, including board and lodging.

258. With regard to classes for labourers, would it be your opinion, even if the Board of Agriculture thought it advisable to provide instruction for agricultural labourers, that it should be entirely distinct from the higher scientific instruction?—Yes. You see, as a rule, a labourer leaves school probably when he is 13, and then goes to work, and he does not usually go to night school afterwards. Some do, but most do not, and he usually can only read and write with difficulty. It would be like sending a sledge-hammer to crack a nut to send a man like Mr. Wood to lecture to a class of that sort. The average schoolmaster who has learnt a little science could teach them some elementary chemistry which would be useful to them. I think you would find the best way to get at them would be to offer them prizes for stacking and thatching and ploughing, and that sort of thing. I think they would like that better.

259. To go back again to the matter of research work, I suppose your opinion is that of a great many other experienced farmers in your district?—I think I might say so. You should have seen the party that went up from Norfolk last year, about 60 or 70, and the interest they took in the breeding of animals and the cereal experiments—it is talked about now. I write a column every week for our weekly newspaper, and it was most valuable at the time for me, and, in fact, it has often provided me with material since. Farmers take great interest in it, and they write to me asking "Can you tell me what to do with so and so?" "Is such a manure valuable for this crop?" I get two or three letters a week of that kind, simply because they know I keep myself in touch with Cambridge. They come to me, perhaps, where they would not care to go to Mr. Wood, thinking that their questions might not be very wise ones sometimes.

260. (By Mr. Staveley Hill.) You were speaking of the practical teaching in schools. In Norfolk are there agricultural gardens attached to many of the schools?—Not to many, but to several.

261. Do the teachers at those schools give instruction to the pupils in agriculture?—Yes, but it is not general. For myself, I should like to see a garden and a menagerie attached to every school.

262. That might involve a large increase of grant?—Yes. We have a map like that one on the wall there hanging up in our Education Committee room at Norwich, and we hope to fill our divisions up with schools. We are proposing to endeavour to subsidise the schools, so that we hope to cover the county of Norfolk with schools where boys can be educated as day boys for six guineas a year, and as boarders from 30 to 40 guineas, and we are getting on pretty well with that scheme. Those will be the boys who will go to Cambridge, and you will find a great many more going up when these schools get well established.

263. Do you give, or encourage the giving of lectures on Saturdays throughout the year?—We have done it in the past but not recently—they have been merely lectures to schoolmasters. We have discussions in our Chamber of Agriculture, and if there is anything particular affecting the farmers at the moment we have no trouble in getting the best men to come down and read a paper to us on the subject, and then we have a discussion about it afterwards.

264. Do you not have some classes at Norwich which

Mr. B. B.
Sapwell.

30 Apl., 1907.

are conducted by the Cambridge University?—On agriculture?

265. Yes?—No, not now. We have had for teachers, but that has been given up at the present time.

266. (By Dr. Somerville.) You have not told the Committee how you would provide for the rank and file of farmers' sons as regards their technical education. You hope that a large proportion of them will go to Cambridge, but I suppose even that comparatively large proportion would leave unaffected by far the larger number of the young farmers?—If I said a large proportion it was a slip of the tongue; if we got two or three from every school it would be a good result.

267. Do you suggest that the technical education of the rest of the young farmers should be left unprovided for?—Of course, the farmer's son, as a rule, leaves school when he is 15 or 16, and up to that time my opinion is he should have just the same education as any other boy, except that if he had a taste for it, and his father wanted him to he might give some of his time to botany and chemistry, but we should not begin to label him as an agricultural student until he had left school.

268. When these young men leave school you would like to see a considerable number of them go to the department of Cambridge?—I should.

269. But that might not mean more than five to ten per cent. of the whole of the youthful population of the county?—I should like to see as large a proportion as that, but I do not expect to do so.

270. But that would mean that about 90 per cent. of the remainder would be left unaffected?—They would go on as they do now by looking round and seeing what others in a district who are better informed do. If you have one man who has had a thorough course and he settles down in a district, he does a great amount of good to the other men around him who never have been to Cambridge and who, perhaps, would not have been clever enough to derive benefit from it if they had gone there, and who do derive great benefit from seeing the actual work that this man himself is doing.

271. I quite agree with you. You do not think it would be at all desirable to add something in the nature of an agricultural side in grammar schools that boys might resort to during their last year or so?—No; they are not old enough.

272. I suppose you would agree that in many cases financial circumstances would be an impossible barrier to a farmer sending all or the larger number of his sons to Cambridge, and yet he might be glad to send them to some institution which was more accessible and where education might be obtained at a lower rate?—Yes; but he can go to Cambridge for nothing at the present moment. We are prepared to pay £50 a year to anybody that has got sufficient intelligence to derive benefit from it. He has to be there for twenty-four weeks, and we know that for that sum he can live at Cambridge for twenty-four weeks, and the only bargain is that he shall stop at a farm and do practical work for the other twenty-eight weeks in the year. I do not know what better we could do than that.

273. I did not know that you could offer that to anyone?—Of course we can, until the demand is so great that the funds will not permit of it; but at present we offer to any farmer's son two years, extended to three if he is reported upon by the professor as being worthy of it.

274. I suppose it means really that you have not more than three or four of these students?—That is so. Of course if they came in numbers we should have to have competition, and give it to the best man as a scholarship.

275. Can you give the Committee any idea of the cost of running this county demonstration station that you have in mind?—No; I cannot tell you the cost, but what I have got in my own mind is this, that I do not see why we should not run it for between £500 and £1,000 a year. That is what I have got in my own mind, but this is quite in *nubibus* at present; it has only been discussed during the last two or three months.

276. I do not want to tie you down to anything, but do you think to run this county demonstration farm at a cost of £500 to £1,000 a year would be a good use to which to put county funds?—I should like to see one run in every county in England. It would be admirable from every point of view.

277. You think it would be advisable for farmers to

see demonstrations in their own districts and on soil with which they were acquainted, and that the results obtained there would receive more attention than those, for instance, at Cambridge?—Not quite that; they would look to Cambridge as being the centre of their special knowledge, and to this as a sort of feeder to Cambridge, where results would be duplicated and extended. A question, for instance, might be submitted to the professor at Cambridge, and he might say, "We will give it to the farm to answer," and we would deal with it at the farm and work it out.

278. Have you been to the experimental station in the adjoining county of Suffolk?—No.

279. (By Mr. Acland.) In your desire to have a supplemental experimental station, are you influenced by the idea that farmers are more likely to go to their own places if they have them in the county or by the idea that these stations should be multiplied?—I have had an experience myself of over 30 years, and I think the station would be of the utmost benefit. A landowner recently said to me that he would like to see in Norfolk an agricultural bureau, with somebody there who was capable of answering questions on any practical subject, and I put it to him that you could not get a man whose opinion would be valuable to take charge of it, because, first of all, a man whose opinion would be valuable would be so very expensive; and again, that a good man like that does not always consider money only, and would not care to lead a semi-idle life; but if you have a station like this no one man need come forward, because you have half-a-dozen experts at Cambridge, to whom the farm manager could forward questions, and you would practically get an answer on any subject. That is how it arose; and the idea of an agricultural bureau was put on one side, and the experimental farm was suggested in the place of it.

280. You regard it as important in your own county?—Yes. I do not think you would get the Norfolk people to find the money for it except in their own county.

281. You experience difficulty in getting farmers to go outside their own county, even as far as Cambridge, to see what is being done, do you not?—I think so.

282. You think it would be more extensively used if you had a station in your own county?—Yes.

283. Do you think a system of short courses where you paid the railway fares of the students to attend them would be beneficial?—I doubt whether you would get the right people to go to them. Some would say they were engaged in practical work and others would say it was too far.

284. You doubt whether the short course idea would attract?—I think the money would be much better spent on an experimental station.

285. (By Mr. Davies.) I think you said scholarships were granted not as the result of any examination at all?—Not of any competitive examination; but we do examine them, as I say, to see if they are sufficiently intelligent to derive benefit from the course.

286. Anyone who wishes to go has to apply to the Education Committee, I suppose?—Yes.

287. I think you also said that the farmers in your county realise the great benefits which their sons would derive at Cambridge if they went up and went through the course. Is that so?—Yes, but I am afraid we do not get as many students as we would like.

288. So that in that sense it is not as popular as it might be?—Some farmers have not too much money, and our main object is to help the sons of those farmers who have not very much money. Of course it has been said that Cambridge is a place where young men might get grand ideas and that sort of thing, and we want to expel that belief. As a matter of fact, we have no fault to find with the treatment the men get there—snubbing or anything of that sort. I believe they say they are perfectly satisfied with the treatment they get.

289. You think the farmers who could afford to send their sons to Cambridge would prefer to do so?—I do; but farming is so bad that many men who can afford to send their sons to Cambridge prefer to send them into the professions, and those are mostly men who would make admirable farmers, but who make indifferent professional men. The farmers, however, say that they can put their sons into a profession for

£1,000, whereas if they want to put them into agriculture it costs them £3,000 and, therefore, they prefer the professions.

290. If you knew a man could afford to pay you would not send his son up to Cambridge?—No; it is only those people who we know, or think, cannot afford the £65.

291. I think you said that farmers appreciated very much the results of the experiments made at Cambridge?—They do.

292. Do you diffuse the results of the experiments amongst them?—I forget how many members there are of the Chamber of Agriculture, but there are probably 500 or more and every one of them has one of these books of Mr. Wood's which gives an account of all the work which is being done, and they discuss them in the Chamber and in the local papers, and I think the results of the Cambridge experiments are really known to all the farmers.

293. How do you get at farmers who do not take an interest in agricultural education, and who do not join your Chamber of Agriculture?—The Chambers of Agriculture have discussions about the experiments, and the local papers have articles on them; and you may depend upon it that the majority of the Norfolk farmers know about all that is being done.

294. (*By Mr. Medd.*) Do I understand your Committee consult the Board of Agriculture at all when formulating the scheme of instruction each year for the county?—No.

295. Would your Committee have any objection to submitting a scheme annually to the Board of Agriculture for advice and suggestions?—I think, if they get more money for the purpose they would; but I do not see how they can do it otherwise.

296. The Board of Agriculture is in possession of a great deal of useful knowledge, and have experience of many subjects, and I suppose your Committee would not object to receiving advice and suggestions from the Board?—I see what you mean. I am sure they would not; and I think the only reason they have not applied to the Board is because they did not know the Board would give advice. They have always gone to the Professors at Cambridge for the results of experiments, and, after consulting them, we have acted upon their advice; but, if the Board of Agriculture have more knowledge on any subject than the people at Cambridge, we should have no objection to consulting them.

297. (*By Mr. Latham.*) You have led us to suppose that it is about 3 per cent. that you get to go to Cambridge?—I should not like to bind myself. I do not think I said 3 per cent. I think somebody suggested 5 per cent. or 10 per cent. I could not give the percentage.

298. Can you tell me what proportion of your farmers' sons go to Cambridge, without going up through the County Council?—I could not say; I have no means of getting any knowledge with regard to that.

299. I suppose it is very, very small?—No, I think there are several. I know several young farmers in my neighbourhood who have been to Cambridge.

300. Do you consider in your county that the farming is done much better by those men who go to Cambridge than by practical men?—You see they do not go up to Cambridge merely for farming; they may be going for the professions. For instance, I sent my two sons to Cambridge, but not for farming; one is a barrister, and another is a doctor. I mention that because that is a case within my knowledge of a farmer sending his sons to Cambridge without any reference to agriculture at all.

301. That was the next question I was going to ask you?—I do not think there is a living at present in agriculture, and therefore I put my sons to what I thought they were better suited for.

302. Do you not think that applies in the case of other sensible men also, that they do not put their sons into agriculture?—Quite so; but I was referring to a different thing from a farmer sending his son to Cambridge from the farming point of view. A man may have a certain amount of means and he likes to send his son to a university, and he does so. Another man, however, may not have the means, and his son may be an intelligent lad, and he wants to send him up, and he can avail himself of our offer if he chooses. Of

course, I should not in my position dream of availing myself of the advantage that we offer, but there are other men who would be forced into accepting it.

303. What other men besides farmers' sons do you know of who have availed themselves of your offer?—There is one man, a gardener's son—I forget his name—a young man who is interested in agriculture, who went as a clerk in a manure works. He did not like that work and left it, and finding he had ability we gave him a scholarship, and he is turning out marvellously well. There was another one—I forget his name also—that we sent up who is doing exceedingly well; and the Cambridge authorities are very pleased indeed with them.

304. Will they go back to the land when they have finished their course?—I suppose those men in particular will go in more for agricultural teaching. One of those men now is a fellow of the Institute of Chemistry.

305. Can you give us any idea of the number of men who have gone through these degrees and diplomas, and have gone back to actual farming?—There is a Mr. Sherringham, who got his £65 scholarship. Sir Horace Plunkett got him a lectureship in Ireland, but the country did not suit his wife, and he had to leave there, and he went back to farming and settled in our district. He is a first-rate farmer, and he is the centre of agricultural learning all round, and will be for years to come. People watch what he is doing; they know he has been to Cambridge; and he will do good to perhaps 50 or 100 men who have not been to Cambridge, and would not think of going there.

306. You think the Cambridge man makes money faster than the practical man?—The best scientific man is no good as a farmer without practical knowledge, we all know that very well; but a practical man with science is better than a practical man without. We insist in our scholarship on 28 weeks of practical work, and I think we are turning out some useful men.

307. I was rather sorry to hear your remark about the labourers. I do not pretend that you can expect to educate the older men now; but could you not educate the younger men?—How many in a neighbourhood would there be; and again, as I said before, if they are good enough we would give them a scholarship.

308. They would not be good enough for that, I am afraid?—Well, what could you teach them? They get the practical work on the farm, and it would not be the slightest use sending a man like Mr. Wood from Cambridge down to give them a lecture; but we give them night schools, and we teach science in the night schools, and in the winter if they like to avail themselves of it; that is very valuable work for the labourers.

309. Would not a great many of the labourers and farm bailiffs and that kind of man be improved by a little scientific work?—We are prepared to give them that in the night schools. In the winter they can go to evening classes, and have one of the schoolmasters who has been taught science at Cambridge, and he would be able to teach them that.

310. Do you find the night schools are taken much advantage of?—No; I cannot say that I do.

311. Then the difficulty is that they are not taught?—No; but would you have a first-rate lecturer come down to give them a lecture that they would not understand?

312. No; but in my experience this better-class young man will go to lectures?—You see the place is not populated enough for lectures.

313. (*By Lord Barnard.*) Am I quite correct in understanding that your desire for an experimental farm is not exclusively that you may have a county farm, but that you may have a farm in connection with the work that is carried on at Cambridge, and the extension of that work in consequence of the insufficiency of the existing centre?—That is exactly what we feel. The work at Cambridge is so valuable that we want to extend it, and that is how we think it could best be done.

314. With regard to these bursaries that you give, am I to understand the object that you have in view is to enable a man, whether he is engaged in farming or not, who is desirous of, and who is capable of taking up agriculture, and who could not otherwise afford it, to get the advantage of that special education at Cambridge?—That is so.

Mr. B. B. Sapwell.

30 Apl., 1907.

SECOND DAY.

Wednesday, 1st May, 1907.

PRESENT :

The Right Hon. Lord REAY, G.C.S.I., G.C.I.E. (*Chairman*).

The Lord BARNARD.

The Lord BELPER.

Lord MORETON.

Mr. F. D. ACLAND, M.P.

Mr. DAVID DAVIES, M.P.

Mr. NORMAN LAMONT, M.P.

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Professor T. H. MIDDLETON, M.A., M.Sc.

Professor WILLIAM SOMERVILLE, D.Sc.

Mr. H. S. STAVELEY-HILL, M.P.

Mr. A. E. BROOKE-HUNT (*Secretary*).

Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. THOMAS CARRICK called and examined.

Mr.
T. Carrick
1 May, 1907.

315. (*By the Chairman.*) You are an Alderman of the Northumberland County Council?—I am.

316. And a Member of the Council and Agricultural Committee of the Armstrong College, at Newcastle-upon-Tyne, which is connected with the University of Durham?—That is so.

317. When was your agricultural department founded?—1895.

318. I have here 1892.—Yes, that would be the date of the founding of the agricultural department; I was thinking of the Cockle Park Experimental Farm, which was founded in 1895.

319. Would you describe the agricultural department of the college?—It is a department that takes up the question of scientific agriculture and teaches it. It has a professor of agriculture—there is a chair for that—and it deals with matters that appertain to agriculture throughout the North of England. They have experimental plots and stations that they control. It is governed by a committee of gentlemen who are interested in agriculture.

320. How are the gentlemen who form the committee appointed?—I think the Council of the college appoint them, but they are recommended by local agricultural societies or institutions like the farmers' clubs.

321. Does the college receive support from other counties besides the county of Durham?—Yes; it is connected also with the counties of Northumberland, Cumberland, and Westmorland.

322. A large number of agricultural students have passed through the college, have they not?—Yes; a good number.

323. An ever-increasing number?—Yes; they are increasing.

324. What becomes of the students who have been at the college?—There are more than 100 of them, I should think, who are in the counties farming their own land or their fathers' land, and there are several who hold appointments as experts in agriculture, and important positions in different parts of Europe.

325. They are trained as teachers, some of them?—Some of them are teachers.

326. The college is popular among the farmers?—It is getting more popular. In its early stages there was a prejudice against the teaching of scientific agriculture, but now I think that is being broken down, and the younger farmers particularly are appreciating the work of the college much more than they used to.

327. Are any fees charged to students?—For some of them there are fees, but there are others who are sent up by the County Councils by exhibitions.

328. As scholars?—As scholars.

329. What amount of preparation do the pupils receive before they join the college?—I cannot quite answer to what extent they are carried in the schools before they join the college, but they have to pass a certain standard of examination at the elementary schools.

330. Do they pass direct from the elementary schools to the college?—Many of them do. Some of them go into secondary schools, but several of them go from the elementary schools.

331. Is the supply of secondary schools sufficient?—No, it is not.

332. You think it ought to be supplemented?—Yes, by all means; it is very necessary.

333. Is it your opinion that secondary schools ought to be instituted specially for farmers?—No, I would not say specially for farmers; I should say for all classes.

334. You are satisfied with general secondary education?—General secondary education to take them a step above the elementary standard.

335. Can you tell the Committee what are the sources of income of the college?—For the general income of the college or for the agricultural department alone?

336. For the agricultural department of the college?—It depends almost entirely on the grant from the Treasury; there are a few subscriptions, not many.

337. You get grants from the County Councils?—Yes; we get County Council grants, of course. The County Council of Northumberland subscribe £500 a year; the County Council of Durham £500 a year to the chair; and the County Council of Cumberland £70 a year.

338. I suppose you want additional grants?—Very much so; they are very much needed, as the work is increasing.

339. Are practical experiments carried out in connection with the teaching of the agricultural department of the college?—Yes; we have a large experimental farm in Northumberland of 400 acres which the college supervises, and we have other plots of land in Durham and in Northumberland that are controlled by the college authority for experimental and research purposes.

340. Is the farm leased by the college?—No; the County Council of Northumberland are the tenants that lease it.

341. It is, therefore, under their immediate control?—Yes, it is; they are responsible for it, but out of the £500 grant given to the college.

342. They give the college authorities assistance in managing and directing it?—Yes.

343. Are those experiments watched by the farmers?—They are so now; but at first, as I say, they were rather prejudiced against them, but every year they are becoming more important, and the farmers are coming in large numbers to see the field experiments and to take notes, and I have no hesitation in saying that the farm is doing a vast amount of good in the neighbourhood.

344. Are any lecturers sent out by the college?—There were in the early stages a good many lecturers sent out, but I do not think they were the success that was expected, and there are not so many now; there are a few, but not so many.

345. To what do you attribute the want of success of the lectures?—The great difficulty was to get a practical man to deliver lectures; you got a scientific man probably who did not know much about practical farming, and the farmers did not have the same confidence in what he said; but we have had some lectures which have been very successful, and have commanded very good audiences of farmers.

346. Your opinion is that the staff of professors at the college and the staff of lecturers should be different—that different qualifications are required in a lecturer who is sent out to educate the farmers and to elicit their interest in education and in a staff concerned with teaching in a college?—I would not say that, because I think it is possible to get an intelligent lecturer and scientific man who may yet have practical knowledge, and the Agricultural Committee endeavour in making a selection to get a man who possesses those two qualities.

347. You would therefore lay stress on the fact that the lecturers should be practical men?—Yes, they must have been at practical work on a farm before they come and lecture to farmers. We are very strong on that point.

348. Can you give the Committee any information about the staff of the agricultural department? Of what does that consist?—Of course there is the professor of agriculture in the chair, and there is one lecturer who goes out to lecture occasionally under the direction of the professor, and I think there is the botanical, that comes under the staff of the agricultural department.

349. (*By Lord Barnard.*) Perhaps Professor Gilchrist will be able to give us that particular information in more detail?—Yes.

350. (*By the Chairman.*) Very well; I will leave that point. Are you satisfied with the way in which the money which you receive is used? Do you think, for instance, that the grant given by the Board of Agriculture and the grants given by the County Councils you have mentioned should be given for specific purposes—that they should be differentiated?—I think so; I think they ought to be given particularly towards agricultural education.

351. What I want to know is, whether, for instance, you would wish the grant of the Board of Agriculture to be given to the staff for the purposes of salaries, and then the grants of the County Councils for other purposes?—I think if the grant was given to the general fund, as at present, it would be the best way.

352. You would rather that the money was given without any definite purpose, and that the authorities of the agricultural department should be allowed to use it for whatever purposes they wish?—I think so. I think that would be the best way.

353. Have you adequate buildings for the purpose of this instruction?—No, we have not; we have a room in the college, but no separate building.

354. Therefore you are an absolutely integral part of the college?—Yes, we are one department inside the college.

355. Do the students, besides attending lectures at the agricultural department, also attend the general lectures given in the scientific department of the college?—I think they have an opportunity of doing so, but I do not know whether they do it regularly. I do not know whether their time is fully taken up, but they have the opportunity of attending lectures in the other departments.

356. Are the students who attend the institution chiefly sons of farmers?—Chiefly sons of farmers, or youths who are intended to become land agents or something connected with agriculture.

357. Is a record kept of what becomes of the students after they have left the college?—I am not aware of a record being kept, but we pretty well know what many of them are doing who have left the college.

358. What is the work conducted by the college which in your opinion is of the most value to the farmers in the district?—The work of research, I think, is the most valuable: experimental work, in trying to find out which is the best and cheapest way to grow crops.

359. To that you would give further development?—That might be developed with great advantage.

360. Are experiments made in breeding plants? Have you got anything in that direction?—In connection with the college there is a small plot of ground which, I think, is devoted to that purpose.

361. Is anything done with regard to forestry?—Yes, forestry has been much taken up of recent years; we have a large plot of ground for that purpose.

362. You have in the neighbourhood the opportunity of experimenting in forestry?—Yes, we have a very good opportunity now.

363. I suppose stock breeding, too, is conducted at the farm?—Yes, we breed stock at the farm, but only to a limited extent, not largely.

364. Do you know if attention is paid to dairying?—In Durham there is some experimental work carried on at Offerton Farm for testing the best kind of food to produce milk in dairy cows, and that has been of great value to the neighbouring farmers, who have been taking note of it.

365. Sheep breeding, I suppose, has also been carried on at the farm?—Yes.

366. (*By Lord Barnard.*) I think you are a Northumbrian?—I am.

367. You know the agricultural classes in the county of Northumberland pretty well?—Yes.

368. Personally, your business is that of the dairy and milk trade, and, I believe, in a very large way?—Yes, I am chairman of a limited company that has two very large creameries; one in Northumberland and one in Cumberland.

369. The population on both sides of the River Tyne is very large?—Yes, in the immediate vicinity of Newcastle it is very large.

370. The consequence is, there is a very great demand for milk?—A very great and a growing demand.

371. Therefore the milk trade is of the utmost importance for the welfare of the people as well as of the agriculturists?—Yes, it is very important.

372. The Northumberland County Council rent from the Duke of Portland, do they not, an experimental farm?—They do.

373. You are the chairman of that farm committee?—Yes.

374. The Northumberland County Council transfer the management of that experimental farm to the agricultural department of the college?—That is so.

375. You have a farm bailiff there who is a practical farmer?—Yes.

376. Your committee has meetings at the farm monthly?—Yes.

377. A very elaborate record is kept of all the experiments that are carried out?—Yes; it is very elaborately kept.

378. That record is widely distributed to the farmers?—Yes, and at great expense.

379. That is the work that the county of Northumberland contributes. The county of Durham has for a long time—although you do not perhaps know so much about Durham, I daresay you do know this—had under consideration a suggestion of obtaining a similar farm especially for dairy purposes?—Yes.

380. They have not been successful?—No.

381. In lieu of that they established the Offerton Dairy Research Station to which you have alluded?—Yes.

382. Farmers take a great interest in the dairy experiments?—They do.

383. Do you frequently go to Offerton?—I do not go myself, but I have all the records of the experimental work that is done there, and I take a great interest in it.

384. You can safely say, from what you know, that the work done there has been of great benefit to the farmers?—Yes; I can say that.

385. From your acquaintance with farmers in Northumberland you think they are beginning to take an increasing interest in the work done by the college?—I am sure that the new generation of farmers are taking much more interest in it.

386. Do you attend the local lectures yourself?—Yes, I have been to several.

*Mr.
T. Carrick.
1 May, 1907.*

Mr.
T. Carrick.
1 May, 1907.

387. From personal knowledge do you know that they are attended by farmers?—I may say there are more others that attend them than farmers perhaps. There are not so many farmers' sons there as we should like. At first there was a great prejudice against the lectures, but the lecturer that we have now who has just left the college is very popular and I think he has commanded a good many more farmers than his predecessors did. It depends very much upon the lecturer. If he has a practical knowledge of the subject he is talking about, the farmers' sons will come, but if he has not been a farmer and does not know very much about farming in its practical character they will not trouble to attend.

388. I think you know that the committee which governs the agricultural department of the college almost always in selecting their staff do *ceteris paribus* appoint men who have been brought up on farms and have a practical acquaintance with farming?—That is so.

389. That is the object the committee always aims at?—Yes, there is no doubt about that.

390. Do farmers in Northumberland usually send their sons to the elementary schools?—I think a large majority of them do. They have not the opportunity of doing anything else, many of them: there are so few secondary schools within easy distance.

391. Are the County Council of Northumberland considering the proposition of establishing more secondary schools?—Yes, we are; we need them very much.

392. The County Council of Northumberland are, I believe, afraid of any very large increase of rates, are they not?—Yes, they are very strongly opposed to that.

393. They have been more especially so than others, I believe; in fact, the assistance that they extend to you is somewhat precarious. Do you think they will continue to give the grant they are now giving to the college?—I am sorry to say it is rather precarious, in consequence of the increased cost of the County Council; and there has been a threat to reduce those grants. I should be very sorry if that ever took place.

394. As a person engaged in the milk trade, you have told us that you think the education given in a college such as this is of value to that trade; and I suppose you would admit it is of value to other businesses and trades also, such as millers, maltsters, land agents, seedsmen, and so on?—Yes, I think it is decidedly valuable.

395. (By Lord Belper.) I do not quite understand what the system is under which the other counties join you. Do they contribute only to the farm, or do they contribute to the college as well?—They contribute to the agricultural department of the college.

396. You say the college is managed by Northumberland?—The £500 that is given by Northumberland was given when the agricultural chair was established.

397. To establish the agricultural chair?—To establish the agricultural chair.

398. What do Durham and Cumberland contribute towards that?—Cumberland did not contribute anything at that time, but they have since given a contribution.

399. Would you explain to me what the system is now between the three counties?—Northumberland gives a contribution of £500, and the Council of Durham gives an equal contribution of £500—that was to establish the chair of agriculture. Cumberland and Westmorland, at that time, did not come in, but since that time they have given a contribution to the agricultural department along with the other two counties.

400. Is that managed by a governing body?—It is managed by the same body.

401. Are the other counties represented on the governing body?—Yes, on the agricultural department they are.

402. Had you any difficulty in settling the agreement between the counties? Some counties say there is a technical difficulty at present, owing to their having no power in their Act to form a joint governing body for the purpose of carrying on education of that sort. Have you had any difficulty in that respect?—We have not had any in the past that I remember.

403. Does one of the counties for all practical

purposes have the financial control—does it go through one body's hands, or is the whole county the governing power?—The agricultural committee of the college control the expenditure of the funds.

404. (Lord Barnard.) Perhaps I can explain that. I ought not to give evidence, but the agricultural department is not under the county at all; it is under the college. The college appoints representatives of all the counties which give contributions. The county of Durham sends so many members, the county of Northumberland so many, and Cumberland so many; but probably Professor Gilchrist can give all information about that.

405. (By Lord Belper.) Is the chemical department in connection with the agricultural department, or in connection with the college itself?—The County Council really is the direct tenant of the farm, but it is worked through the college.

406. You carry on all sorts of analyses and things of that kind in your chemical department—analyses of the soils and so on?—Yes.

407. Experimental work generally?—Yes; largely experimental work—in fact entirely.

408. You said also that you had a department of forestry?—Yes; a large department now.

409. Does the Government give any contribution towards that?—Yes; through the instrumentality of Lord Barnard, who succeeded in getting a very important contribution—£250—which is the largest contribution from any single source.

410. With regard to the question asked you about whether it was desirable to give a grant for some specific purpose which we understood afterwards meant according to the salaries that were given to the officials in the college or generally for the purpose of keeping up the agricultural department, I think you were not in favour of any alteration?—No; I prefer that it should be given to the department and allow them to distribute it.

411. It might be difficult to assess a grant fairly if you gave it merely on the ground of the salaries that were being paid might not it?—I think there would be a difficulty.

412. It would be an encouragement to institutions to give extravagant salaries in order to get a larger grant from the Government?—The college committee would have to give a sufficient salary in order to get capable men for the department; it is very important that we should have capable men.

413. Yes; but if the institution was to benefit in the way of grant by giving larger salaries that might induce them in some cases to give larger salaries than were necessary?—I do not think so.

414. You do not think if you can put £200 into your pocket by giving £100 to somebody else that that would not very likely be the effect of the transaction?—I do not think it would have that effect.

415. Why?—A committee of sensible gentlemen would not begin to give money away just because they had it to give.

416. If they obtained more by giving it away and they were short of money might not it be so?—Perhaps they would be able to command a higher class of staff then.

417. I am taking it for granted that they would get properly scientific people, but if the grant that they got from the Government was given solely on the amount that they gave away in salaries might not it have the effect of making them a little liberal with their money in giving their salaries in order to get a larger amount for their institution?—I think it might have the effect of developing the work in the various directions in which it needs developing without increasing the salaries.

418. Then you are in favour of giving the grant according to the salaries paid, are you?—I am rather in favour of giving a grant to the committee to expend it in the best manner.

That is what I thought, but I understood that you were now rather arguing in favour of giving a grant based according to the salaries paid, and that was the question that I thought was asked you.

419. (By the Chairman.) I may perhaps explain. The point is this; you have two colleges, we will say, one with an efficient and complete staff, and the other with a less efficient and less complete staff. In

Mr.
T. Carrick.

1 May, 1907.

that case it is obvious that the college which has an inadequate staff would desire to see its grant increased to the same level as the other college in order to bring its staff to the proper standard.—That is so.

420. It is not a question of giving it according to salaries, for, of course, no Government Department would encourage any institution to give salaries above a proper standard. But the point is that in the distribution of the grants by the department it is obvious that it would be to the advantage of the college to receive a grant in accordance with the efficiency and the completeness of its staff.—I should say it is very desirable that there should be a very efficient staff all round.

421. (*By Lord Belper.*) I think anybody would agree that it is desirable to give a grant according to the efficiency of the college; but the question is, if you take the amount of the salaries paid as the basis of the grant, might not that have the effect of giving a larger grant solely on the ground of the salaries that were given?—If the salaries were low, that, I think, would not be fair.

422. That, of course, is another point. They might get a staff at a lower salary in one part of the country than in another.—I might say that we have felt very much that we have been underpaying our agricultural staff at the college, especially the professor of agriculture. He has been underpaid for years and has worked very hard, and the committee have felt very keenly indeed that it was a great pity he should have such a poor salary.

423. I suppose everybody would agree that it is absolutely essential, for such institutions, that you should have the most efficient staff you can possibly get?—Certainly.

424. The only point I want to make is, as to whether the mere standard of salaries, being taken as the basis of the grant, would tend to encourage the increasing of the salaries of the staff. I was putting to you, would not other considerations come in, in order to prove whether the staff was efficient or whether it was not?—Yes, that is so, but I think it depends upon the level on which you have paid your staff up to the present time.

425. I do not want to suggest anything with regard to how it is done at the present time. I only mean that in trying to get at the efficiency of the staff, there may be other considerations besides the actual salaries they receive?—There are other ways of extending it.

426. Yes, in fact there must be other ways of extending it?—Yes.

427. (*By Lord Moreton.*) There is one point I did not quite understand as regards the dairying. You mentioned the Offerton Dairy Experimental Station?—Yes.

428. What facilities do the students have for learning dairying at the college?—We have none at the college at present unfortunately.

429. There is one other question I should like to ask, which, perhaps, it would be better for me to put to Professor Gilchrist, when he comes. It is this: what does it cost a student to come to your college. Take a farmer's son coming up for a long course—I see you have two courses, a long and a short course?—Yes.

430. Can you give us an idea what it would cost a farmer's son to come up for a long course, and for a short course?—I think, perhaps, Professor Gilchrist could answer that question better than I.

431. (*By Mr. Staveley-Hill.*) Are any lectures given for the teachers in your elementary schools?—No, I do not think any teachers have instruction. On the summer afternoons at one time they had the opportunity of attending lectures.

432. As a general rule they do not do it?—No.

433. Do many farmers in the district apply to the college for advice?—They go to the professor. I think he has a very large number of letters asking for advice.

434. Is that an increasing number?—It is an increasing number. Farmers get the bulletins of our work that is carried on at the farm, and they very often write to the professor for information. I think it is most valuable to farmers.

435. Do you charge any fee for that information?—None at all.

436. What is the proportion of time given by the students to practical work as distinguished from

scientific teaching?—There is no practical work at the college.

437. Not out on the farm?—The students are only occasionally taken to the farm; they do not do any work there.

438. Are these pupils acquainted with agriculture or are they entirely ignorant of it when they come?—The six weeks' course students are farmers' sons who have mostly a good knowledge of agriculture.

439. What do you say with regard to the long course?—Some of them know something about it, but most of them do not have much knowledge of farming.

440. (*By Prof. Middleton.*) You said that some of your students came from primary schools—you mean, of course, the short-course students?—Yes, chiefly short-course students.

441. Then you referred to the fact that county lectures have recently become much more popular in the county of Northumberland than they previously were?—There have not been a great many of them, but those that were held have been more fully attended than they were previously.

442. You speak principally for Northumberland—you are not personally concerned with the county of Durham, are you?—No, only from what I have heard.

443. You know that the county of Northumberland tried lectures in the early days, and it then decided that it would give attention to experimental work on the Cockle Park Farm until it had accumulated certain experimental evidence, and it was part of the policy of the college not to offer lectures in the county of Northumberland for a certain number of years until that evidence was collected?—They were not given to any great extent.

444. During the whole of that time lectures were given in the county of Durham?—I believe they have been for some years.

445. You cannot say, except from hearsay, whether those lectures in the county of Durham were successful or not?—I cannot speak of that.

446. You refer to Northumberland principally?—Northumberland I know, and Cumberland.

447. Your experience among farmers is this; that the work that has appealed to farmers most and that has taught them most has been the experimental work?—Undoubtedly—things that they can see for themselves such as the crops growing, and so on, are most attractive to them.

448. (*By Dr. Somerville.*) You and I have been associated in this work for a great number of years, I think?—We have.

449. May I ask you what is being done in the county of Northumberland now to provide for the requirements of what I may call the rank and file of young farmers?—There is nothing being done more than the experimental work we are carrying out on the farm and occasional lectures and facilities given for the six weeks' course at the college for young men.

450. You have not started in Northumberland a system of local centres for the lower and less advanced forms of agricultural education?—No, I am not aware that any has been started yet.

451. There was a proposal, was there not, to establish secondary schools with agricultural sides at such centres as Morpeth, Hexham, and Alnwick. Has that not been proceeded with?—No, nothing has been done yet. Of course these secondary schools are going to be erected, and very probably there may be agricultural sides to them, but not much advance has been made yet.

452. Do these young farmers that are sent from Northumberland to the college in Newcastle get the advantage of small county scholarships?—Yes.

453. Do you remember how many of these scholarships are annually awarded?—I am not quite sure. Professor Gilchrist may know the figures exactly, but we are trying to get more money than we have done for scholarships. We think it is a very good way of inducing the young farmers to go to college.

454. In your capacity as chairman of the Cockle Park Farm Committee, have you had conclusive evidence from practical farmers in Northumberland that they have been assisted in their business by the education

Mr.
T. Carrick.
—
1 May, 1907.

that has been supplied, and by the experimental results that have been forthcoming?—I have had several gentlemen who have given me proof that they have got great benefit by going to the farm and seeing the experimental work carried on there, and also by reading the reports of the farm. Those reports have been of great benefit to them; several practical farmers have told me that.

455. The farm is maintained, I think you said, entirely by the county of Northumberland, supplemented by an imperial contribution?—That is so.

456. What amount of financial assistance does the county of Northumberland now provide?—£600 a year.

457. A definite sum of £600 a year?—A definite sum of £600 a year.

458. That is supplemented by £200 a year from the Board of Agriculture?—Yes.

459. These contributions are over and above any profit, if we may call it so, that you obtain from the ordinary working of the farm?—We cannot make a profit from an experimental farm; we make a considerable loss, but we succeed in carrying on the work within the amount of the grant.

460. So that in point of fact it takes the most part of £800 a year to run the farm?—Practically, that has been the average cost of working.

461. The conclusion you have arrived at, supported by the evidence of practical men, is that the money is well spent?—Undoubtedly; it is very well spent.

462. A Committee of Enquiry, if I remember rightly, looked into the position and results of the farm in Northumberland, did they not?—Yes. They took a lot of evidence from large and small farmers and made a report to the County Council. I may say there was a small minority of the County Council that objected to this expenditure of £600 a year, so this enquiry was held and they reported to the County Council. It came before the County Council and was debated at length, and the vote in favour was carried by 40 against 10, who thought it was undesirable.

463. That result was arrived at after taking evidence, I suppose, both from those who were opposed to the idea of the county farm, and also from those who were in support of it?—Yes, they took both sides; the evidence was taken very carefully, I believe.

464. I think also in the county of Northumberland you give a considerable amount of attention, do you not, to horticulture?—Yes, that has been developed very largely recently, and that is a very useful education.

465. Do you find that horticultural instruction in the local centres is well supported?—It is better supported than it was. It is like other matters in agriculture; it was not at first so much supported, but now the local gardeners are taking great interest in it, and we have a very good man who comes and gives us lectures on fruit-culture and pruning and that kind of thing. It is very much appreciated now.

466. Do you think that horticulture affects a larger number through the agency of local instruction than would be the case, for instance, with agriculture?—Yes, it does.

467. The audiences are better?—You get a larger number of gardeners and cottage gardeners and others.

468. Are you convinced that this agency must have a considerable effect upon the prosperity of the minor cultivators?—I think it is most useful information, and it gives the young people an interest in gardening. In the village in which I live there are 18 plots; the elementary scholars each have a plot, and they are taught by the schoolmaster, who takes an interest in gardening; and when our County Council instructor comes up to give his demonstration they are always most eager to get information, and I am sure it is having a very good effect in our villages.

469. So that the form of organisation takes the lines of a county demonstrator, and of instruction in the elementary schools?—Yes, controlled by the Education Department.

470. That is, as regards the instruction in elementary schools?—Yes.

471. Does the instruction which is supplied come under the Education Department?—They pay a portion of the teacher's salary.

472. (By Mr. Medd.) Does your Committee consult the Board of Agriculture at all when formulating its annual scheme of education for the county?—No.

473. Would your Committee be prepared to submit a scheme to the Board of Agriculture for advice and suggestions?—I do not see why we should not submit a scheme for advice and suggestions, but the local committee would have more knowledge in initiating a scheme.

474. The advantage might be that the officials of the Board of Agriculture would be familiar with successful experiments in other counties, which they might explain; that is all. I should not suggest that the Board in London should exercise control over you, but merely bring their knowledge within your reach more directly?—I think that might be very useful and desirable.

475. I notice that your grant last year out of the "whisky money" for agriculture was £798 out of £7,456; was that amount larger or less than in previous years?—A little less.

476. Do you know why?—In consequence of the decreased grant to the county because of the whisky drinking.

477. Not, you think, from any disinclination to continue support for agricultural education?—No, I think not.

478. In answer to Lord Reay, you said you were satisfied with the general secondary education?—I think there is great need for more secondary schools.

479. You were speaking, of course, with a view to the preparation of students for the Armstrong College?—Yes, as a step from the elementary school to the college.

480. You want your students at the Armstrong College to have a thorough foundation in general education?—Certainly.

480A. Now, with reference to the small farmer and the labourer—what Professor Somerville called the rank and file. In Northumberland you have no permanent institution for intermediate agricultural education, have you?—No.

481. You only have these short courses?—That is so.

482. You have not yet, I take it, established any secondary school with an agricultural side?—None at all.

483. You are probably aware that the schools at Ashburton in Devonshire and Wellington in Somersetshire, with agricultural sides, failed?—I am not aware of that.

484. They did as a matter of fact. In Ashburton in Devonshire the school was conducted under the very best conditions, but it has proved impracticable. Have you had any experience of an intermediate agricultural school in any other country—have you seen one?—I have seen them on the Continent; I have seen them in France and I have seen them in Switzerland.

485. From what you saw of them in France, should you consider that a type of school adapted and suitable for the sons of small farmers who could attend from the age of 13 or 14 to the age of 17?—I think they are very suitable indeed.

486. It is merely a question of money and organisation?—Yes.

487. If it could be established it is probably the most effective way of attracting and improving the small farmer?—Undoubtedly, if you could have practical farming carried on along with it—experimental stations.

488. The absence of that grade of education is not for any want of belief in it, but for want of money?—That is so.

489. Do you do anything for the labourer himself in the continuation schools?—He has the opportunity in many parts of the county of attending evening classes; there are no continuation schools really that I know of.

490. You have not, of course, anything in the nature of a technical day school, have you?—No.

491. In your continuation schools you give no instruction in any agricultural processes?—No, not that I am aware of.

492. Have you ever tried a class in the management and construction and repair of farm machinery for instance?—No, not to my knowledge.

493. Such a class would be valuable, I should imagine?—Yes, perhaps it might be, but it has not been tried.

494. I dare say you have never heard, or you may not have had personal experience of what I may call boys' agricultural clubs?—No.

495. They only exist in the United States; you have never met with them?—No.

496. As an organisation distinct from a school but as a method of attracting and educating farm lads?—I do not know anything of them.

497. You do find difficulty in retaining control over or influencing in any way the farm lads after they leave the elementary school?—Unfortunately, we have not any system by which we can control them or assist them.

498. It is very largely a matter of money?—Undoubtedly.

499. Not from any disbelief in the value of it?—I think not; I think that there could be such centres established where it would be made attractive to these lads, and where they might be got hold of and made useful.

500. Do you come into contact at all with the official correspondents of the Board of Agriculture?—That is to say, the local correspondents?

Mr. Medd. Perhaps Mr. Middleton can tell me how many correspondents they have in Northumberland?

Professor Middleton. Probably four or five I should think.

501. (By Mr. Medd.) Do you know anything about them?—Yes; I know the gentlemen who correspond with the Board of Agriculture.

502. Do they act in any way as a conduit pipe between you in Northumberland and the Board?—No.

503. Have you ever formed any opinion as to the advisability of a permanent consultative committee being formed in London which should consist of representatives from each county, and meet periodically to discuss matters of agriculture and agricultural education?—I think that would be very desirable.

504. You have, I believe, several successful co-operative societies in Northumberland?—Yes.

505. How do you find co-operation works; does it in any way stimulate a demand for education?—I have not seen any marked effect.

506. As soon as a man begins to realise that a profit is to be made out of land by co-operation he will want to learn how that profit by education might be increased?—The co-operative societies are mostly situated in large centres of industries in large towns. We do not have them in the rural districts, so that it does not apply so much to agriculture.

507. (By Lord Barnard.) There is one question I ought to have asked you before, Mr. Carrick. Is there a large importation of foreign dairy produce into the Tyne?—Very large.

508. Butter principally?—Yes.

509. Is there any milk?—Not much to the Tyne; scarcely any I think. It comes to Southampton, I believe, but not to the Tyne.

510. Cheese?—Cheese to a large extent from America.

511. But butter, principally from Scandinavian ports?—Yes.

512. (By Mr. Lamont.) Arising out of that, you were speaking as I came in about creameries; I think you said you were connected with two creameries? Are those in any way connected with the Armstrong College?—No; not in any way. They belong to a limited company.

513. Could they be adapted in any way for the use of the students?—At one of the creameries connected with the company I am chairman of we do allow the agricultural students of the Armstrong College to come there and take lessons in butter-making, and they get certificates.

514. Where is that creamery situated?—In Cumberland, about 12 miles beyond Carlisle.

515. Is there anything done there in the way of keeping a register of the yield of milk from each cow?—In Durham, at the Offerton Farm Dairy, there is a very carefully kept register.

516. And no doubt the breeding of your cows is carried out in some degree in connection with their milk yield?—No doubt; that is a very important thing.

The Chairman. We are very much obliged to you for your evidence.

Mr.
T. Carrick.
1 May, 1907.

Professor DOUGLAS A. GILCHRIST, M.Sc., F.R.S.E., called and examined.

517. (By the Chairman.) You are Professor of Agriculture and Rural Economy at Armstrong College, Newcastle-upon-Tyne?—I am.

518. You have had large experience of practical farming as well as in teaching and examining?—That is so.

519. You have also visited the research stations and colleges in Canada, Germany, France, and other countries?—Yes.

520. Do you consider that better circulation of information is wanted in this country, and the distribution of the new varieties of seeds, as in Canada?—I think that this is exceedingly desirable. The amount of matter that is sent out in a country like Canada is certainly far more effective because of the thorough means of distribution there is there as compared with what there is in this country.

521. Do you wish that information to be distributed by the Board of Agriculture to the local authorities?—Yes, either by the Board of Agriculture for general information, or by the colleges for local information.

522. With regard to veterinary science, is it your opinion that that is sufficiently provided for?—No; I am speaking now of Armstrong College in particular. We have no definite provision for instruction in veterinary science at present. We have a lecturer in agricultural zoology, but we have no distinct teaching in veterinary science.

523. Do you think that provision for veterinary science should be made at the college?—Yes, as veterinary hygiene.

524. The provision for teaching estate management is very inadequate?—Yes; we have a special opportunity

just now of developing the teaching of estate management at Armstrong College, because the Surveyors' Institution has placed at our disposal three scholarships worth £50 each for three years, and in addition we have a considerable number of intending land agents attending our classes at present, and that branch of the work could be very considerably developed. We are not fully efficient, so far as the teaching staff is concerned, in that branch.

525. You want a further development of that teaching?—Yes.

526. Who gives the teaching at present?—The lecturer on agriculture has been giving the teaching during the present and the past sessions.

527. Has he any practical experience of estate management?—Only to a small extent. At the same time he knows the work very well indeed, and so far as it has gone the class has been conducted in a very satisfactory way.

528. Is there sufficient provision for dairy instruction in the counties of Northumberland and Durham?—We have at present the Offerton Dairy Research Station, which is practically for dairy research. At this farm (over 400 acres), we have the use of a herd of more than 50 milch cows. There is also a travelling dairy school in the county of Durham, which is managed directly by the Durham County Council. At present 12 of the best pupils from these classes come to Newcastle every year for a course of instruction in dairying. At present we have not full facilities for giving that instruction, and no building for doing so; we have simply got a temporary place, and my opinion is that it is exceedingly desirable that some permanent provision should be made for some central teaching of

Prof. D. A.
Gilchrist.

dairying for the counties of Northumberland and Durham.

529. Will you tell the Committee your opinion with regard to the relationship between the staff of the college and agriculturists in the counties connected therewith?—My opinion is this, that taking a group of counties such as Northumberland, Durham, Cumberland and Westmorland, first of all one can easily see that we have got eastern and western conditions, a very great variety of soils, and very considerable differences in farming, and it is all-important that the staff of an agricultural department like ours should be in thorough touch with the different branches of farming, and should have a practical and scientific knowledge of the soils, and be able to give advice to farmers with whom they come in contact; and in that way the work that we are now doing in investigating the soils of the different counties—we have done more at Cockle Park than elsewhere—and in collecting all the local information that we can, does put us in a much stronger position for giving advice, and it is very desirable, I think, that that side of the work, which should include all branches of agricultural research, should be developed.

530. I think you receive applications from farmers, and that those applications are encouraged by members of the staff travelling in the counties?—Members of the staff travelling in the counties receive a large number of verbal applications and give the advice right away, and in addition we have over seventy written applications every year asking for advice of a more elaborate character. This work, I am certain, could be greatly developed, and with great advantage to the agriculture of the counties, if our research work were extended and carried even more to the farmer than it is at present.

531. You would increase the number of stations where research was conducted so that the farmers would have easy access to those experiments—is that what I am to understand you mean?—Perhaps the best way I can put it is that I should develop, as far as possible, the central stations like Cockle Park and Offerton, and the stations in Cumberland and Westmorland, and then have in addition small demonstration plots at suitable centres, to demonstrate these lessons throughout the counties.

532. We, in this country, are not as well equipped as foreign countries and Canada to undertake the kind of agricultural research that you have just described, are we?—No, we are nothing like so well equipped.

533. The proportion of farmers who receive a scientific and business training as agriculturists is not very large, is it?—The proportion at present is very small indeed. I think the country generally has made remarkable progress, because less than twenty years ago little was done, but the proportion as yet is not nearly what it should be of those who do receive definite scientific and business instruction in agriculture.

534. The students in the agricultural department of your college, obtain degrees and they obtain certificates. Would you explain to the Committee what are the conditions under which the degree is obtained, and what are the conditions under which the certificate is obtained, and how the students are differentiated; for instance, whether a farmer's son gets a certificate and a landowner's son gets a degree, or do farmers' sons also attempt to obtain degrees?—I may say shortly that we can roughly classify our courses into long and short. First of all, taking the long courses, these again may be differentiated into three types: first, the degree course which extends over three years—for three full sessions; secondly, the diploma course, which, till two years ago, was called the certificate course, which extends over three winters; and thirdly, we have a considerable number taking courses of their own—a selection of the classes in agriculture, dairying, forestry, or estate management, some for one winter, some for one session, and some for longer. With regard to the class of student for the degree in agriculture the majority who have taken degrees are farmers' sons, but we have at present a graduate of Oxford who is now working for his degree in agriculture, and specializing in forestry. We have a few who are working directly for, or have gone in for land-agency, and with regard to the diploma course they are nearly all farmers' sons. Then, passing from the long courses to the short courses, those who take the farmers' course, usually about 20 every year, are practically all farmers' sons from

Northumberland or Durham, and those who take the short courses in dairying are practically all farmers' daughters from the county of Durham only, because the county of Northumberland is not doing any dairy work at present. Our dairy students, therefore, all come from Co. Durham. I should say we do not get dairy students from Cumberland and Westmorland, because in those counties they go to the Newton Rigg School, but we get agricultural students who come from those two counties, some of them being with scholarships from this school. There is one question I do not think I answered completely. We do get sons of city men, and when they decide to take a course of agriculture we always advise them to spend some time on a farm before coming to us, at least a year, and to spend their vacations—especially those taking the diploma course—on a farm while doing so, and we find those who do so are better students and take a greater interest in the work.

535. Is a degree or a diploma considered of higher value?—No doubt the degree is of higher value. The degree means taking a full three years' course, and is practically of as high a scientific value as a degree in pure science of Durham University. Perhaps I should just explain that Armstrong College is a college in Durham University, and that the degrees in science in Durham University are amongst those open to the students of Armstrong College.

536. Is the course for the degree and the course for the diploma identical in length?—No; the course for the degree extends to three years of three terms in each year—the two winter terms and the summer term. The course for the diploma extends to three winters only, so that it includes in all six terms, whereas the course for the degree includes nine terms. In addition, those taking the degree must pass a rather stiff preliminary examination, whereas those taking the diploma have no such examination.

537. Do students for a degree require more preliminary grounding than the students for the diploma?—Yes: and they take fuller courses, especially in pure science, than the students for the diploma.

538. (*By Lord Belper.*) Do I understand, that the certificate is the same as the diploma? The two terms have been used; are they the same thing?—Perhaps I can make that clear. Up to two years ago we had a certificate course, and we then changed the name to diploma; that is the reason I mentioned the two names.

539. (*By the Chairman.*) Is the amount of preparation which the degree students have received sufficient?—That is sufficient. Our difficulty is to get them to pass that examination.

540. Are you of opinion that there are sufficient secondary education schools and efficient secondary schools in order to prepare for the degree course?—No. We have now got a stiff entrance to our degree examination, and unfortunately we have not got the schools to provide for it. At present, most—not most, but I think, certainly a good many of the young fellows who come to us—have been to the North Eastern Counties School at Barnard Castle, and at that school they have got an efficient staff for this purpose. In Northumberland there is no such school and a considerable number of the Northumberland farmers' sons go to the North Eastern Counties School at Barnard Castle in the county of Durham.

541. Therefore you consider there is a need for such a school in Northumberland?—That, I believe, is so.

Lord Barnard. As I am one of the governors of the Barnard Castle School, perhaps I might say that although it is locally situated in one county, it really belongs to three besides Durham, Northumberland, Cumberland and the North Riding, and boys from each of those three counties are available at lower rates, so that in addition to Durham it serves those three counties.

542. (*By the Chairman.*) You would not find in France, or in any part of Denmark, an area of the extent of those three counties, without a sufficient number of secondary schools being of easy access to the population?—That is so.

543. How about Canada?—When I was in Canada, seven years ago, I know that a very important School was being built in Montreal. That, I believe, is now very fully developed, and what I was especially pleased to find in Canada was, that the old Scotch system of the farmers' sons going to the elementary schools

still holds good, and many of them get a very good education in those schools.

544. Your opinion is, that there is a great need of more extended secondary education?—That is so, undoubtedly.

545. You are in favour of that secondary education being general, and not having specific secondary agricultural schools as preparing centres for the degrees?—I should not answer that either one way or another. I have examined the Dauntsey Agricultural School in Wiltshire. That school is doing excellent work, and for farmers who can send their sons to a school like that there could not be a better school. But, perhaps, I may say this, that there are large market towns, and the smaller farmers round those would send their sons to secondary schools if they were there, whereas in many cases they could not afford to send them to a boarding-school where the cost would be so very much greater.

546. Do you think that if secondary schools were established, and you added an elementary agricultural side to them, it would attract the farmers' sons more than if you had a secondary school on general lines?—I hesitate in answering that because the cost of adding an agricultural side for a few pupils makes it exceedingly difficult to carry out, and I would much rather have a strong secondary school without the agricultural side, than a weaker secondary school with a weak agricultural side.

547. You are afraid that if an agricultural side were added the expenditure would be prohibitive?—Ideally I am in favour of it, but the cost and the difficulty of making the agricultural side efficient in a large number of schools is so great that I do not think it is possible.

548. There is, of course, another class for whom such a school would be intended. You have students going to the secondary school with a view afterwards of joining a college, but there must be a large number of boys in the rural districts who could not frequent school beyond the age of 16, and for them you will admit that it would be desirable to have secondary schools such as, for instance, have been established for years in France?—That would be so.

549. You would be in favour in the higher elementary schools of that class of boys being provided for?—Certainly.

550. How long do the short courses take?—The course for farmers' sons is held annually before Christmas, and extends for six weeks; it is held continuously. The course for dairy teaching up to two years ago extended to six weeks; now it extends to eight weeks.

551. That is in winter?—That is now in spring; it commenced a few days ago, and it is going on for eight weeks from now. It was in winter up to two years ago, but it has been altered now to the spring.

552. You are, of course, aware of the winter schools on the Continent?—Yes.

553. Would such a school do you think succeed here in a centre?—I think a development of our winter's course for farmers' sons would be much more effective, and certainly so in our district in the North, than the establishment of a winter school.

554. Do you think that those who frequent these short courses would be prepared to frequent what I call a winter school?—I have always in the examination at the end of the farmers' course had an oral examination, and most of them have expressed a wish to come back, but we have no scholarships for a single winter's course, say, of 20 weeks, and only a few of them have come back. I should very much like to see out of the 20 about one-third of the best of them coming back, and encouraged to come back, say, in the following winter for a one-winter's course, say, of 20 weeks. At present Lord Barnard provides one such scholarship from his estate in Co. Durham.

555. You think a winter course backed by scholarships would be a success?—Yes, and not only a success but of the greatest advantage to the agricultural population and agriculture generally in the North of England.

556. Is the staff of the agricultural department of your college adequate?—I think I have indicated our weak points in what I have already said about estate management and veterinary science. In those directions it is not adequate at present.

557. I see you have given us the amounts of the grants from the County Councils. I do not think I need ask you about that; that can be inserted and we can take that as read. The great bulk of the students both for the degree and for the diploma are farmers' sons?—That is so.

558. I see you say probably over 85 per cent?—Yes.

559. The short courses in forestry are taken by apprentices in forestry—I suppose by men who want to be foresters?—Yes. I omitted to mention that we have a short course in forestry, and that those taking that course are practically all apprentices in forestry.

560. In the dairy courses they are practically all farmers' daughters from the County of Durham?—Yes, practically all farmers' daughters.

561. I see that there are also a fair number of the sons of city men. What is their object in taking the course? Is their object to become surveyors or estate managers?—A number of them intend to become farmers, and one or two are actually farming now after having taken a course with us. Some intend going in for agricultural appointments, and a few for estate management.

562. What are the additions to the staff that you advocate? I see you give us the staff. You mention the staff giving whole time and the staff giving part time. What are the additions to the staff that you consider most urgent?—With regard to the staff, at present our staff includes a professor of agriculture, and a lecturer in agriculture. I may say the main duties of the lecturer in agriculture are to give extension lectures to farmers throughout Northumberland and Durham. Then there is a lecturer in agricultural chemistry, and a demonstrator in agricultural chemistry, who, owing to the tightness of our funds, is paid from the general funds of the college at the present time. The college has very kindly come to the assistance of the department in this way. There is also a lecturer in forestry, an agricultural zoologist, and although we have an instructor in horticulture who gets £110 a year, his salary is provided for by the counties of Cumberland and Westmorland, and he does not give any time to college work. So that if we did develop the horticultural work in the college something would be needed for that work. Then there is a prize demonstrator in agriculture, who receives £60. Formerly for that same position £120 was given, and £60 is not adequate for this purpose; that certainly should be larger. We pay part of the stipend of the professor of botany, £70, and part of the salary of the demonstrator in surveying, £60, while the arrangements we have for the classes in pure science, mathematics, chemistry, physics, geology and natural history are that they are open to the agricultural students on condition that the department hands over the usual fees in connection with those classes to the general college funds. Where we certainly are weak at the present time is that we have no direct provision in connection with estate management; that is done at present by the lecturer in agriculture, but better provision is required for that subject and we also have no lecturer in veterinary science in connection with the work. These are directions in which the staff should certainly be strengthened.

563. Are special arrangements made for the training of teachers in agriculture, or do you consider the degree course is sufficient for them?—The degree course we recognise as being a training for those who intend to become lecturers in agriculture either in the Colonies or in this country or abroad.

564. You do not think any additional arrangement should be made for training teachers?—There is one side of the work advisable that I think is included in your question, and that is giving a certain training in agricultural science to elementary teachers; we have no provision for that at the present time.

565. You have no courses for them?—There are no courses for them; and I think it is very advisable that something should be done in connection with agricultural teaching in that direction.

566. You think the elementary teachers would be quite ready to attend those lectures if they were given?—I think with suitable organisation that there would be no difficulty in getting their attendance.

567. What is the difficulty? Why has nothing been done in that? Is it financial?—I think it is very largely financial. As a matter of fact the Agricultural

Prof. D. A. Gilchrist.

Prof. D. A.
Gilchrist.

1 May, 1907.

Committee of the College have taken the most important things to deal with, so far as their finances would allow them to do so.

568. Have you yourself given lectures in the neighbourhood to farmers?—Yes; I have given a considerable number throughout the four northern counties.

569. What was your experience with regard to the attendance at those lectures?—It has been very satisfactory.

570. Are sufficient lectures given? Is the system of lecturing at present organised in the counties?—In the county of Durham the lectures to farmers have always been a great success, and upwards of 40 have been given every year for a considerable number of years. In Northumberland, owing to financial pressure and to the money being spent in other directions, they have not been organised to the same extent. Probably there is another reason also. I should say, although Northumberland is a county much bigger than Durham, yet it has a smaller number of farmers; in other words, the farms are much larger, so that it is more difficult to get a class at many of the centres in Northumberland than it is in Durham. At the same time I am quite convinced, from the success of the lectures we have had, that that work could be considerably developed with advantage in the county of Northumberland.

571. Then your experience is that where the farms are smaller, and therefore a greater number in a smaller area, it is more easy to obtain an audience than where there are large farms and therefore the area of population is more scanty?—That is so.

572. I see that local field experiments are carried out at over 40 centres throughout the four northern counties?—Yes, we have over 40 centres for carrying these out.

573. Who takes charge of each centre?—The general division of work at present is that I am responsible as director at Cockle Park and take the general supervision of the local experiments in Northumberland and Cumberland, and the lecturer in agriculture has for the past three years undertaken the supervision of those going on in County Durham and in Westmorland. Then our demonstrator assists us, and in addition we have a gardener at the college who is a very intelligent man, and who sees to the manures, and either he or the demonstrator in agriculture always goes to each centre to see the manures applied, the crops weighed, and to supervise work of that character. What is very important is that we secure a centre, in many cases an old student of the college who is farming, and we always make certain to get a good farmer on whose farm to have the experiments, and a farmer who is naturally likely to be interested in the work and to carry out the local work cheerfully.

574. Those field experiments are watched with great interest by the farmers in the district?—Most of them are watched with very great interest by the farmers in the district. I may say some of them watch with very critical interest, but on the whole the results, so far as observation is concerned, are very satisfactory.

575. The farmers utilise the results which are obtained?—That is so to a large extent.

576. (*By Lord Barnard.*) I should like to ask you one or two questions about the secondary schools. I will confine what I have to say to the county of Durham, with which I am best acquainted. Can you tell us any district which is not provided with a secondary school in that county?—I cannot think of one. I am afraid I have not got such a knowledge of the county of Durham in that way as I have of Northumberland. No; I cannot tell you.

577. You will take it from me that, at any rate so far as South Durham is concerned, at every market centre—Darlington, Barnard Castle, Hartlepool, Durham—there is a secondary school in every one of those towns, and even up in the north district. You will take that from me?—Quite.

578. Will you also take it from me that an enormous number of children go by train to those schools from the more rural districts?—Yes; I have travelled with a considerable number of those children going on the Barnard Castle line and on the other lines.

579. Can you tell me of a single district in the county of Durham which can be properly called a rural district, that is to say, which is not affected by mining or ship-building or something of that kind—chiefly mining and

quarrying, of course?—The district of Upper Teesdale has got a certain amount of mining, but still the mining in some parts does not alter its rural character. All the miners at the same time do agricultural work. Then the district from Wolsingham going west towards Alston includes a considerable rural district, with mining at each end, but there is no large rural district in County Durham.

580. There is no purely rural district?—No; I might say in connection with that that all the better land is in the busy industrial districts in the county of Durham, and the quieter parts of the county are mainly in the moorland country to the west.

581. Can you give the Committee any idea as to the size of the farms in the counties of Northumberland and Durham. Should I be right in saying that there are no enclosed farms practically—of course I do not include moors—in the county of Durham of over 500 acres?—I know there are very few; I am speaking from memory. I think there is one certainly between 500 and 1,000 acres.

582. Yes?—But I know there are not many over 500 acres.

583. At the other end in the Weardale and Teesdale district and the Dale county generally, there are a large number of farmers who are either themselves or their families engaged in lead mining and quarrying as well?—Yes, there are a very large number.

584. That leads me to another point that has been touched upon in this enquiry—the question of labourers. On the Dale farms there are practically no labourers at all. I mean the man and his wife and family do practically all the work themselves?—Yes, the man and his family do all the work. I might add generally that every member of the farmer's family is a labourer as a rule—they are working farmers.

585. Farm labourers in the North of England are in a very different position from what they are in other parts of England, in consequence of the system known as the hirings, and the general practice of farm labourers to move every year?—I do not know that side of it so much, but I do know that the wages paid to the farm labourers in Northumberland and Durham are very much higher than they are in the southern and midland counties, and that the efficiency of the labourer is also considerably better.

586. You are not aware of the fact that the farm labourer is a yearly servant in the North-east of England as a rule, are you?—Yes, I know that; and, further, he is paid for his whole time; whereas, in many of the southern counties some of them are engaged for part of the year and not engaged fully in the winter months.

587. There is no settled population of the labourers in the north-east?—Not to farms but to districts.

588. One question as to the size of the farms in Northumberland. They are large farms there except up towards the moors?—Yes, the farms are very much larger, especially in the north of Northumberland, taking the Wooler district up to the Tweed and all the Belford district.

589. It is also very highly farmed?—Yes, it is a well farmed district.

590. Cumberland is more of the same type as Durham—amongst the hills at any rate?—Yes. Of course, there is a much larger number of statesmen—men who own their farms—in Cumberland.

591. Yes. I should like to ask you one or two questions in consequence of a question that Lord Belper asked the last witness about the college itself. The college is a very large and progressive institution?—Yes.

592. It was instituted for the purpose of providing higher technical and scientific instruction for the enormous population of Tyneside really?—Yes, it was founded in 1871 jointly by the University of Durham and the North of England Institute of Mining and Mechanical Engineers.

593. Do you know the number of students at present?—The number of day-students is over 500.

594. There are various departments, mining and metallurgy, marine engineering, naval architecture, electrical engineering, and so on?—Yes, naval architecture is a new department. There is our department

of chemistry also, which is a very strong one, as well as other departments in pure science, arts, &c.

595. The agricultural department is merely a department of that college which gives special instruction in agricultural subjects?—That is so.

596. It gives the students in the agricultural department the advantage of getting the teaching from teachers in the other departments, such as chemistry and pure science?—Yes. By the Agricultural Committee co-operating with the college they have practically saved the cost of providing instruction in pure science, because that is already provided for in Armstrong College, which is practically a university college.

597. The funds of the department are kept distinct?—Yes.

598. They are under the supervision and control of the committee?—Of the Agricultural Committee of the college.

599. Which practically manages them by means of a sub-committee?—Yes.

600. The sub-committee go very closely into all the details of the finances?—They examine into every item of expenditure.

601. And the accounts are submitted to and examined also by the Board of Agriculture?—Yes.

602. And also, I think by the college accountant?—Yes, they are audited along with the college accounts.

603. So that there would not be any opportunities of unduly increasing salaries even if it were attempted; it would soon be found out?—Yes, and there are several other checks.

604. To prove that this department of the college is meeting with the approval of the public in addition to the action of the Surveyors' Institution, to which you have already alluded, is it not the fact that some endowments have recently been left to it?—A large endowment has recently been left, the Daglish Bequest, to the college, from part of which, when it comes into operation, the agricultural department will derive some benefit.

605. Have you any opinion with regard to the Consultative Committee which has been suggested? Do you think that would be a useful institution?—I think the Consultative Committee for agricultural education generally would be exceedingly useful.

606. Do you think that representatives from so far off as Newcastle would be able to attend very regularly?—It would be unfortunate, I think, if the meetings were held frequently, but if the meetings were held once a year I do not see why they should not attend. I do not think it would be desirable to have meetings more frequently than once a year.

607. Is it not a fact that co-operation in all the Durham mining villages is very common. There are a great number of co-operative societies, are there not?—That is so, and in connection with the Agricultural Co-operative Society an association has been formed in the middle of Northumberland which I believe is becoming quite useful. In connection with co-operation there is a very strong body of farmers in the Darlington district, called the Tenant Farmers' Protection Association, which, although not strictly a co-operative society, has done very great service to farmers by helping its members when they get into any business difficulties, and that association has proved a most valuable thing for the farmers, and I may say also we have found it a most valuable agency in connection with education.

608. I was going to ask you what effect co-operative societies have had on education?—This association has had a most important effect. Among the best audiences we have had, have been meetings of this association, and some of the largest parties that have come to Cockle Park have been organised by the same association.

609. On the other hand, the ordinary miners' co-operative societies have not had any effect whatever—they have taken no action?—I am not aware of it.

610. They probably buy very largely foreign produce too?—Very likely.

611. I do not think I need ask you any questions about the forestry department because that is very fully explained in your book. I may just ask you this:

It is a fact, is it not, that the forestry sub-department, I may call it, have got a very large area of wood under its control?—We have now got under the control of the forestry section of the department, not only the forestry plantations at Cockle Park in Northumberland, but we have an area of about 900 acres, the Chopwell Woods, which His Majesty's Office of Woods has placed under the management of the College, and which we have got for demonstration purposes. That will prove very valuable indeed. In addition we have several demonstration plots, and the principal land owners in the North of England have also opened their woods to us for demonstration purposes in connection with the Forestry Department.

612. Has it been your habit to go about a great deal, and also in the character of a lecturer to meetings of farmers' clubs and chambers of agriculture, and so on?—Yes, I have attended a great many of those meetings.

613. Do you find that your visits are appreciated?—Yes, I believe so.

614. You publish bulletins?—Yes, and we take copies of them with us to distribute at such meetings.

615. Have you any of those here?—Yes.

616. Could you give the Committee one as a specimen?—That is one. (*Handing book.*)

617. How many do you publish of these in a year?—We published about eight bulletins of this character last year. That bulletin I am passing round is a bulletin giving the result of our rotation experiments at several centres in the North of England, and giving a description of the soils also at those centres. We have also a report here, another bulletin, on the manuring of root crops and potatoes in the county of Durham during last season; and there is a bulletin here for which there has been a considerable demand—the report on the Tree Field experiments at Cockle Park for nine years, dealing with the pasture experiments there.

618. You have also published a bulletin on feeding experiments with sheep, and on finger-and-toe disease, have not you?—Yes. The bulletin we published on the feeding of cattle and sheep with Bombay cake has greatly increased the sale of that cake in the North of England, and has given a knowledge of that cake to farmers that they otherwise would not have got. It is a new food, and a knowledge as to its feeding value was very much wanted.

619. You think these bulletins are appreciated?—I am sure they are.

620. You have applications for them and questions addressed to you with regard to them?—Yes. And in giving information these bulletins are of the greatest assistance to us, because it often saves having to put a long account in a letter, because we can simply refer to a result in the bulletin.

621. They cost a good deal for printing, I suppose?—Yes, they do cost a good deal for printing.

622. While I am on the subject of finance again, the College assist the department a good deal indirectly, do not they?—Yes, indirectly. No charge is made for heating or lighting the agricultural rooms, or for general expenses like the porter, and we have all the advantages of the Principal and of the Secretary of the College without paying for them.

623. So that the Agricultural Department is a department of the College, and the College practically does not interfere with it. It is a fact, is it not, that the Council of the College retain and are responsible for supreme control?—The Council of the College can amend or reject any resolution of the Agricultural Committee, but I believe they have never done so.

624. They appoint all the staff, but on the recommendation of the Committee?—Yes.

625. Only one more point about the North Eastern Counties School at Barnard Castle. You have mentioned the fact that there is an agricultural side to that school. Are you aware that it is a question whether that can be continued—that that matter has been for some time under consideration?—I am aware that the agricultural side of that school was, and I believe is, in a very precarious condition. I should be very sorry indeed, for the sake of agricultural education in the North of England, if that side were allowed to go down. I feel it would be a loss to the district.

626. (*By Lord Belper.*) I do not think I need ask you

Prof. D. A. Gilchrist.
1 May, 1907.

Prof. D. A.
Gilchrist.

1 May, 1907.

anything about your College, because the questions which Lord Barnard has asked have fully explained what your position is with regard to the Department of Agriculture. I should only like to ask one question about your Forestry Department. Has that been established long?—The Forestry Department was really founded in 1892 when Dr. Somerville was appointed not only as Professor of Agriculture but as Professor of Agriculture and Forestry. Dr. Somerville gave lectures in Forestry, and established the forestry plantations at Cockle Park as well as other work. That was greatly developed three years ago when we were able to do so by the addition of the Board's grant of £250, when we appointed a lecturer specially for this work.

627. That is three years ago?—That is three years ago.

628. I see from this book that out of a total expenditure on the Forestry Department of £319 the Board of Agriculture made a grant of £250?—Yes.

629. £58 was met by subscriptions and fees for advice?—Yes, and fees of Forestry students.

630. The students' fees apparently are £13. That is not a large sum?—No, but the fees for other than pure forestry classes go to other Departments.

631. Practically the whole of your expenses are met in that way. £58 in subscriptions, £250 from the Board of Agriculture, and these students' fees?—Yes, and we keep the Forestry account distinct.

632. Was that grant given to you because those woods were handed over to you?—No. The use of the woods was obtained because the lecturer whom we appointed approached the Office of Woods—or rather, we approached the Board of Agriculture and the Office of Woods—and it was after negotiations with the Office of Woods that the management of Chopwell Woods was vested in the college.

633. Therefore your enterprise took place after you got the grant really?—At the same time we had an elaborate Forestry scheme prepared, and the offer of extensive facilities when we applied for the grant. We certainly have got some excellent woods for demonstration—woods on Tyneside, and there has always been a great interest in Forestry on Tyneside.

634. Is Forestry made a subject for any of your diplomas or degrees?—Yes, both for the degrees and in the diplomas.

635. Is it a compulsory subject, or can it be taken up as an alternative for other subjects?—For the degree it is a compulsory subject, but for the diploma it is an optional one.

636. I see you have started some lecturing, but only in one centre, and only three lectures have been given. I am talking of the paragraph in your report which says: "In Forestry a course of three lectures was given at one centre to an average audience of twenty." Is that the extent of your lecturing in Forestry?—Might I know the year of that.

637. This is the Annual Report for 1905-6. That is the extension work. It is on page 18?—In Northumberland courses of six lectures in Forestry were given at one centre, of four at another, and of three at one other centre; so that there were courses of Forestry in three centres in Northumberland. In Durham a course of three lectures was given at one centre. There were none in Cumberland or Westmorland.

638. Yes, I was wrong. There were courses at two centres, one in Northumberland and one in Durham?—Courses at three centres in Northumberland and at one in Durham; that is four centres altogether.

639. (By Mr. Lamont.) You said in answer to Lord Barnard that there were in the County of Durham several co-operative societies?—There are several mining co-operative societies.

640. Are there any co-operative societies of small farmers?—I do not think so in the ordinary sense of co-operative societies, but there is this body that I referred to, the Tenant Farmers' Protection Association, which is practically a co-operative society, although not in the usual sense; it is not a co-operative society for buying.

641. (By Lord Barnard.) There is a newly-formed one called the Middleton-in-Teesdale Co-operative Society?—Yes, I am sorry I forgot to mention that.

642. (By Mr. Lamont.) I wanted to get whether those

societies exist for the purpose of purchase or for the sale of produce or for both?—Primarily the object of the Society just mentioned is to assist the farmer both in buying and selling. I should say that the North of England farmer is not taking very kindly to co-operation on the whole.

643. (By Lord Moreton.) I do not quite understand about the degree. Is it a degree of the University of Durham?—Yes, it is a degree of the University of Durham.

644. We have heard a great deal from you and from the last witness about the pupils. Can you give us any idea as to what it would cost a farmer's son to come up and go in first of all for the degree?—For the degree course the tuition fees amount to £20 a year, and if you take the whole cost, including the cost of living in Newcastle it could be comfortably done for £60 a session. That is £180 for the three years.

645. Now, will you give us the same with regard to the diploma course?—With regard to the diploma course the tuition fees are £10, and as the students come up for two terms only (or the winter) the cost is considerably less; it can be done, with economy, for about £30 for each winter.

646. As regards the diploma course, I suppose you have students slightly older by a few years than would come up for the other course; in other words, probably they would be youths who had left school for some little time?—We prefer for both courses that they should have left school for a year or two, because we find although they do not do so well in the pure science side they do much better in the agricultural sides.

647. Do you find when they come up like that that a certain amount of time is wasted through their having forgotten their mathematics a good deal?—They certainly have forgotten their mathematics, but on the other hand I do not think the time is wasted, because if you give lectures in agriculture to boys who have just left school they do not take the same interest or get the same amount of benefit from them as young men who have had two or three years on the farm before coming to take that technical course do.

648. With regard to the instruction in veterinary science that your pupils get, is that satisfactory, or if you had more money would you increase the teaching?—We certainly should, and with regard to dairying it is very desirable that that should be increased, especially in the North of England. In the past, education in dairying has practically meant education in butter and cheese making, but in the whole of our district very little butter and very little cheese is made, and now with this inquiry into tuberculosis and the difficulty the farmers have got owing to the milk standard it is of importance that efficient education should be given to the young dairy farmers, because the dairy farmers' business is becoming a very complicated one and very harassing. It is, therefore, exceedingly desirable that suitable education should be provided for the young dairy farmer, and for that we are not as fully equipped as we should be.

649. (By Mr. Staveley-Hill.) You have been asked about these short courses. They are in the return here. The number seems to remain normally at about 30, whereas some years ago, in 1900, it was 59. Is there any reason why there should be such a drop in seven years; it has gradually gone down?—I think probably two dairy courses have been given in the year instead of one.

650. That may explain it, otherwise it is rather a remarkable drop from 59 down to 34?—It is.

651. What would two dairy courses mean? I see the figures in front of me refer to "farmers' sons and dairy short courses." That is the heading of it, and I come to the figure 59 in the year 1900, and it drops down to 34 in the year 1906.

652. (Mr. Middleton.) I can explain that point from memory. It must have been due to the dairy course; the number of farmers' sons was about the same in each year, but the dairy courses were arranged sometimes in winter and sometimes in summer, according to convenience, and that accounts for it. Of course, I have no particulars before me. I am only speaking from memory.—I think that is the explanation. Practically every year Northumberland gives 10 exhibitions and Durham 10 exhibitions for the short course for farmers' sons, and we have usually one or two who pay their own expenses. That gives us annually from 20 to

22 taking the six weeks' farmers' course. I put a point of interrogation for this year to the number taking the dairy course, because the classes only commenced this week, but we usually have 12 from County Durham for dairy courses each year.

653. (*By Mr. Staveley-Hill.*) Four counties are connected with this College, are they not?—Yes.

654. Is there a general Council of those four counties to manage the College?—The Agricultural Committee consists of representatives of those four counties and of direct representatives of the College—that is the Committee which has the management of the Agricultural Department.

655. That is a joint county Agricultural Committee.—No; it is a College Committee, but the County Councils appoint representatives on the College Committee.

656. Could that be extended by a County Committee of all four counties? Do you think there is any better way by which those counties could be represented?—This Committee is working in an exceedingly satisfactory way. So long as the representation is all right, and especially as there is such a close connection with the College, I think, so long as the counties are efficiently represented on the College Committee, that the arrangement is a very satisfactory one.

657. The buildings of your College are all now complete, are they not?—We thought so till a year ago, but there may soon be a further extension for Naval Architecture and other purposes. We have now completed the new wing.

658. If you had any extra grant some of it would have to be devoted to building, and not all to the scientific or to the teaching part.—Hitherto all the agricultural grants have been devoted to agricultural research or to teaching.

659. Not to buildings?—Not to buildings.

660. You have visited the Canadian Colleges of a similar character, have you not?—Yes.

661. Have you visited the New York Department?—No.

662. What is the system of grant in the Canadian Colleges—the one at Montreal, for instance, that you mentioned?—The one at Montreal is a school, and is founded largely by a private endowment by a Mr. Macdonald, but taking first of all the Canadian Government farms, the central farm at Ottawa, of which Dr. Saunders is the Director, and the farms for all the provinces, are subsidised directly by the Government. Among the Colleges the Ontario Agricultural College at Guelph is subsidised by the Province of Ontario.

663. (*By Mr. Middleton.*) First of all you told us that you required buildings at Newcastle, but I think you explained later that what you require is a dairy building only; you have suitable accommodation provided for the College?—Yes, that is so, but we are very much in want of dairy accommodation at the present time.

664. To the list of students that you have given us could you conveniently add the number of entries—the number of students who have joined the Institution each year? That statement you could perhaps send to us. Our object is to get a comparative statement, and it is a little difficult if we do not know the number of entries?—Yes.

[*The Witness subsequently wrote that the number of agricultural students entering Armstrong College each year as new students for long courses of study were: 1891-2, 4; 1892-3, 4; 1893-4, 12; 1894-5, 15; 1895-6, 7; 1897-8, 9; 1898-9, 15; 1899-1900, 4; 1900-1, 2; 1902-3, 14; 1903-4, 12; 1904-5, 14; 1905-6, 18; 1906-7, 14.*]

665. Have you formed any opinion of the character of the short-course students coming from the counties of Northumberland and Durham; which group of students do you expect to do best?—There is very little difference between them.

666. You find them very similar?—Yes, on the whole they are very similar. These come mostly from the smaller farms.

667. As regards the long courses, do your students now come chiefly from Durham or from Northumberland?—There are considerably more from Durham than from Northumberland, and I think that is very largely due to the larger number of extension lectures that have been given in Durham. Of course, Durham is a better recruiting ground as there is a large number of farmers,

but no doubt it is the lectures that have had that effect.

668. Have you found that the agricultural population of Durham are more easy to teach, by way of lectures, than the agricultural population of Northumberland—I do not know whether you would like to say so?—I must say that in both counties I have had great pleasure in lecturing, and I have been listened to with the greatest of interest by the farmers.

669. Do you think that the presence of the industrial population, side by side with the agricultural population in Durham, has had something to do with the way in which the Durham farmer comes to lectures and listens to lectures?—I do not think so. I think our meetings have been as good in the more strictly rural districts as in the populous centres.

670. With regard to the North Eastern Counties School at Barnard Castle, that school is, I believe, largely taken advantage of by farmers' sons?—That is so.

671. Chiefly farmers' sons?—Yes.

Lord Barnard: I would not go so far as to say "chiefly." There are a great many farmers' sons.

672. (*By Mr. Middleton.*) The agricultural side has not been a successful side, has it?—At present there are ten boys on the agricultural side, and that is a very small proportion of the total number of boys in the school. A considerable proportion of farmers' sons go there not for the agricultural side at all, but for the other sides.

673. (*By Mr. Latham.*) Taking the last question first, is there any reason why the farmers' sons do not join the agricultural side?—I think it has been largely because on the whole the farmer is very conservative, and he has already found schools to send his sons to in many cases. I am thinking of the Northumberland farmer now. He sends his boys to schools in other counties altogether; he has got into the habit of doing so, and it has become a family arrangement, and it does take time to alter their habits.

674. You made a remark just now that a large number of farmers' sons went there, but not for the agricultural side, and I ask you, is there any reason why the farmers' sons do not join the agricultural side?—Of course there is one very important reason for that, and that is that a large number of farmers' sons are not going in for farming at all.

675. Is that the answer why the secondary schools cannot support the agricultural side, because the farmers' sons now-a-days are not going into farming?—No; if all the boys who are intended for farmers in Northumberland and Durham did go to the agricultural side of Barnard Castle School there would be a considerable number.

676. What is the reason that they do not go there?—I can only say that I think the parents have got into the habit of sending them to other schools.

677. Other schools without agricultural sides?—Without agricultural sides.

678. And although they do not join the agricultural sides they come to you afterwards?—Some of them do.

679. Is not their agricultural education very much lessened in consequence?—Of course, I may say that that is not very important in the case of those who come to us for the agricultural side, because they get the agricultural training when they come to us, and if they are going in for the degree what we want is a good secondary training. But a school with an agricultural side is especially wanted for the farmer's son who is going to finish his education at a secondary school.

680. And not coming on to you?—And not coming on to us.

681. Then it is a very serious loss that they do not join the agricultural side?—Yes, if they are not going further than the secondary school.

682. You spoke of having applications for advice; could you tell us the character of those applications?—The character of the applications for advice, to take the letters I have had just lately—the last one I had just before coming here enquired "How to apply the tuberculin test," and there have been a good many letters as to the feeding of dairy cows and live stock generally. Lately, during the Spring, there have been a considerable number of enquiries as to the manuring of different crops and of hay and pasture.

683. Have you had any enquires under the Fertilisers Act?—In connection with that, as a college, we do

Prof. D. A. Gilchrist.

1 May, 1907.

Prof. D. A. Gilchrist.

1 May, 1907.

not analyse under the Fertilisers and Feeding Stuffs Act, because there is a feeling in the College that a college that is subsidised should not undertake analyses for commercial purposes, but we have a considerable number of enquiries; farmers send to us copies of invoices and copies of quotations that they receive for manures, and ask for an opinion as to the quality of those manures.

684. You spoke of your records as being very valuable, and you told us that you published them?—Yes.

685. Are they to be had free or at small cost?—They are to be had free by residents in the four northern counties through the County Councils.

686. There is a general desire for small holdings, and you have been talking about the working farmers. Have they any opportunity of getting benefit from your College?—In the County of Durham a considerable number of those who attend the extension lectures are small holders.

687. Are the lectures free?—They are practically free; in some cases a charge of 1d. or 2d. is made.

688. You made a remark just now that I was very much surprised to hear you make about farm servants. You said that in the south they were only engaged for the summer months; I think that is practically wrong?—You know more about Oxfordshire than I do, but I believe it is true, but on the whole all the farm labourers are engaged throughout the year in the north of England, whereas a considerable number are engaged only for a certain time of the year in the south, speaking generally.

689. I do not think that is so, and I was rather surprised also to hear Lord Barnard make the remark he did with regard to that, because our servants in the south are engaged quite as much at a yearly wage as they are in the north, I think. With regard to the appointment of a Consultative Committee, and to your remark that the men in the north would not probably attend very regularly, I suppose you are aware that the attendance of members from the north at the Central Chamber of Agriculture are much more regular than they are in the south?—I feel there would be a good attendance so long as the meetings were not held too frequently; and I do know, as you have mentioned, that the northern members, who are representatives of the Central Chamber of Agriculture and of the London Farmers' Club, are very regular attenders.

690. I should like you to give us a little further information as to how much further you would go with dairy education if you had the chance?—In answering your question I might say you know of my old connection with Reading, and there is an excellent institution there, the British Dairy Institute; but at Armstrong College there is nothing of that kind. There is practically no provision for development in Northumberland, and I should like to see, not a national institution like that at Reading, which is not what we want, but some central provision for dairy instruction and for dairy research.

691. But very much on the Reading lines?—Yes; and as we produce such a large amount of milk the work should be more on the lines of milk production as well as on cheese and butter.

692. Do not you think, going back to the lectures, that the audiences are not so much to blame very often as the lecturers. I have attended a great many of them in the south, and I think they are very often too far advanced for their audience?—I think probably you are thinking of an instance in the South of England, where a lecturer who had given a lecture, had referred to a certain animal as a "Shorthorn" when it was nothing of the kind. When I commenced work at Reading in 1894, I found this and some similar instances had given a bad impression of agricultural lecturers. There have been difficulties of that kind, no doubt, but in the beginning of the work in some cases the wrong type of man was engaged, but in my experience in lecturing to farmers since 1889 I have never had any difficulty, except perhaps at the first meetings, so far as prejudice is concerned, and I have no hesitation in saying that the prejudices of the British farmer are very much over-estimated, that he is a very sensible man at bottom, and it is astonishing, bearing in mind what he has been considered by some to be in this country, how well he gets on the moment he goes to the Colonies.

693. We have had lectures in Berkshire to farmers,

which have been very well attended indeed. Mr. Percival, the lecturer, is a very popular man, and if a lecture is not a success it is not the audience that is to blame, but the lecturer?—That is likely to be so.

694. (*By Dr. Somerville.*) Referring to your desire to see a great central dairy school in the North of England, you have always referred to that in connection with the counties of Durham and Northumberland only; do you deliberately exclude Cumberland and Westmorland?—I should have explained that at present there is the Newton Rigg Farm School for Cumberland and Westmorland, where very efficient and excellent dairy instruction is given. That is the school for those counties, but we have no provision of the kind for the counties of Northumberland and Durham.

695. So that in your opinion the Newton Rigg School supplies the requirements of Cumberland and Westmorland?—Yes, I think so, and very usefully too.

696. Would it not be possible to utilise that school for the requirements of the pupils in Northumberland and Durham?—To a certain extent it would, but the dairying carried on in Cumberland and Westmorland is very largely butter-making and cheese-making. That is the work for which the Newton Rigg School is equipped, whereas in Northumberland and Durham the dairying is very largely milk production, and the work that is really needed includes bacteriology and the general production of milk, and therefore work of a special character.

697. I think you said that in the future you would like to strengthen the instruction in dairying, estate management and veterinary science at your College?—Yes.

698. Have you, at the present time, an instructor in veterinary science in your department?—No, we have an instructor in agricultural zoology, who does do a certain amount of veterinary science, but he has not had a special training in veterinary science.

699. You would like a duly qualified veterinary practitioner to be attached?—Yes, to give part of his time.

700. Have you had any difficulty in the way of opposition from veterinary practitioners to the giving of veterinary instruction to farmers?—We have had some difficulty in that respect, but, at Bangor, we overcame that difficulty in a very satisfactory way, and at Reading also. At both those places it is done in a most satisfactory way.

701. Have you heard that the veterinary profession generally rather set their face against instructing young farmers in the mysteries of their profession?—Yes.

702. Do you know, in fact, that you have had to appoint in the North of England a qualified zoologist to give instruction in veterinary science, because, hitherto, members of the veterinary profession, who had been willing to give instruction, have had pressure brought to bear upon them to induce them to desist from doing so?—I think I may say that whereas pressure at one time was against it, that pressure is not now so strong. Mr. Clement Stevenson, who is one of our best known veterinary surgeons in the North of England, and a member of the College Agricultural Committee, supports the veterinary qualification for this purpose.

703. I am very glad to hear that. You have already told us a good deal about the arrangements as regards the degrees and diplomas, but I should just like to hark back to those for one moment. I should like to know whether any practical qualification is demanded either from candidates for the diploma or for the degree?—Formally no qualification of that kind is demanded, but in the way in which the practical examination for the degree is carried out now, which is held at Cockle Park, they could not get through unless they had some practical knowledge of agriculture.

704. So that the examination is partly conducted on the land?—Yes.

705. But no requirements, as regards residence on a farm, are demanded?—No.

706. You do not think that is desirable, do you?—Yes, personally, I am of the opinion that that is desirable.

707. Do you know that it is the case, for example in Edinburgh that a man cannot go in for an agriculture degree unless he has resided for 12 months on a farm?—Yes.

708. If that could be managed would you like to see that in your case?—Yes, I should like to see that.

709. You have already told us that the degree is the

higher qualification in the North of England. We had evidence from Cambridge yesterday to the effect that the degree was a lower qualification than the diploma?—I think there is this difference in Armstrong College, that the degree course is wholly framed for agriculturists; it is not simply taking agriculture as an optional subject. The degree course is framed throughout with the object of giving a complete scientific and agricultural training.

710. Could a man get a certificate in agriculture at the end of, we will say, the intermediate stage in his diploma examination?—No.

711. Have you ever in the North of England found that men who had taken their degree in pure science were induced to remain on for another year to specialise in agriculture and take their diploma?—We have not had a case of that kind, at any rate, for four years.

712. We had evidence yesterday that at Cambridge a great many young men embark on pure science, and when they get their degree in pure science they realise that they have not secured a profession, and that they then proceed to study agriculture and take a diploma. You do not find in the North of England that the young men embark on education without knowing what the end of it is going to be?—I think the great bulk of our students in the Armstrong College have an object when they start, and most of them stick to it.

713. They are in fact more practical from the beginning than in some of the other institutions in England?—I think that is so.

714. I suppose these bulletins and returns that you issue have a distinct local bearing?—Yes; they have all got a distinct local bearing.

715. You do not, I suppose, attempt to dispense with the leaflets that are issued by the Board of Agriculture now?—No; on the contrary; I think we do make the fullest use of the Board of Agriculture leaflets.

716. You know they issue about 200 leaflets?—Yes.

717. Are you able to utilise them in your courses of instruction?—The Board of Agriculture leaflets in the past few years have been invaluable to us in teaching; they have been of the greatest service in connection with our classes in agriculture, and if we go to give an address to farmers and there is a leaflet published on that subject we can take copies of the leaflet and distribute it amongst them at the meeting, explain what the leaflet means, and then each farmer has something definite to carry away with him. It may be if we give an address on our own experiments that we take our own bulletins and distribute them in the same way. I may say in connection with this that we have a very strong Agricultural Students' Association formed of past students, and we arrange that those leaflets as issued are sent to each member of that association, and these are greatly appreciated by the members.

718. You mentioned that the salary of the horticulturist, £110 a year, was all found by Cumberland and Westmorland?—Yes.

719. Does Northumberland take no part in the horticultural work of the College?—I should explain in this connection that up to three years ago the county of Northumberland paid half the stipend and took half the time of our College instructor in horticulture, and Cumberland the other half. But a re-arrangement was made and Cumberland took two-thirds of the time of the College instructor in horticulture and Westmorland one third, and the arrangement now with Northumberland is that Northumberland engages their own instructor. He is doing excellent work. He lives at Cockle Park. The Committee give him a house to live in, and he supervises the experimental garden at Cockle Park. In that way he works directly for the Station, but otherwise he is engaged by the County Council.

720. So that you have now two instructors, one confined to Northumberland and the other to Cumberland and Westmorland, and that Durham makes no demand?—We have applications for lectures from Durham, but we have no one whom we can send to give those lectures—but there is a demand for them at the present time.

721. I suppose a very large part of the benefit that your Agricultural Department confers in the North of England lies along the line of the research and demonstrations that it conducts?—Probably the most important part of our work is research.

722. If that is the most important part of your work, or nearly so, do you not think that as regards future development you would include research along with dairying, estate management and veterinary science?—Yes, I certainly should; I intended to include that.

723. Do you think public funds could be utilized to a larger extent in the North of England for the prosecution of agricultural research than has been the case in the past?—When I stated as my opinion that no centre for agricultural education was complete until the staff were in complete touch with the agriculturists in the counties connected with it, I did mean that that should only be by original research in connection with soils and crops, and all that kind of thing, and that that work was capable of great development. I meant that as the most important direction in which we could develop.

724. (By Lord Barnard.) I want to make one comment on the question of the connection between Cumberland and Westmorland and the neighbouring counties. It must not be overlooked that there is a comparatively high range—I will not call them mountains—that runs north and south. There are only two lines of communication, one of which is frequently blocked in winter with snow, and the consequence is that the inter-communication between the two eastern and two western counties is very, very difficult indeed. Inter-communication east and west is very difficult. That accounts, I think, to some extent for the fact that Cumberland and Westmorland have their dairy instruction separately?—No doubt.

725. (By Mr. Medd.) Do the local councils consult your committee as to the general scheme of education in each county or only as to the general work in which you assist them?—We have now—we have only had it for a year—an agricultural sub-committee for the county of Durham, on which the College is represented, and the Cockle Park Management Committee is practically the agricultural sub-committee for the Northumberland County Council; on which also the College is represented.

726. The other two counties have no agricultural sub-committees, have they?—Yes. The other two counties, Cumberland and Westmorland, have the farm management committee of Newton Rigg.

727. They do not consult your College committee with reference to any general scheme for the whole of the area—they work independently?—Cumberland and Westmorland work independently.

728. You do propose to establish a joint agricultural committee, do you not?—I should say while the committees work independently the fact of our having representatives of all four counties on our College agricultural committee gives an opportunity for discussing any work in the four counties.

729. It rather enables you to ascertain what is being done, but it does not give you any power to systematise it, and one wants systematisation of individual effort, and that can only be done by a joint committee?—That is so.

730. With regard to this secondary school question, I take it that for the students coming to you what you consider the best material is the product of a first-rate secondary school without any specialisation up to the age of 17 or 18—a *bona fide* secondary education?—No, I should not say that, because we have some students now, who have come from Dauntsey, who are really as good students as any that we have had. There is a risk that, if there is specialisation, the main character of the education is not so good, but, so long as that is looked after, they are all the better for having a certain amount of specialisation as long as that is not carried too far.

731. Of course, the Dauntsey School is exceptional, as you know; there is no school corresponding to it exactly, is there?—No. At Reading we got some very good students from the Burford Grammar School, from the agricultural side, and I believe that that side is now working very well indeed.

732. In reference to Barnard Castle, you said that the attitude of the farmers towards the agricultural side is not very favourable, or at least that it is indifferent?—I should say it is indifferent rather than unfavourable.

Prof. D. A.
Gilchrist.
1 May, 1907.

Prof. D. A.
Güchris.

1 May, 1907.

733. I suppose you are familiar with the curriculum there?—Yes.

734. Is there any subject included in that curriculum which is not appropriate to general education? I know of none. I put it rather in this way, that all this so-called agricultural side teaching is merely the study of natural and physical phenomena, which is just as appropriate to a man who is going to be a barrister as to a man who is going to be a farmer, for educative purposes?—At Barnard Castle there is a considerable amount of direct agricultural instruction given. There are a few acres of land and there are some plots with the different crops grown—small rotation experiments are carried out—and there are some pasture plots adjoining the school, while a certain amount of milk testing goes on, all of which could not be looked upon as otherwise than the agricultural side.

735. No, not the milk testing, but the experiments with regard to plants is all part of ordinary education apart from any specific reference to agriculture?—No, that is not what would be wanted in a secondary school.

736. No; but my feeling is rather this, that the term "agricultural" is misleading when used in connection with those schools, and it is on account of the use of that term that farmers fight shy of them. They have no objection to the instruction *per se*, but they do not believe that the art of farming can be taught at a school, and when a school holds out that they do teach agriculture they fight shy of it?—I believe they do not profess to teach agriculture; it is more like agricultural chemistry.

737. Quite so; but do you not think that that feeling on the part of farmers might be modified if they simply held themselves out to teach, say, rural science without the introduction of the word "agricultural"?—I think there is the same objection to the word rural as there is to the word agriculture.

738. But do you agree that the instruction might be given without the use of any distinctive term?—Yes.

739. With regard to the other forms of teaching for young farmers, you require something of a more distinctive character—I mean to say for those who cannot prolong their education beyond the age of 16 or 17—they want a definite intermediate agricultural school rather than a secondary school with an agricultural side, something in the nature of the *écoles pratiques d'agriculture*. Have you seen any *écoles pratiques d'agriculture*?—I have gone over the school at Grignon.

740. That is a national and advanced college?—Yes.

741. Have you gone over the *écoles primaires supérieures*?—No.

742. You would extend the winter course from 6 to 20 weeks, and you think that would be practicable?—Yes.

743. That would be in the nature of a permanent winter school?—Yes.

744. Do any of your students enter for the National Diploma in Agriculture?—Very few, and the difficulty about entering for that diploma is that that examination is held just at the most important part of our teaching session, and the fact of our students' time being taken up in cramming for that examination for a few weeks beforehand, and being away, I find it not only breaks the sequence of lectures and laboratory work, but that the students cannot continue their work in the same way, and that when later on they take our own examinations they are stale and do badly.

745. In fact, your own diploma and degree are equally valuable, you say?—I think so; the degree certainly more so.

746. Can you give any reason for the superior efficiency of the northern labourer as compared with the southern; is it due to climatic reasons, or environment, or education?—As the question was put by Mr. Middleton I think there may be something to be said for the other industries being side by side with agriculture, although I believe a good deal is also due to climatic conditions. Personally, I know I can do much more work at Newcastle than I could at Reading.

747. Do you know of cases where northern labour has been imported down here and paid at local rates, and has deteriorated very much?—No; I do not know of any such case.

748. You are familiar with the memorandum of the Board of Agriculture as to agricultural research, and without committing yourself to the terms of that memorandum, do you think that a central committee in London, to collate local experiments and distribute information and enable those concerned in local work to meet and discuss that information, would be of value?—For the purposes you have mentioned, I think it would be of great value, but as to controlling the character of the experiments I think that that would be a mistake.

749. With the limitation you suggest you approve of it?—Yes.

750. Of course you are appealing strongly for further financial aid. I must remind you that you get nearly one-eighth of the total sum contributed by the Board of Agriculture, so that I would appeal to you to do all you can to enable us to get those white places covered by some institutions as well as your own?—Yes.

Mr. M. J. R. DUNSTAN, M.A., F.R.S.E., F.I.C., called and examined.

Mr. M. J. R.
Dunstan.

751. (*By the Chairman.*) You are the Principal of the South Eastern Agricultural College at Wye?—Yes.

752. The College is an old monastic foundation which was purchased, in 1893, by the Kent and Surrey County Councils, and administered under a scheme of the Charity Commissioners?—Yes.

753. The governing body consists of 21 persons?—Yes.

754. Who are nominated by the various public bodies who elect them?—Yes, the Kent County Council appoint 9, the Surrey County Council appoint 6, the Hebdomadal Council of the University of Oxford appoint 1; the Council of the Senate of the University of Cambridge appoint 1; the Senate of the University of London appoint 1; the Council of the Royal Agricultural Society of England appoint 1; the Bath and West of England Society appoint 1; and there is one hereditary Governor, Lord Winchilsea.

755. The College was opened for students in 1895?—Yes, it was opened, for teaching purposes, in 1894-1895.

756. The cost of the purchase, total alterations, equipment and additions, amounted to nearly £21,000?—Yes; that was the first bill.

757. The College has since been enlarged, in 1900-1901, to accommodate 20 more students, at a cost of £11,396; how many students have you at this moment?—

We have, actually, 110 at the present minute, of whom 54 reside in College, the remainder residing out of College. Originally the accommodation was for 30 students; in 1900-1901 it was increased to 50, and in 1905 it was increased to 54.

758. Are these students farmers' sons?—A certain proportion of them are farmers' sons, the proportion varies. At present there is about 15 to 20 per cent. who are farmers' sons. By farmers' sons I mean strictly farmers' sons.

759. What are the remainder?—They are drawn from the professional and business classes, and we have a certain number of land agents' sons.

760. And, I suppose, some sons of land owners also?—Yes, I have not included those under the name "farmers."

761. The College was enlarged further in 1903-1904 at a cost of £1,700?—Yes, that was an addition of workshops, mainly, and new accommodation for servants.

762. Again, in the year 1905-1906, extensions and additions were made, costing £6,550?—Yes.

763. Therefore the total cost of the College, excluding the stock on the farm, has been over £40,000?—Yes.

764. And the total grants made by the counties for the equipment and maintenance since 1894 have amounted to £86,000?—Yes.

Mr. M. J. R.
Dunstan.
1 May, 1907.

765. The contributions of the Board of Agriculture amounting to £8,800?—Yes, and in addition to that there is a debt on the College now of about £14,000.

766. Which you are gradually paying off?—Which we are gradually paying off on a 30 years' repayment basis.

767. In the year 1905-1906, the county contributions amounted to £5,724, the grant from the Board of Agriculture being £1,000?—Yes.

768. The annual charge on the College income for repayment of loans and interest amounts to £800?—Yes; as perhaps you are aware we differ from other colleges in this respect. Other colleges have, of course, their buildings free, and we have to pay what is practically a rent of £800 for our buildings, and that will not be paid off for 30 years, and the increased cost with regard to the outside students who do not come from the counties is partially due to that fact, that we have practically to pay rent for the College.

769. Then we come to the courses of instruction, the degree course, the diploma course and the certificate course?—Yes.

770. Perhaps you will explain to the Committee those various courses?—The degree course is in connection with the London University, of which we are a constituent school, and the matriculated students of the University who join the College can proceed as internal students to the different examinations. After having been with us a year they pass what is known as the intermediate science examination, which is a pure science examination in chemistry, botany, zoology and some optional subject. Then after a further two years they pass their final examination in agriculture, agricultural chemistry, agricultural botany, with certain subsidiary subjects such as veterinary science, bacteriology, forestry, surveying, agricultural engineering, agricultural law, or agricultural entomology.

771. I suppose some of those are optional?—They have to be certified as having attended a proper course in two of those subjects, and that consists of 60 lectures; and they are also examined in the main subjects, agriculture, agricultural chemistry and botany.

772. They are internal students of the University?—They are.

773. Do you examine the external students?—No, that is done by the external examiners of the University, but we act with those external examiners in examining the internal students.

774. Of course the degree constitutes a higher standard than the diploma?—Very much higher. The diploma course consists of a three years' course. At the end of their first year they pass examinations in agriculture, chemistry and physics, botany, geology, zoology and veterinary science. At the end of their second year they pass in book-keeping, drawing and building construction, surveying and levelling, engineering, veterinary hygiene, entomology, and in the third year, agriculture, agricultural chemistry, botany and a general paper.

775. Is there an entrance examination for those who enter for the diplomas and degrees?—Yes, there is an entrance examination for those students with regard to whose education I do not feel quite satisfied. If a student comes to the College and says he has passed the Oxford and Cambridge Local, or the London Matriculation, I accept him, but assuming he has not satisfied that standard he has to pass the entrance examination.

776. The examinations are conducted by the staff of the College?—Yes, and the external examiners as well.

777. There are external examiners?—Yes. Professor Middleton has acted for us in agriculture, Mr. Wood in agricultural chemistry, Mr. Biffen in agricultural botany, Mr. Booker in surveying, building construction, etc., and for zoology, veterinary science, engineering, and so on, we have external examiners as well.

778. Then the certificate course, that is again a lower standard?—Yes; that is more of a practical course and is rather for the farmers' sons who can only spend a shorter time at the College. He goes straight away into a course of agricultural chemistry, and he also takes a course of agricultural botany. It is intended as a good practical working course.

779. Is that all through the winter?—It is all through the session from October to July.

780. How are the students divided amongst the

different courses?—In the degree course there are five students, in the diploma 52, and the certificate course takes the remainder, that is, 42.

781. The numbers are increasing steadily?—Yes, steadily.

782. Then you have special courses in addition?—Yes.

783. You have a practical farm course?—Yes. There the students reside on one of the farms and come down to the College for lectures on agriculture, veterinary science and book-keeping. That is two years as a rule. We do not recommend less than two years.

784. The surveyor's course is also two years?—Yes.

785. The horticultural course is a three years' course?—Yes.

786. Is Forestry included?—Yes; all students take forestry work and dairying and poultry keeping and all the subsidiary industries.

787. Does the farm belong to the College?—No; it is rented.

788. It is under your management?—Under my management entirely.

789. The fees for students in college for residents in Kent and Surrey are £60; for residents in the British Empire, £120; and for foreigners, £150. You only allow ten per cent. of the total number of students to be foreigners?—That is so.

790. Are there any foreigners at present in the college?—Yes, there are six. Two from the Philippines, one from Spain, one Greek, one Dutchman, and a South American.

791. You have given us the number of students from the year 1894 onwards?—Yes.

792. Is the accommodation for the students in the college satisfactory?—Each student has a separate bed-sitting room. The accommodation is quite satisfactory, only the building has not proved altogether satisfactory; we discover now that the partition walls between the rooms are too thin.

793. The farm buildings are in good condition?—Fair.

794. I see there are a few college houses?—Yes. Six students reside in college houses; those are houses that we either rent or have bought. The accommodation in the village is very unsatisfactory; of course it is a small village, and the houses are not very good in their accommodation.

795. Your students are drawn from all classes?—Yes.

796. About 15 per cent. of those now attending the college are of the farming class?—Yes.

797. Of the 109 students 97 are intended for farming or agency work, 73 and 24 respectively, and the remainder will probably take up occupations connected with agriculture?—That is so.

798. You have followed them after they have left the college?—Yes.

799. You state that a large percentage of sons of farmers of to-day are not intending to pursue farming?—It is my experience among a good many farmers that the sons are going into business or into some profession other than farming.

800. I suppose you have also, as you are the tenant of land comprising fruit plantations and orchards, included fruit growing as part of your curriculum?—Yes, there are 10 or 11 acres of fruit ground and orchards—there are 14½ acres altogether, 7 acres of which are vegetable ground, and 7½ acres of fruit ground. 5½ acres have been planted up as forestry plantations and 7 acres with hops. The total acreage of the farms is 460 acres.

801. I suppose the experiments on the farms are watched by the farmers in the neighbourhood?—Yes. Farmers' parties come over during the summer.

802. Does the staff of the college give any lectures in the county?—A good many. They give lectures in Kent and Surrey on such subjects as science for gardeners, fruit culture, veterinary science, poultry keeping, hop growing, dairy farming, poultry work, and so on.

803. Are those lectures well attended?—Where they are well organised locally they are well attended; but where they are badly organised they are very badly attended indeed.

804. By well organised locally do you mean properly

Mr M. J. R.
Dunstan.

1 May, 1907.

advertised?—Properly advertised, and my experience is that where there is a good farmers' club, or a good horticultural society, or something of that kind to act as a nucleus, we can usually get a good audience; but where a lecture is got up, say, by the parson, who may have had a lecture on cookery last year and wants to have a change, and thinks he will have a lecture on agriculture this year, the result is that no one is consulted who is interested, and there is a very poor attendance. I know of one case where nobody at all was consulted, and there was nobody at all at the lecture, not even the clergyman who organised it. There are a great many well organised farmers' clubs in Kent—the Canterbury, and the Maidstone, and the Tunbridge Wells Farmers' Clubs, and the various agricultural associations, and at lectures organised by them one gets an audience of from 60 to 150, and you can be pretty certain that all of the men who are listening to you are connected with farming.

805. With regard to the work of the college, in addition to the teaching of students do you also train teachers?—The teachers generally take the degree course—by teachers I mean not the elementary teachers, but the higher teachers.

806. Do you hold summer courses for schoolmasters?—Yes, a summer course consisting of a fortnight.

807. Are those courses well attended?—Yes.

808. Does the Board of Education encourage the holding of those courses?—Yes. The elementary teachers' course is one of the most satisfactory with which I have had to do.

809. Is that recognised by the County Council?—Yes. Of course it only lasts a fortnight.

810. Research work in agricultural science is recognised also?—Yes.

811. I see you have a travelling farriery school?—Yes, a smith goes round the county with all the necessary apparatus, and he settles at a centre for a period of, say, three to six months, and gets most of the smiths and their assistants to attend the classes, and generally he passes through the school between 40 and 50 men.

812. The farmers apply to you for advice with regard to fruit and hop growing?—Yes.

813. That involves a personal visit to the farm of the person who seeks the advice?—Not always, but in a great many cases it does. We always try to arrange that, but of course the exigencies of time and the staff being engaged in collegiate work makes it difficult for the men to get about as much as we should like.

814. You also carry on experiments or demonstrations of methods of spraying, either at selected centres in the counties or on the college farms. I see you say "College farms." Have you more than one farm, or does that mean other farms connected with you?—There are two farms that we rent; one is called the Coldharbour Farm and the other the Silks Farm.

815. Those are both under your direction and managed by your own men?—Yes.

816. I suppose the tendency is to increase these centres?—For experiments I do not think it is, because the expense is a serious factor in carrying on experiments, and I find that the experiments we carry on in the college farm are far more satisfactory as a rule than those carried on at a distance where we do not have the trial actually under our own eyes.

817. You do not favour the increasing of centres; you would prefer to keep it under your own direct control?—I would.

818. I see you have just instituted, and it is very interesting, correspondence courses for farmers who are unable to attend the college courses?—Yes.

819. Would you just explain the principle of that to the Committee?—The idea of that is to reach farmers and young farmers who are unable to leave their farms and attend the college courses. There is a correspondence course, we will say, on manuring, a correspondence course on feeding, and a correspondence course on poultry managing, and the farmer, or whoever joins the course, pays a small fee, and he is advised in his reading as to what books or pamphlets he ought to read, and every week he is sent a digest of what he should read, and questions are asked him. He returns the answers to those questions to us, and we correct them and send him back the revised answers. That has only just been

started, and I can say nothing at present about its prospects.

820. What is the number of your correspondents?—They do not begin until next session. We shall not begin probably before August.

821. You have reason to believe, however, that it will be largely availed of?—Yes, I have reason to believe so.

822. Summer courses for schoolmasters for instruction in nature study are held?—Yes.

823. You also carry on the analyses of manures and foodstuffs for farmers?—Yes, and also the analysis of milk.

824. The survey of the soils of Kent and Surrey?—Yes.

825. The study of meteorological conditions as affecting agriculture?—A branch has only just started in that. We are at present working on the prevention of frost in the spring by means of smudge fires, and that means taking a large number of meteorological records, and temperatures in the neighbourhood of water and on different slopes and so on; and it is our intention to work with the Meteorological Society in getting some scheme of correlating meteorological observations with the observations on the growing of crops, which is a very difficult subject.

826. The expenditure on the college has increased from £5,781 in 1895, to £12,811 in 1905-6?—Yes.

827. I suppose your revenue is from the Board of Agriculture and from grants of the County Council?—Yes.

828. Horticulture is also taken up by you?—Yes.

829. I see you say two members of the staff are solely employed for research purposes?—Yes; they do not do any teaching work at all; they are entirely engaged in research, Mr. Salmon who is engaged in the prosecution of fungi and similar diseases in the country, and Mr. Gimingham, who is engaged on the soil analyses.

830. Do you consider that your staff is adequate for the requirements of the college?—It is adequate in numbers, but I do not think it is adequately provided for in salaries. What we find is that when our men get really useful to us they are generally tempted away by the prospect of a berth somewhere in the Colonies, perhaps, and we lose the men just as they are getting most useful to us. I think in the future if we are to keep our men and keep up our standard of work, we must increase our salaries. We do not pay our men enough to induce them to make a permanent stay with us.

831. I suppose you think you ought to have a higher grant in order to make that possible, and in order that you may retain your staff?—We should certainly like one. I think it would be for the good of the country generally that the men were retained in the centres in which they were trained and in which they gained their experience, because a man, for example, who has been with us three or four years, and who has learnt thoroughly the local conditions of Kent and Surrey, is perhaps offered £100 a year more in the North of England, and he leaves us in consequence. But there he has to go through the same apprenticeship, and during the first two years he is practically learning himself. It would be very satisfactory if we could keep that man ourselves.

832. You attach importance to his experience of the locality?—Undoubtedly. As a rule when a man comes to us, for the first year he is studying and learning the local conditions, and then perhaps at the end of the second year he leaves and we have to start another man in his place *de novo*.

833. I suppose you impose upon your students an obligation to do practical work?—We impose upon them an obligation to do a certain amount of practical work, but we do not try to make them what I may call second-rate labourers. We always hold that what they should learn at the college is what they would not learn on an ordinary farm, and if they want to become expert ploughmen or hedgemen, or sheep shearers, they ought to go and learn that on a farm.

834. You encourage them to do that in the summer months?—Yes. We however insist on them knowing how to set a plough, and how to alter it for different styles of working, how to shear a sheep, how to put on a horseshoe, to harness a horse for chain or shaft work,

to mow a strip of grass or lucerne, how to milk, how to make butter and cheese, and the grafting and budding of a series of fruit trees. Having satisfied us on these points then we say, "If you want to become more expert the proper place for you to learn that is on a farm."

835. (*By Lord Barnard.*) You told the Chairman that this institution is managed under a scheme of the Charity Commissioners. Can you put a copy of that scheme in?—I have not a copy of it here, but I will send it to you.

836. How came the Charity Commissioners to make a scheme for this institution. Am I right in assuming that it has got an endowment?—There was an endowment, undoubtedly, but there is no endowment now.

837. What has become of it?—I do not know what has become of it.

838. To whom do you pay this £800 a year?—To the Prudential Insurance Company, from whom we borrowed the money.

839. I presume this is a charity allowance—it has been sunk in buildings or site, or something?—The conditions are these, that when the college first came to the County Council it was in a very bad state of repair, and to put it in proper repair would have cost a matter of £3,000. The local education authority could not afford to do that, and so an arrangement was made whereby they handed the buildings over to the County Council.

840-1. You mentioned the subject of meteorology—do you consider that is a subject of value in a course of agricultural instruction?—Perhaps of interest only, at present.

842. Do you think it could be made a ground for claiming additional support from the Government?—I do not know enough of the subject myself, I am afraid, to say. I think there are great possibilities in it, but I do not know for certain whether we shall get anything practical out of it. In this particular instance I referred to—smudge fires—and I think there is much to be learnt.

843. In your opinion, is it a subject that will be taken up elsewhere?—I do not think it will be.

844. The degree course is four years. Is that a regulation of your college?—Yes, it is a necessity. Matriculation is taken in the first year; then there is the intermediate, and in two years more the degree is taken.

845. You do not, of course, know the evidence that has been given from Newcastle and also the evidence that has been given here from Cambridge?—No.

846. You are the third head of an institution of this kind that has appeared before us, and as far as I can judge the requirements in each case are different. Do you think there would be any advantage if there were a uniform system of degree courses and diploma courses?—I think if the uniform system took account of a high standard it would be a good thing. We do not want to lower the standard of degrees in the country.

847. All the three colleges that have come before us have got three different systems?—That is a thing rather for the Universities than for the colleges. The Universities grant the degree.

848. With regard to the subject of research, do you consider research is of great value?—Of great value in itself, and of great value to a teacher too; I hold that every teacher should be an investigator.

849. I see you have stated that the research work necessitates the employment of two members of the staff solely for research purposes?—Yes.

850. The research work is one of the financial necessities of your college?—Certainly.

851. Do you publish the result of your research work?—Yes; it is published in this journal, which is our last journal.

852. Are those made available to farmers and others interested in agriculture in the two counties?—Yes; this journal is sent to any farmer in Kent and Surrey gratuitously who cares to apply for it, and it is forwarded on payment to outsiders.

853. As to analyses, you know of course the law on the subject under the Fertilisers Act?—Yes.

854. Do you think it is desirable that an institution such as yours should do this work rather than it should be done by the County Council analyst?—I would rather

not undertake the work, because I do not think the presence of a member of a college staff in a law court is advisable at all.

855. Some of your students, you have told us, are the sons of farmers, and a large proportion of them take up actual farming work?—Yes.

856. Do you consider that it is desirable that a college such as this should provide an education for others more or less indirectly connected with agriculture in addition to actual farmers, such as teachers and people engaged in other trades, for instance the milk trade, millers, maltsters, land agents, and so on?—I think so. I think the education of all the people engaged in the agricultural industry is a benefit to the industry.

857. And even that it is desirable that we should train men in England who should ultimately go to the colonies and abroad?—I certainly do not think it is desirable, but I think it is unavoidable.

858. A certain number of your students do go abroad?—I am afraid they do.

859. Probably the best of them?—Probably; I have sent six men to the Indian Agricultural Department recently. They get £300 a year out there, whereas at home they would only get £100.

860. You say you find that teachers, because you cannot pay them adequate salaries, leave you. Do you think that is very general?—I think it is; it certainly was the case before I came to Wye.

861. It is so in the case of others of those centres that we see displayed on that map there; it does not apply to yourself only.—That is so.

862. (*By Lord Belper.*) With regard to the question Lord Barnard asked you, whether it was desirable to educate the people who are not actually farmers' sons to go abroad or to the Colonies, is it not very essential that in a first-class agricultural college you should have a number of students coming who seek the very highest possible education in the particular subject that they come for, and that if you are to keep your college up to the standard up to which you wish to keep it, it is desirable to induce men to come there who will require the highest possible education?—Undoubtedly.

863. And qualify themselves as teachers and university men who will take a very high place after they leave your college?—Undoubtedly.

864. You cannot keep your college up to the standard unless you do that?—No.

865. Before you came to Wye you were connected with another institution of the same sort, the Midland Agricultural and Dairy College?—I was.

866. You have also had large experience of agriculture in the county of Nottingham; you had a very large experience amongst the farmers there, and you have also been co-opted as agricultural member or the Education Committee?—Yes.

867. I mention that to show that you have very considerable experience in educational work of this character in different parts of the country.—Yes.

868. With regard to one question that was asked you as to the salaries, which you think ought to be higher, and for which you would like a higher Government grant, should you also say that it was necessarily desirable that that grant should be assessed according to the amount of salaries that are paid in a particular institution?—Certainly not, I should say, because that would simply be a means of screwing up the salary list—if the grant were decided upon the amount of the salary list.

869. I suppose also the number of institutions that are at present established exist under very different conditions?—Very different.

870. Some are connected with wealthy universities or university colleges, others are more agricultural, and therefore the salaries paid to the members of the staff would not necessarily be a guide to the standard of the work that was being done at those institutions?—No. If you take the case of an agricultural college such as ourselves, we have to provide for the whole of our chemical and botanical teaching from the very beginning, and if you take the case of an agricultural department of a university college the whole of the elementary chemical teaching is done by the resident staff, and the whole of the elementary botanical teaching is done in the same way. Our expenses are very much greater, because we have to teach the subjects which in a university college are taught by the ordinary staff,

Mr. M. J. R.
Dunstan.

1 May, 1907.

Mr. M. J. R.
Dunstan.
1 May, 1907.

and the many other sides that the university college takes up. I do not think it would be wise to base the grant on the salaries, although I know I am arguing against myself, because our own salary list amounts to about 30 per cent. of our expenditure, but still I do not think it would be wise to base the grant to a college on the amount of the salaries paid.

871. The object of a grant must be to induce the particular institution, the college, or whatever it is, to get the highest state of efficiency possible in their teaching?—Yes.

872. There may be other things which point to the state of efficiency as well as the amount that is given in salaries?—Quite so.

873. I think Lord Barnard has asked you a point with regard to research work. You think it essential that a college which is to take a first position should do as much research work as they can?—Absolutely essential. I am perfectly convinced of that.

874. That is a thing which ought to be encouraged by a Government grant, you think, quite apart from the amount of money that is spent upon actual teaching?—Yes, the only thing I would say with regard to research is this, that I would rather that the grant were made for research purposes to the individual who conducts the research for materials only. I do not like a grant being given to an institution for research purposes that may not be applied to research purposes. Supposing I applied to the Council for a grant for a specific purpose, I ought then to provide vouchers to the Council showing I had laid out the amount of that grant in actual materials and apparatus for the work. I do not like a grant which is made to an institution to be swallowed up in the general expenses of that institution. If one applies for

a grant to the Royal Society one has to produce vouchers showing that one has expended the money in the actual materials and apparatus: the researcher gives his time.

875. I think you said you do some work in forestry?—Yes.

876. That is part of your courses?—Yes.

877. Do you get any grant from the Agricultural Department for forestry?—Not at present.

878. I believe there are only two grants for forestry given. You think if a larger sum was available for that purpose you would put in some claim for it?—I think we should.

879. There is one point you mentioned about not increasing the centres for experimental work that was done outside. I suppose it is necessary to have experimental centres in order to give an interest to the farmers living in the immediate locality?—Yes, I regard them as very useful in getting into touch with farmers, but I do not place very much value on them as a means of obtaining scientific results.

880. I take it that one of the first objects of these experimental centres is to get into direct touch with the farmers, and unless you adopt some means of that kind you cannot get hold of them, and get them to interest themselves in the work you are doing unless you bring them into direct touch with the land?—Yes, quite so, but I would prefer to call them demonstrations and not experiments.

881. (*By the Chairman.*) I understand you are prepared to come next week, because there are some members of the Committee who are not here, who would like to put some questions to you?—Yes.

Mr. ALFRED AMOS, called and examined.

Mr. A. Amos.

882. (*By the Chairman.*) You are a farmer of Wye, and are one of those who, originally, about the year 1890, urged on the Kent County Council the formation of the South Eastern Agricultural College at Wye?—I was. I went up with Lord Winchelsea to Maidstone and endeavoured to get them to start it.

883. You felt it would be a great advantage to the counties to have such an institution?—Well, I cannot say that I thought so at that time; but I thought at the time that it would be a good thing for Wye to have the college there, and so I went up and supported Lord Winchelsea. In fact, at that time I was rather a disbeliever in technical education for farmers.

884. Your have since altered your opinion?—Yes, I have. The more I have seen of it the more I have appreciated it.

885. You are now a governor of the college?—Yes.

886. Perhaps you would tell the Committee what, in your opinion, is the chief value of the work which is done at the college for farmers?—I think the farmer who sends his son to the college, sends him there to get what he can inside the college—the sciences that are taught inside the college, and not so much for the practical work that they teach on the farm.

887. You think that the analyses of manures and feeding-stuffs, and so on, are of practical value to the farmer?—Certainly. They enable him to read and understand the analyses that the dealers in manures and feeding-stuffs hand to him when he is buying. Very often an analysis of feeding-stuffs is placed in a farmer's hands and he does not understand it without having been through a chemistry course. He would then be able to understand it and to know whether it was likely to be of value or not.

888. You think botanical instruction is important?—Yes, I think it is, because I know it is a good deal of use to me personally. I have had much valuable information from the professors who have come to my farm, which is close by the college, and they have put me right in a good many respects when I have been working on absolutely wrong lines.

889. You think veterinary instruction is also of importance?—Yes, I think that is very important too.

I know my own losses from want of veterinary knowledge have been very great.

890. You think the practical instruction which is given at the college is proceeding on the right lines?—Yes, I think it is. If I taught practical agriculture, probably I should teach it a little differently to what they do there; but I have just been appointed Chairman of the Farm Committee there, and I hope to get it a little more on the lines of the practical agriculturists in the county, so that they will not be able to criticise the management of it quite so much as they sometimes do.

891. You are of opinion that the gentlemen who teach at the college have something to learn from the practical farmers?—Yes; I think blending the two together does a lot of good.

892. We have had evidence with regard to the lectures given outside the college—lectures given in the rural districts. In some cases these lectures appear to have succeeded and in others they have been a failure. In your opinion, what are the conditions of success which you would indicate with regard to those lectures?—They want organising where they are to be held, and it depends a great deal on the secretary in the district whether he looks around and gets people to come to them or not. Farmers are very diffident about coming and hearing a lecture unless someone takes a little interest in it and says to him, "Will you come along this evening and hear a lecture?" but if nobody approaches him he is apt to let it go by without going to it.

893. You think these lectures should be conducted rather in the colloquial form—that it should not be like a sermon, but more of a colloquial character?—I do not quite understand what you mean by "colloquial."

894. I mean that the lecturer should talk to his audience, and that there should be an exchange of opinions?—Where they go to farmers' clubs and such places that is the way the lectures are conducted. The lecturer generally introduces the subject and addresses the meeting, and then questions are invited and a discussion follows, which is very useful.

895. That is the way in which you think they ought to be conducted?—Yes.

896. With first of all an introductory speech and then

a conversation on the subjects mentioned in the speech?—Yes; and the discussion is very often more valuable than the actual paper, because the farmers get at once to the points they want to find out.

897. (*By Lord Belper.*) That is the way they are usually conducted, is it not, in your county?—Yes, where lecturers go to the farmers' clubs.

898. (*By the Chairman.*) You think those lectures ought to be organised by farmers' clubs and societies, and then, of course, the members would take an interest in them?—You must have some sort of society to do the work of getting the people together, otherwise there is scarcely any attendance.

899. Is the opinion of farmers who have had sons at the college satisfactory?—I think that is most satisfactory. I persuaded my brother to send two of his sons there, and he is very pleased with the result, and I have also persuaded several farmers who are neighbours of mine to send their sons, and they are all very pleased. I have also persuaded some of the students that I know to go back to a farm after they leave the college; and what they have learned at the college has done them a great deal of good—their minds get broadened.

900. Your opinion as to the value of the special information which can be obtained at the college is favourable?—Yes.

901. You think that the advice which can be got at the college is of practical value?—Certainly.

902. Have you any observation to offer with regard to the special work conducted at the college and the details of that special work?—Do you mean outside the college?

903. Yes?—Of course farming operations are carried on and they experiment in feeding cattle and sheep, and there are pigs and bees and poultry, and experiments with regard to the different kinds of wheat and different ways of manuring. Those are all useful. Of course they must be carried out very carefully, otherwise they are misleading. It is very essential that those experiments should be carried out absolutely accurately, otherwise it is very easy to mislead farmers, and it would do them more harm than good.

904. You think it would be advisable to increase the number of those who go about the counties and meet the farmers upon their own farms, and investigate special points on the farms?—I do; I think that a lot of good is done when a scientific man meets the farmers on the spot. The farmer may have a disease in a plant, or he may have an animal that is unwell, and there may be different things where the scientific man can put the farmer right on the spot. I think when the scientific man and the practical man mix their knowledge together it is useful to the practical man a great deal more so than it would be if he were not able to see the thing actually demonstrated.

905. You approve of the summer courses being held for elementary teachers?—Certainly, they are very well attended. The schoolmasters are very pleased to go, and they are very keen on having the opportunity of benefiting by the professors' knowledge; I think it does them a lot of good, because they go about the country not nearly so ignorant on those subjects as they were before.

906. The result is that they can impart some elementary agricultural instruction at their schools?—Certainly.

907. (*By Lord Barnard.*) Am I right in thinking that it is your opinion that, apart from the question of the students and the instruction given to them, colleges such as this are of very great value to practical farmers?—Yes, I think that is so if you can get the farmers to take an interest in them, but they are rather shy of them. If you can only get them to take an interest in them they will get a lot of good from the colleges.

908. Your own personal experience is that it has been of value to you, and you have spread that experience amongst others?—Yes. I have impressed them with the advantage of sending their sons there as much as I can.

909. You have also told us that you are spreading that knowledge by inducing them to ask some of the skilled professional staff of the college to meet them on their own farms?—No, the staff are not able to that. What we want to do is we want some of the professors to take up special subjects, such as fruit and hops, and

to go round the country teaching the farmers, but the staff of the college are busily engaged in teaching just now.

910. You think it is a subject on which knowledge should be diffused?—Yes, the professors have many enquiries addressed to them, and they write hundreds of letters in the course of the year on different subjects.

911. Do you think the elementary teachers appreciate the course also?—Yes, they appreciate them very much and it is very valuable to the counties that the teachers should get that instruction, and should impart it.

912. Are the lectures given gratuitously or is there a charge made?—The expenses of the professors are paid for coming down, and they are paid so much a lecture. I think their fees are paid by the County Council; I do not think there is any charge to the farmer.

913. You have told us that you would have been glad to have had greater knowledge of veterinary science yourself, but are you aware that the profession of veterinary surgeons are not altogether in favour of the science being taught in the colleges?—There is a little jealousy, I know, but the veterinary professor that we have at the college does not take private practice. He acts more as a consulting veterinary. Some farmers go and consult him on different things, but as regards students, of course it must help them considerably.

914. You do not think that amongst the multiplicity of other things that they learn that you could ever turn a student of this college into a veterinary surgeon?—No, and it is not desirable that he should be a veterinary surgeon. Of course he has not the time to go into it as minutely as that, but there are a great many things that he might learn that would be very valuable to him, and would save him when he started farming from all sorts of mistakes and losses.

915. You are of opinion that all they need, as I heard a veterinary surgeon the other day describe it, is to be able to give first aid?—Yes, that is it.

916. (*By Lord Belper.*) You say the professors answer an enormous number of letters from the college. They give practical advice to the farmers if they chose to write and ask them for it, do they not?—Yes, they give the best advice they can.

917. Supposing a farmer gets into a difficulty for some special reason and he writes to the college, they will very likely be able to tell him what has gone wrong, and he will probably be able to put it right?—Exactly.

918. That sort of communication with the farmers brings the farmers to understand the great benefit that some scientific knowledge may be to farmers?—Certainly.

919. (*By Mr Latham.*) There was one remark made by Mr. Dunstan that I rather took offence at. He said he did not think it was any good making students second-class labourers. My impression is that if I personally had not gone through my work from the beginning, and seen every one of the young men working as labourers, that I should never have been half as good a man as I am at the present time. Do you think there is any harm in teaching a young man to work from the bottom, and do you consider he is ever as good a farmer if he does not possess that knowledge?—Well, I was brought up to it myself, but I may say that I have never ploughed an acre of land in my life, and I have never sheared a sheep in my life, but I very often do the judging at ploughing matches and at sheep shearing matches, and I think I am able to tell when it is done properly. I would suggest that if you wish to teach the young men manual labour, you should do so on a farm, or have a professor of labour at a college, a plan that personally I do not think would be workable, for it takes years for a man to become an efficient labourer. I do not think it is really part of the work of a college to teach bodily labour.

920. No, I do not think it is, but it would not be right to call him a second-class labourer because he knew all about it. The great secret of the success of this country was, in my opinion, because of the old-fashioned system of apprentices to the different trades, which system seems to have decayed somewhat. With regard to the courses for elementary school teachers, are you of opinion that they might be extended?—As it is, the professors spend part of their summer holidays in instructing the teachers, and it would cut their vacation very short if they had to do more than they are doing at present.

Mr.
A. Amos.
1 May, 1907.

Mr.
A. Amos.
1 May, 1907.

921. Is there any provision for the elementary teachers teaching what they have learnt at these summer courses in their schools?—I do not know.

922. The Board of Education, I suppose, do not value that very much, then?—I am unable to say.

923. Is your opinion of this college supported generally by farmers in the neighbourhood?—I think so. I could mention several farmers who could come and tell you of the value they have got by sending their sons to the college.

924. Does your view represent the view of the minimum or the maximum?—I do not know one who regrets having sent his son to the college.

925. Do you think the sons of farmers are following their fathers' occupations more or less now than they used to do?—I think it is about normal.

926. Do you think there are as many sons of farmers going to be farmers now as there used to be, and not going into other trades?—Yes, I think so. It is not so in my own case, but I think it is so generally.

927. With regard to these lectures that there has been a very great deal of fun made of, do you find that the lecturers generally know pretty well what they are talking about?—In their special subjects, yes.

928. It is an unfortunate thing that men sometimes do talk about what they know nothing?—It is quite possible.

929. There is one remark I very much wish to call your attention to. In Mr. Dunstan's evidence he spoke about preferring to conduct the experiments at home. Are not your ideas rather against what he said. I should have thought you wanted experiments all over the country in order to treat the different classes of soil?—I think experiments are carried on all over the country.

930. He said no?—They are extending them out a bit. They have carried them on for several years now, and then they compare the results with other districts so as not to go entirely by what happens in the one district.

931. One other remark about veterinary instruction which Lord Barnard put to you. Is there any feeling in your district that the teaching of veterinary science in the college is doing the veterinary profession any harm?—I do not think it is doing the veterinary profession any harm. It is really wanted more for trivial cases where a man would not call in a veterinary surgeon. If the farmer knew how to treat his stock himself he would cure it, and it might take work from the veterinary surgeon; but, at the same time, if the farmer had a slight knowledge when the veterinary surgeon came, and said that different things wanted to be done to the animals the farmer with his little veterinary knowledge would be able to carry out his instructions very much easier.

932. Can you give us the line that the veterinary instruction takes?—No. I do not know about the lines. The students are all taught in the way of lectures.

933. You consider that instruction very valuable to the farmer?—I think so.

934. (By Lord Barnard.) Lord Moreton points out to me, and I think it is what Mr. Dunstan meant, that we must draw a distinction between experiments and demonstrations. I suppose Mr. Dunstan meant that experiments could be better carried on at the college, but you could give demonstrations better about the country?—Yes. I think experiments carried on about the country are not so reliable as those carried on on the farm, because they are not carried on under the eye of the professors, and something might happen which they are not aware of, and it might be very misleading.

935. (By Lord Moreton.) Therefore, you would consider the wise course would be to have all the important experiments carried out, so to speak, at the college; and to repeat them you might have a demonstration away from home?—Yes.

936. (By Mr. Latham.) The difficulty is that a great

deal of the experiments would apply to certain soils, and they could never be carried on at the one spot?—That might be so, but there are many that are carried on at the college and away too.

937. (By Mr. Medd.) Mr. Latham suggested to you that the teachers who attend the college might have a more extended training. Are you aware that in some counties they attend every Saturday throughout the year—in Wiltshire, for instance, in Cheshire, in Derbyshire and in Middlesex. The teachers there attend for instruction every Saturday throughout the year. Have you heard of that?—No, I have not heard of that; but that would be very difficult where you have a lot of students at the college at the same time.

938. That difficulty is not felt at the Holmes Chapel College or the school at Dauntsey, and I was going to ask you whether, as a Governor of the Wye College, you might consider whether it enables the teachers to study those things at every season of the year—nature and natural life. That would lie with you and the governing body and the principal of the staff?—It would do a good deal of good I should think.

939. You have found that the result of this training is of benefit to the village schools in Kent?—I have not found it personally, but it must be so, I should think.

940. You do not happen to have visited the Chislehurst Road School at Orpington and the Orlestone School do you?—No.

941. They happen to be two of the very best in the world. They are visited by people from Japan, and from the continent, and different parts of the world, and they might be taken as models for the rest of England, and they are in your own county?—I have not visited them.

942. Have you happened when travelling abroad to have seen any type of foreign school which if introduced in this country might be useful to farmers' sons?—I have never travelled abroad.

943. Have you any views as to what should be offered to the small farmers' sons and the labourers?—The small farmers find it more difficult to spare their sons than the larger class of farmers do.

944. What would you offer to the man who cannot afford to send his son to such a college as Wye, but who really wants his son to get some benefit from scientific knowledge?—If he can get a scholarship he can go to the college free.

945. That of course entails a three years' absence?—Two years.

946. You have no suggestion to make as to what might be brought to his own doors in the way of continuation classes?—No, I have not.

947. Do you come in contact at all with the official correspondents of the Board of Agriculture?—No, I do not.

948. Do you think it would be of service to you, as a farmer, to have a permanent consultative Committee with representatives in London, associated with the Board of Agriculture, to meet periodically and discuss agricultural and educational questions?—I think that would be a good thing.

949. Thank you very much, that is all I have to ask you?—I might say with regard to the schoolmasters, that when they first came to the college, they seemed to come with the idea that there was nothing to learn, but after they had been there and gone through their fortnight, they went away so pleased that they are all anxious to come every year now.

950. I may say that Mr. A. D. Hall invited me to hear his inaugural lecture, and I was greatly struck by his simple treatment of the subject and the keen interest of the teachers. I know how valuable his example has been, not only to Kent, but to the whole of England. You initiated this method of training teachers, and you deserve the greatest credit for it?—It must be of great benefit.

THIRD DAY.

Thursday, May 2nd, 1907.

PRESENT:

The Right Hon. Lord REAY, G.C.S.I., G.C.I.E. (*Chairman*).

The Lord BARNARD.

The Lord BELPER.

Lord MORETON.

Mr. DAVID DAVIES, M.P.

Mr. NORMAN LAMONT, M.P.

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Professor T. H. MIDDLETON, M.A., M.Sc.

Professor WILLIAM SOMERVILLE, D.Sc.

Mr. H. S. STAVELEY-HILL, M.P.

Mr. A. E. BROOKE-HUNT (*Secretary*).Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. J. H. NICHOLAS, M.A., Secretary of the Essex Education Committee, called and examined.

951. (*By the Chairman.*) You are Secretary to the Essex Education Committee?—Yes.

952. Will you kindly explain to this Committee the origin and nature of your work at Chelmsford?—I think I may say that it began when the Customs and Excise Duties, called the "whisky money," were handed over to the County Council. Previous to that very little had been done in the way of agricultural education, except, perhaps, at shows. When the "whisky money" was handed over, the County Council appointed a Committee, and passed a resolution directing the whole of it to be appropriated to education. There were good representative farmers upon that Committee, and agricultural education was one of the matters it took up. That was in 1892. Shortly afterwards the Committee, upon the Report of a Sub-Committee, considered it necessary to appoint two experts, one for agricultural chemistry, and the other for biology. These two men were carefully selected, namely, Mr. Dymond and Mr. Houston. They set to work at once to find out the best way in which agricultural instruction could be provided, and they began by giving lectures. Mr. Dymond is a chemist, and he soon got on to agricultural chemistry. By means of meetings with farmers and by local lectures, a development was made upon the lines of establishing a kind of central institution. As the matter was not sufficiently advanced to justify the erection of a new building, we bought an old grammar school, and in it one room was appropriated for chemistry under Mr. Dymond, and the other for biology under Mr. Houston. That was the beginning of our institution. In the other parts of the building we had a few offices for the staff, &c. The work of these two men proved successful, and was much appreciated by farmers and gardeners. Mr. Dymond chiefly directed his attention to farming subjects, and Mr. Houston made a special feature of gardening and botany. That is how the matter got to be subdivided into two—one section, the agricultural, with Mr. Dymond at its head, for farmers; and the other, the biological, under Mr. Houston. Special classes were started, and very soon we found there was not sufficient room in the building for the classes. In 1896 we built a small biological laboratory at a cost of about £700. As the classes did so well we appointed some assistants to help the two men I have named in their different departments, and in 1903 we were able to erect the present Technical Laboratories, which were opened by Lord Onslow. That is the present state as to the building. You will find particulars of the work done on page 8 of our Higher Education Report for 1906, which has been placed before your Committee. One wing of the building includes rooms set apart for instruction in agriculture; that instruction consists of a nine weeks' course for young farmers in winter. We found as the result of experience that in our county, at any rate, the thing would work much better if we took the young men intending to become farmers at a time when they could be spared for a nine weeks' course, leaving them the rest of the year to work on their farms, instead of taking them away from that work for a whole twelve months at a time. They are thus kept in close touch with farm work, and in quiet times they came to our laboratories to get special instruction bearing upon agriculture dealing with such subjects as chemistry, stock feeding, manures and dairy work. We felt that by helping these

young men in this way we should be improving the type of those who would eventually become the farmers in the county. The nine weeks' courses to which I have referred have been exceedingly successful. Last year we had about 20 young farmers attending, and there is reason to be pleased with the type of young men who come in. In the basement we have the dairy school. At one time we had a travelling dairy, but having opened the eyes of the people by its help to the importance of dairy farming, we thought the matter could be worked at less expense, and perhaps with better effect, in a central institution where we could deal with bacteriology as well as dairy work, cheese-making, &c. We get a constant supply of pupils who come into the dairy school for courses ranging from two to six weeks.

953. (*Chairman.*) Women?—Chiefly women, but I counted four men, practical farmers, taking the present course. A great deal of cheese of all kinds is made there. It may interest the Committee to know that last year we made one ton of Derby cheese, two tons and a half of Cheddar cheese, two hundredweights of Wensleydale, and one hundredweight of Stilton, as well as a small supply of Cleveland and various soft cheeses. The kind of cheese turned out depends on its treatment. Ordinary dairy work, such as treating the milk and making the butter, is, of course, part of the curriculum of the dairy school. On the other side of our building there is a block devoted entirely to biology, which includes botany for the horticultural students who come to the school garden. They spend the morning in that room for instruction in botany, and in the afternoon work in the school garden. At first we had simply three weeks' courses and then let the students go away, but we thought that too short a time; and eventually settled to give three three-weeks' courses and one four-weeks' course, which completed the year's work. Young gardeners came up and took these courses. The school garden, consisting of three acres of land, is about a quarter of an hour's walk from the laboratories. We put up a shed there for tools and potting, also a greenhouse where practical instruction is given to the students. Since the passing of the Act under which education was handed over to the County Council, we have been making a strong effort to get elementary school teachers in for vacation-courses, with a view to their giving instruction in horticulture in the elementary schools. We have also school teachers coming in to Saturday classes at the Institution, and we have been able to start a large number of school gardens in the county. Their number is increasing rapidly. There were some special agricultural classes on Wednesdays, but as a rule we find that young farmers cannot so well be spared in the middle of the week, and consequently not much has been done in that matter. On Fridays—the market day—there have been market day lectures given—lectures for farmers upon all kinds of subjects bearing upon agriculture. These are not necessarily given by our staff; in fact, only a few have been given by our staff. They are given by expert farmers and others who come down to lecture on special farming matters. These lectures, usually limited to half an hour, have been exceedingly well attended and, I believe, highly appreciated. A member of my Committee, Mr. Goodchild, who is here, will be able to tell you what is the opinion of himself and his colleagues as to the effect of such lectures

Mr. J. H.
Nicholas.

Mr. J. H.
Nicholas.
2 May, 1907.

953c upon the farmers. In addition to all that, we have agricultural analysis. It was found very desirable to give farmers some practical instruction in dealing with soils, and we arranged to have analysed for them various manures, with a view to seeing what should be applied to particular soils. The foods supplied, and the milk and the seeds, are also tested for them on their request; in fact, with regard to all matters of practical benefit to them, we try to meet their wants. These analyses have greatly increased. Farmers have got to appreciate them, and they come to get advice as to the best mode of dealing with a certain soil, and whether certain manures are suitable. The best advice that can be given is given by our staff. We have also had field experiments with the double object of illustrating the principles of manuring, and investigating the manures best adapted for permanent pasture and tillage crops on Essex soil. The soils vary very much in different localities, and we have made a large number of experiments right through the county. These are all worked from the central laboratory with the help of the farmers in the locality, who are particularly keen in this matter. After the results are ascertained field meetings are held, and the farmers are much interested in the matter. We have considerable field meetings all over the county with regard to different experiments, which are explained by the staff. We expect the staff, of course, to learn some things from the farmers, just as the farmers learn from the staff. At all events, the farmers express their opinions, and often, I believe, great benefit is derived. At various times publications bearing upon interesting matters connected with agriculture are issued by us for the benefit of the farmers. I have some of them here, but I need scarcely trouble your Committee with them. I may perhaps mention the circumstance that we had an inundation of the sea in a certain part of the county, which ruined hundreds of acres of land, and the practical question was how to deal with it. Our staff were called in and gave the best advice they could, guided by their knowledge of what had been done in other places, and I hope this was of use to some of the farmers. I have had enquiries from a distance, and even from so far as Fiji, for particulars desired by persons who have heard of our experiments.

953d There is another feature which I would like to mention. It is that each year the staff arrange a visit to interesting places for farmers. Once they took a party to Holland, and as there is much dairying done in Essex the party of visitors were much interested in seeing how milk was dealt with in Holland. At another time one of our parties went to Hungary, which was particularly interesting. We found that the Hungarians devote a great deal of their public interest to farming. Indeed, one of the chief impressions left upon my mind was that the Hungarians were doing everything for agriculture, whilst we in England were doing practically nothing. Last year we made a visit to Scotland, and we are arranging a visit to the North of England this year. Our farmers are keen to go, and I think these visits have a good influence generally. With regard to farm labourers, it has been rather difficult to find suitable matters in which they really take a keen interest. We have evening classes for young fellows, and we find that ploughing instruction has been taken up successfully. Perhaps half a dozen lessons are given at a centre for young men on the farms, and sometimes for older men as well. That has been done at a large number of centres, and a particularly pretty sight it is to see the competition on a fine day with all the horses in the field. That has been much appreciated. We have also tried thatching and stacking, and to a certain extent it has been successful, but we have not done much with this up to the present time. Woodwork is one of the things we have found useful, rough carpentering to make the agricultural labourer a handy man. They have been taught to make such things as ladders and milking-stools, perhaps of a somewhat rough character, but that work has been well taken up, and I think has been very useful.

953g 954. (By Lord Moreton.) Would you give a definition of woodwork?—I mean rough carpentry and the use of tools. The field experiments in 1906 dealt with varieties of wheat, varieties of mangolds, the effect of manures on mangolds, manuring of maize, manuring of picking peas, the effects of a second dressing of basic slag to London clay grass land, &c. With regard to our publications, if any member of the Committee would like to see them, I shall be glad to furnish copies.

955. (By the Chairman.) How many centres have you in the county?—There is only one central establishment and that is at Chelmsford, from which our staff go out to other places to lecture, to visit farms, or to supervise the experiments. With regard to practical horticulture the

gardener goes out to various districts lecturing and teaching during the winter upon the treatment of trees and gardens. With regard to the subject of expense: that has been rather a troublesome point with us. At the present time our central Institution costs us about £3,000 a year, without reckoning anything for interest on capital or for rates. We have applied to the Board of Agriculture for funds on several occasions, but I understand that, although willing, they were unable to find means to help us. I have, however, to thank Mr. Brooke-Hunt for his valuable help all the way through. He has been down often to see us, and whenever we wanted his advice he has always been particularly good in giving it, and in helping us to the best of his ability with his knowledge of how agricultural matters are carried on in other counties. Hitherto we have had but little in money from the Board of Agriculture. If this had been an engineering school, or a school of art, or some other grant-earning school under the Board of Education, we should probably have been receiving a £1,000 a year from public funds. But the matter was in an experimental stage, and we thought it better in some respects that we should remain more independent and pay the piper so far as we could, and in that sense we have kept the thing in our own hands. The two excellent men with whom we started have now been taken from us, one by the Board of Education, Mr. Dymond, as their Inspector in Agriculture; and the other Mr. Houston, is now in Ireland. The chief farmers have shown themselves willing to help us, and we thought it better to work out our own salvation in our own way, even if it cost us a little more; and that is what we have done. Two years ago the Board of Agriculture wrote us a sympathetic letter, and added that out of their grant for such a purpose they had only a balance left of £200 if we cared to accept it. I thought we had better do so. This year we had that £200, but as we found that our Instructor had been transferred to the Board of Education, we thought we might perhaps with more safety place ourselves, as an experiment, under that Board. We did so, and we received £400 from the Board of Education, which brings our income from Government sources up to £600; but we have had a notice from the Board of Education that they have done this rather hesitatingly, and that as they found we received a grant from the Board of Agriculture, they did not think they could continue theirs so as to make grants from two Departments, but that if we made a special application it would be considered. We have made a special application, but I do not yet know what will come from it.

956. How was the money provided for the building?—By the County Council from the "whisky money."

957. Was a loan raised?—No, we accumulated the first year's money, and were then able by a little manipulation to do without a loan.

958. You paid it out of revenue?—Yes.

959. Then practically, with the exception of the two grants you have mentioned, you depend upon the money given you by the County Council?—Yes.

960. Are the lectures for farmers well attended?—They have been well attended. I should say that as a rule we have had probably 30 or 40 farmers attending.

961. Are these lectures mostly of a practical character?—Yes; entirely. I can give you as an example our course for 1905-6; it is as follows:—

Oct. 6.—"The Breeding and Rearing of a Dairy Herd and the Value of a Milk Record," by Charles Marshall, Secretary of the Northumberland and Durham Dairy and Tenant Farmers' Association.

Oct. 13.—"Concerning Sheep and Essex," by W. J. Malden, Surbiton.

Oct. 20.—"Pigs, Past and Present," by Sanders Spencer, Holywell Manor, St. Ives, Hunts.

Oct. 27.—"The Farm Orchard; its Place and Management," by C. Wakely.

Nov. 3.—"The Production of Milk," by F. J. Lloyd, F.C.S., F.I.C., Consulting Analytical Chemist and Dairy Bacteriologist to the British Dairy Farmers' Association.

Nov. 10.—"The Advantages of Poultry Keeping to the British Farmer," by W. F. Snell, Dairy and Poultry Farmer and Instructor in Poultry Keeping, Yeovil.

Nov. 17. "Clean Milk and how to Produce It," by J. C. Thresh, M.D., D.Sc., F.I.C., Medical Officer of Health for Essex.

Nov. 24.—"Surplus Milk," by B. W. Bull.

Dec. 1.—"The Field Culture of the Potato," by Alec Steel, Prittlewell.

Mr. J. H.
Nicholas.
2 May, 1907.

- Dec. 8.—“England as a Producer of Sugar from Home-grown Sugar Beetroot,” by Sigmund Stein, Sugar Expert, Liverpool.
- Dec. 15.—“Some Agricultural Facts and Figures,” by R.H. Row, Board of Agriculture and Fisheries.
- Feb. 9.—“Basic Slag as Phosphatic Manure for Roots,” by W. A. Cox, of the Agricultural Department, Chemical Works, late H. and E. Albert.
- Feb. 10.—“Sheep; the Management of the Flock,” by Fred. Smith, Woodbridge.
- Feb. 16.—“Economy in Manuring,” by Professor Douglas A. Gilchrist, M.Sc., F.R.S.E., Armstrong College, Newcastle-upon-Tyne.
- Feb. 24.—“Meteorology in its Relation to Agriculture,” by Wm. Marriott, of the Royal Meteorological Society.
- Mar. 3.—“Mendel’s Principles of Heredity with some Applications,” by R. C. Punnett, M.A., Gonville and Caius College, Cambridge.
- Mar. 10.—“Wheat Growing,” by Wilson Marriage, J.P., C.A.
- Mar. 17.—“The Growing of Barley,” by C. N. Brooks, C.C., Mistley.
- Mar. 24.—“The Manuring of the Mangold Crop,” by Dr. Bernard Dyer, F.I.C.
- Mar. 31.—“The Farmer’s Pig,” by Sanders Spencer, Holywell Manor, St. Ives, Hunts.

962. Have any experiments been made with regard to beetroot cultivation?—Yes, considerable experiments. I produce and hand in a record of them.

963. Perhaps you will explain to the Committee about the meetings of gardeners to which you refer?—These meetings are of a somewhat recent date. They are held in Chelmsford on Friday evenings. They are taken charge of by our biological department and the gardeners are invited to come in for discussion upon certain branches of their work, such as the best potatoes for their district, or the best way of growing any particular kind of crop, or different kinds of flowers. They bring in specimens and there is a discussion, and the gardeners themselves state their experiences. We have had the room packed. I have counted nearly 100 men in it, indeed the room could not hold more. This is almost regularly so on Friday evenings. It is run in a great measure by the gardeners themselves, who appoint their own secretary, although we lend the room and give the help of our staff. There is another class of the kind at Maldon and one at Colchester. Probably the movement will still further extend. The farmers are keenly interested. Sometimes perhaps a well-known lady or gentleman will come and give an address about flowers, say dahlias, and the men who are interested come and give their experience: that is very informing and I think it does much good.

964. As the result of attendance at your winter school, do some of the students desire to get further instruction at college?—That is rather a difficult subject. We have, as a matter of fact, given scholarships, tenable at some place of higher instruction. We have done that in two cases, but we are not sure that the man who comes back is the farmer. Perhaps he finds something more profitable than farming to do, or he may go to another country. We look upon this as a small matter compared with what is done in our own school whilst at the same time keeping the students in practical touch with farming.

965. You do not give much encouragement to your students to go in for higher education?—Yes, we offer scholarships in suitable cases. We have given scholarships of £60 in a year, and we have sent two or three to Cambridge, and to places in the North of England.

966. I understand you are doubtful about that policy?—Yes, doubtful about the result. Doubtful whether it is beneficial in proportion to the cost. The father of one who came out near the top last year came to ask me whether he should pay the difference and send his son to Cambridge, but after talking it over we were not sure whether from a practical point of view it was not better to keep him in touch with the land, and whether he would not in that way become a better practical farmer than if he had gone on with the scholarship. I am not myself expressing a decided opinion, but that is an open question.

967. There is no farm attached to your institute?—No: we got over that difficulty by taking the students to different farms in the neighbourhood, selected as specially of interest in regard to cows or sheep or wheat.

968. You have no difficulty in getting access to such farms?—No; the farmers are generally pleased for us to come.

969. Do you think the length of the course in your winter school is sufficient, or would you like to see it made longer?—As the result of experience, and after thinking over the matter from the farmers’ point of view, we think it is better for the young farmers during the greater part of the year, to keep in practical touch with their own farms.

970. When students have attended the winter course, do they in many cases come again in the following winter? Yes, some come for a second year.

971. (*By Lord Barnard.*) I think you have not yet given the Committee any account of the body which controls and supervises the whole of this instruction. I see in your printed report a list of an Education Committee consisting altogether of about 47 members?—There is also a small agricultural sub-committee of which Mr. Goodchild is the Chairman, and the other two gentlemen present with him are his colleagues. All three of them are farmers. We have always made a point of endeavouring to secure the co-operation of the best men available in each special branch.

972. How often does that agricultural sub-committee meet?—Once a month. There is also a visiting sub-committee which meets about once a fortnight.

973. Do they keep regular minutes, and submit them to the Education Committee?—Yes; these are printed every month.

974. All business eventually comes before the County Council?—Yes.

975. And is approved at the quarterly meeting?—Not necessarily at that meeting. The powers of the County Council in this matter are delegated to the County Education Committee.

976. Do all matters come before that Committee?—Yes, every detail.

977. You act as secretary to that Committee?—Yes.

978. As to finance: does that Committee requisition what they require, or are they granted a certain sum and left to do the best with it?—An estimate is submitted each year. We look chiefly to the County Council, and we know how much we can get. If anything extra is required we send up a report, and generally get it carried through without difficulty.

979. There is no disposition on the part of the County Council to object?—Not at all.

980. Is there any disposition to increase the grants from the County Council?—We do not consider it a grant. We look upon our establishment there as that of an institution maintained by the County, and on general lines the County finds sufficient funds to run it.

981. (*By Lord Belper.*) Does the sum you spend on agricultural education come out of the money which the County Council has for Secondary Education?—Yes; it comes out of the general fund.

982. Do they raise a rate?—Yes, a penny rate, and the rest comes out of the so-called “whisky money.”

983. (*By Lord Barnard.*) Have you a copy of your accounts?—I have a statement of what it costs to run the Institute and laboratory.

984. Is any proportion of your salary or other administration expenses charged to the agricultural Sub-Committee?—No.

985. Your county gives a large proportion of the residue grant; I think 16.44 per cent., whereas the average is little more than 12 per cent.?—I hope you will not make too much of that.

986. You don’t have any regular long course of instruction in addition to the short courses you mentioned; no year’s course?—This year, in the case of a young man who won an agricultural scholarship, as it was not thought desirable that he should go away for twelve months, we gave him £10 and free use of our laboratories with assistance from the staff. He is going in for land agency and surveying.

987. Do you in any way test the results of the instruction given; I mean have you any certificate or examination?—They always have examinations at the end of the course. The agricultural examination is done by the University of Cambridge.

988. What about the ages of the students?—Those who attend the agricultural classes will be about 18; and those who attend the horticultural classes are probably, as a rule, about 15. The teachers who attend the Saturday classes are men and women—generally of middle age.

Mr. J. H.
Nicholas.
2 May, 1907.

989. Where were the lectures delivered of which you read a list?—At Chelmsford and Colchester.

990. I gathered from what you said about the young men going to Cambridge, that your object is limited mainly to educating young men who are going to be engaged in farming work?—Yes.

991. You don't want to extend educational facilities to young men in other professions intimately allied with farming, such as agricultural valuers, land agents, maltsters, &c.?—The Committee would be sympathetic and disposed to be helpful in any such cases if meritorious and suitable.

992. You gave up your travelling dairy?—Yes. The expense was too great to continue permanently. We worked the travelling dairy all through the county and then decided to centralise.

993. The public hears much sometimes of the Great Eastern Railway and its shortcomings, but is not Chelmsford well situated for railway facilities?—Yes; both for London and other parts.

994. You don't draw any students from London?—We have had one from Middlesex.

995. In regard to analysing under the Food Stuffs Act, I see your report states that you will not undertake work which should be done under the Act?—Yes. We want to give the farmer such help as he cannot easily get in any other way.

996. Do you find that the funds at your disposal are insufficient?—We could spend a great deal more money—

997. No doubt; but could you do so profitably?—Yes, we could make good use of it.

998. In what way would you extend your operations?—It is possible we might arrange for sub-centres or for getting additional men to work up the districts by lectures and matters of that kind, but I think as a whole at the present time we should go slow in developing.

999. You do not contribute anything to Cambridge, do you?—Yes, we give them £100 a year.

1000. Do you include that in the £2,900?—No, that is not included here.

1001. Do you include the scholarships in the £2,900?—I mentioned £3,000 roughly as what we spent.

1002. Yes, call it £3,000. The £3,000 does not include the whole of the money spent?—No; I should think we probably spend £1,000 more for instruction in ploughing &c., and for other rural courses. It is a big item for our county, and I am afraid one day we shall get it reduced.

1003. You told us you have worked out your own salvation. I presume you mean by that that your Council evolved this scheme of itself entirely?—Yes, with our instructors and others, and this is the best result we could possibly get from our experience and knowledge.

1004. You did not model your scheme on that of any other county?—We did not. We were glad to get particulars from other counties, but we made a point that we would have something that would suit our own county.

1005. Has any other county worked on similar lines that you know of?—I should not like to answer that.

1006. You have given us one very interesting piece of information, namely, that you have had the experience of being under the Board of Agriculture and under the Board of Education. Can you tell me at all what the feeling of the agricultural classes is on that subject?—In what way?

1007. Do you think that the Board of Agriculture or the Board of Education is the most satisfactory?—Without expressing my own opinion I should say that farmers would be distinctly more in sympathy with the Board of Agriculture than with the Board of Education as such. I do not say whether it is justified or not, but I think that would be the opinion. Our friends here, however, will be able to give you a better answer perhaps.

1008. (By Lord Belper.) I only want to ask you one question arising out of what Lord Barnard has asked you. As I understand, your expenditure on agricultural education comes as you said out of the funds at the disposal of the County Council and from the Government grant, and of course that is adopted by the County Council when it is brought before them at their annual meetings?—Yes.

1009. Can you tell me whether in addition to that it is the custom in your county that the estimates of Education for the Education Committee, including your agricultural estimates, would all have to be passed by the Finance

Committee of the County Council before they are adopted at all at the end of the year?—That is so; they have to go before the Finance Committee.

1010. The estimates for the coming year would have to be approved by the Finance Committee of the Council—I do not mean the Education Committee—before they are finally adopted?—That is so.

1011. If there is any alteration in the estimates I suppose that would be made at the October meeting, and a supplementary estimate would have to be produced before the October meeting of the County Council?—That is so. I may say we have a very sympathetic Finance Committee at present, and we have no difficulty with them at all.

1012. That gives a complete check, no doubt, to the County Council as to how the money is going to be spent, and it would prevent you from exceeding your estimate?—Yes, they are very careful about that. Having once estimated even for our buildings we must go with a supplementary estimate to them if it has to be exceeded.

1013. You have to bring that forward at their meeting in October?—That is so.

1014. (By Mr. Lamont.) I think your Education Committee organised expeditions to Denmark, Holland, and Hungary some time ago?—Yes.

1015. Those no doubt were very valuable in their results?—I think they were very informing and very useful. It has a tendency to broaden men's minds, if nothing else.

1016. Certainly the reports that were published of those expeditions were very valuable in many parts of the country?—Yes.

1017. How were those expeditions paid for; did the expenses come out of the County Fund?—No; the farmers paid their own expenses, but those of the staff who went were, of course, paid by the County.

1018. That expedition consisted not only of farmers but of landowners and land agents, and was widely representative of the different classes in the country?—Yes, that is so, but all interested in agriculture.

1019. Apart from the three that I have mentioned, to Denmark, Holland, and Hungary, have there been any further expeditions?—There was one to Scotland, and we are just arranging another to the North of England, starting on the 25th May.

1020. Have you found that the farmers and landowners who went on those expeditions have shown any greater inclination than others to adopt the methods which they found successful in those countries which they visited?—I am not sufficiently acquainted with their methods on the different farms to say that, but I think we found them very much more sympathetic with regard to agricultural education and development generally, and if I may say so, more open-minded with regard to the agricultural work that was being carried on in the County.

1021. I suppose the knowledge that they must have gained of the working of the agricultural and secondary schools in Denmark must have opened their minds to the value of agricultural and scientific education?—Yes, undoubtedly, and the treatment of milk and similar matters. It has a good influence on the farmers, generally, because they talk over these matters at their market dinners, and so on, and it gets a good feeling in the County, and works well.

1022. I imagine the reports are drawn up by the secretary to the expedition in accordance with any notes furnished him by any member of the party?—Yes; as a rule all the notes are sent to the chief who is in charge of the visit, and he puts them together, and they are published in a book. There is rather an extensive one on Hungary, and shorter ones on the others.

1023. The Hungary one is illustrated?—Yes.

1024. The report is not published at the expense of the members of the expedition, is it?—They all pay so much towards it.

1025. (By Lord Moreton.) You told us that there was no farm in connection with your courses, and that pupils were taken to various parts. Was any instruction given them on those occasions in the judging and valuation of livestock?—Not specially, but when seeing stock, almost the first thing they get on to is "What is the value of this?"; there is nothing like a lecture, or anything of that kind, but it is an item that is always considered.

1026. There is nothing done to try and interest them in the difference between a good animal and a bad animal?—

Mr. J. H.
Nicholas.

2 May, 1907.

Yes, undoubtedly there is. We have special lectures on stock and other matters that include that.

1027. Do you do anything as regards teaching them elementary veterinary science? I will put it in another way—the same question was put by Lord Barnard yesterday—is there anything done towards teaching first-aid in veterinary work?—I should say not, at the classes. We have had travelling lecturers—we have employed veterinary surgeons themselves who have gone and given lectures on this in the various districts.

1028. I take it those would be attended chiefly by the fathers of the pupils?—Chiefly.

1029. But what as regards the pupils?—We do not employ veterinary surgeons to give lectures at the institution.

1030. If you had more funds at your disposal do you consider that that would be a useful subject to take up?—Yes, I do; and I think in that direction if we could send further men out it would be a valuable thing. Those lectures that were given were well attended, and were valuable ones, but we had to drop them.

1031. I was not quite clear when you were describing the lectures to gardeners, whether they were market gardeners or general gardeners?—Both.

1032. (By Mr. Staveley Hill.) On page 66 of the Annual Report on the Distribution of Grants, with regard to the finance, as to which you have been asked some questions, it says: "The fees for miscellaneous receipts amount to £86? (Handing book).—The fees in the laboratories, and miscellaneous receipts mentioned in the Board of Agriculture book?"

1033. Yes.—We have fees for instruction in horticulture and dairying and agriculture, but those are fees paid by outside counties, who send some of their pupils to us.

1034. I understand. With regard to these market day lectures, there are a great many market towns in Essex, are there not?—Yes, a considerable number.

1035. Do you go round them in turn?—Yes, but we chiefly go to Colchester and Chelmsford. Sometimes to Braintree; sometimes to Maldon, but generally Colchester and Chelmsford. The other centres should be attended to, but we do not go as widely as that.

1036. It is pretty well known throughout the county that there are such lectures?—Yes, but we do not cover the county generally as we do with Chelmsford and Colchester.

1037. Do you find the number of students attending the classes you hold have been increasing?—Yes, and with regard to agriculture a better class of student also.

1038. (By Dr. Somerville.) You were telling us about the teachers in elementary schools coming up to Chelmsford and getting special instruction?—Yes.

1039. Do those men go back and teach only gardening in their schools?—Not necessarily. We have developed gardening for these teachers rather more specially since the late Act came in. But they would take nature studies and some elementary science.

1040. Do you think any of them attempt to teach the principles of agriculture under the Board of Education Code?—Oh dear no.

1041. Is the principles of agriculture not taken as a subject in any of the schools in Essex?—No, it does not seem to be suitable for youthful minds.

1042. That, of course, is a matter of opinion. There are hundreds of places where the principles of agriculture are taught?—But not in our county.

1043. The requirements of young farmers are met with almost exclusively through the agency of the short courses to which they resort in Chelmsford?—The nine weeks' course.

1044. The market day lectures are intended rather for men who are actually engaged in the business of farming?—Yes.

1045. You do not go in for local systematic and continuous courses of instruction in agricultural science for young men, do you?—We find it such an expensive matter. If we took it we would have to cover really dairy work and biology and chemistry to do it properly, and we think they can get that better at our central institution.

1046. Still in that way you touch only a very small proportion of the total number of agricultural youths between

the age of 16 and 20, we will say?—Yes, a very small proportion probably.

1047. The rest are not directly affected by the organisation?—Not directly—indirectly, doubtless, to an extent.

1048. I do not suppose you would know what the agricultural population in the county of Essex between the age of 16 and 20 would be?—No, I could not tell you.

1049. The Committee may take it that by far and away the larger proportion of the youthful farmers do not directly come within your influence?—Directly, I should say that is so.

1050. In the County of Essex there is a so-called agricultural school in Dunmow, is there not?—I do not know what it is called really; I think they call it a technological school now, for pupils, boys and girls, up to about 14 or 15 years of age.

1051. It does profess, does it not, to give something in the nature of agricultural education for youths?—Yes.

1052. Do those boys come to the Chelmsford classes afterwards?—No.

1053. Still, I take it, they are Essex boys?—But it does not follow they are going in for agriculture. At one time it was treated as a secondary school.

1054. Am I to take it that as far as you know agriculture is not taught there now?—They teach certain agricultural subjects.

1055. May we not assume that the boys take those subjects with the intention of becoming agriculturists?—I suppose so.

1056. You do not know whether in fact they go and get superior instruction later on?—No, I should say not. There are girls there as well; it is not for boys only.

1057. The Committee may conclude that you are not very much in favour of educating the youths of Essex beyond the point where they would continue to remain in the county and to practise agriculture?—Substantially that is what we are doing. We think in that way that probably we can do more good to the farmers of the county, but wherever we found a youth of exceptional merit desirous of going on for higher work, the Committee gladly give aid, but they are not all disposed to go on even if they do very well at our school.

1058. You would in fact be quite pleased to see him get a post outside of the county subsequently?—Yes; I am sure we would, just as we are pleased when a member of our staff gets a better post, say in Ireland; although it is to our loss we should encourage it.

1059. You have told us you get a certain proportion of your students examined by Cambridge?—Yes.

1060. Is that the only return Cambridge gives you for the £100?—From a broad point of view we have thought that if agriculture could be developed there there are certain well-to-do people in Essex who might be able to profit at Cambridge, and from that point of view we thought we would like to aid it—not directly, but indirectly we thought it might be of benefit to the county.

1061. There has been a proposal, has there not, in your district to join up certain contiguous counties with a view of starting something in the nature of an agricultural school?—There has been a suggestion that we should work with other counties, and we have always been very glad to do it.

1062. Nothing has resulted from that?—Nothing considerable at present, except that having got our school and laboratories at Chelmsford we have always welcomed pupils from other counties, and we have a small grant now from Herts with a view to their farmers benefiting by our analyses and reports and classes; and pupils are received from adjoining counties.

1063. You have already told us that the classes at Chelmsford have drawn one pupil at least from Middlesex?—Yes.

1064. Do you now say you have drawn pupils from Suffolk?—Yes, and from Herts.

1065. Do you take those pupils in on the same footing as your own pupils?—No; they pay £1 a week.

1066. (By the Chairman.) I understand that Mr. Goodchild's time is limited, and if you will allow him to be interposed now, we will continue with you presently?—Certainly.

Mr. T. GOODCHILD, Chairman of the Agricultural Sub-Committee of the Essex Education Committee, called and examined.

Mr T.
Goodchild.
2 May, 1907.

1067a

1067b

1067c

1067. (*By the Chairman.*) Will you give us your opinion on the work that is done by the Essex Education Committee?—With pleasure. I will put it as shortly and as concisely as possible. I approach this question from a different point of view, possibly, from Mr. Nicholas: I approach it as one who is very much interested in our work at Chelmsford, and as Chairman of the Agricultural Sub-Committee. I dare say some of the gentlemen connected with other counties would like some explanation of our Education Committee. It is divided into half a dozen sub-committees; one takes higher education, one agriculture, one is a visiting sub-committee, and so on. Our agricultural sub-committee is composed of 16 members, mostly interested in agricultural work. The control of the laboratories is in the hands of a sub-committee, which is a sort of offshoot of the Agricultural Committee. I am on it, and attend when I can. This sub-committee has control of the laboratories and the staff, and all the rest of the work which has to come up for supervision before our Agricultural Committee. You must recollect that Essex is rather a peculiarly situated county; it is not only a large agricultural county, but it is a tremendously large suburban county. Leaving out the West Ham Borough, which has nothing to do with us, with a quarter of a million inhabitants, we have, besides, some 600,000 Metropolitan people in our Administrative County of Essex, which all comes under one committee for higher education work; and though it is a poor county in some respects, the assessable value is so much that at the present moment a penny rate collects nearly £20,000 a year. Of course the elementary work in our big boroughs, of which we have several, is nothing to do with us; but in higher education work they are all as one—they all coalesce, and we are all represented. You quite appreciate the difficult position in which we and the rest of my party here are, who come from the borders of a county which is agriculturally agricultural and rural, being mixed up with a large body of gentlemen who are of the town, townly. Therefore we go very cautiously to work. We do not say that as finding fault. The suburban men are very liberal, and it is marvellous how smoothly we work together; and when you see the amount of money we spend, it does not look so large when you compare it with the large assessment and the amounts of money we have to spend for educational work. I would like to bring up several things I have noticed with regard to this work. You asked a question as to whether we had a farm. We do not have a farm, but in defending our grant of £100 for some years which we have contributed to the Department of Agriculture at Cambridge, which I have been very pleased to represent for some years in my own county, it has been my plea that what may be done on a farm in Essex is done by that University farm. Certain things we should like to see done ourselves are done there, and it saves the county of Essex the great expense of running a farm of their own. That £100, which I have had to defend to the best of my ability from the criticism of some of our town members, which is only natural, is that it would spare us as a county from going to great expense to maintain a farm of our own. I admit it would be very valuable if we had one, but it seems to me also it would be very expensive. We must not forget that the County of Essex has been very liberal, considering its association with the poor districts, when we have been allowed to spend £12,000 in building up a laboratory which I think none of us are ashamed of, and which will hold its own with any other in England, but we run to the expense of some £3,000 or £4,000 a year in maintaining it. Perhaps some of the members of this Committee might think that rather a big order; but, considering what we spend for other spheres of work, I do not think it at all out of the way, and we are going on gradually in a progressive way, as much as we can expect the ratepayers of Essex to support. Someone asked a question with regard to dairying work. We started by appointing Miss Matthews to the staff for dairying in the year 1893. Our course of instruction then was to go through all the rural parts of the county and hold classes and give demonstrations. We then fitted up a travelling dairy, and we did what we call all the elementary work—the spade work. We thought when we built the laboratory that it would be a good chance for discontinuing the travelling dairy and using the laboratory for dairy work. We thought afterwards that the students who came for a more advanced course

could go to Chelmsford, which they do at the present moment. Another thing which Miss Matthews takes up, which I do not think I have heard mentioned, is poultry, and when the dairy classes are not on at Chelmsford she has for several years past, in the course of the winter time, gone through the whole county of Essex giving poultry lectures, and I should think a great many parishes have had two or three courses—I believe many have had one—and she goes and holds these demonstrations at the larger villages and centres, and has classes of students, and visits those farms where she is requested to do so in the daytime when the lectures are not being held, to give her views with regard to the conditions under which poultry should be kept and managed with reference to sanitation, health, and all the rest of it. Miss Matthews takes those two things up, and she has a competent assistant with her, and they take the whole of the dairy instruction of the County of Essex, and also the poultry work as well. With regard to the experiments, possibly I may be able to speak from the practical point of view, as my sons and I are large farmers in North Essex. I think, myself, that they have been very helpful indeed. We have taken up cereals and roots, and different varieties of wheat; we are now doing barley; we have done oats; we have tried maize-growing and beet-growing, and shown the different forms of beet that Essex can grow, and a comparison with regard to the sugar they produced, as compared with what is grown on the continent. It is only the price of the sugar that has stopped us from going on with that further. We have taken maize and pea-growing and various other things. The accounts of those experiments are all in the books. If they are not in the books supplied to the Committee, I have no doubt Mr. Nicholas will be pleased to supply the Committee with the list of our experiments which have been conducted on a large scale in the last few years. With regard to these expeditions, the question was asked whether any information was gained. The expeditions went to Denmark and Holland, and Hungary, and Scotland, and we are going to the North of England this month. I think they certainly were very useful. I was not able to go myself, as my time is very fully occupied with one committee and another and public work, but I have sons who have gone to some of them, and as one expedition was made up partly of girls—I have a daughter who went some years ago to Denmark—and from those and others (because the members of the party were carefully selected by our committee in order to have members from all parts of the county, so as to give all the county an equal chance as far as we could) I know they not only brought back a great deal of information as to things to copy, but also as to a good many things which not to copy, and I am not at all certain that what they have learnt to avoid is not of as much value to them as what they have learnt to copy. I do not say that in any spirit of criticism at all. There are large estates in Hungary managed on Governmental principles, with thousands of acres where experiments are carried on, and stock rearing of valuable animals, and in the other countries they have seen the elaborate care that is taken of the poultry, and pigs, and cows, and they have learnt a vast number of things. In Holland they learnt that it was possible to keep their cows under much cleaner and more sanitary arrangements, and I am afraid some of them came home and were ashamed to see some of the hovels in which the cows are kept in the eastern counties—a thing I hope the next generation will not submit to. They found that the cows in Holland are better housed even than some of the agricultural population in some of our own counties. The question is, has any information been gleaned from these expeditions, and although, as I say, I have been too busy myself in public work, that I have not been able to go, I have done my best to see that practical men are sent, not for theoretical, but practical reasons, to see if they can reap knowledge which will be of benefit to their neighbours when they come home. In this way good has undoubtedly been done. Another question touched on was the number of students. I have not the least idea how many hundreds of students attend our course of lectures. It is not only what we do at Chelmsford or at Colchester, where I often look in myself, where we have these big attendances all through the winter, but it is at all the different lectures that we have in the county on horticulture, botany, and that sort of thing, and all our staff are at the disposal of the local committees. I do not know what other counties may do, but we manage things in Essex in our own way.

1067d

1067e

1067f

Mr. T.
Goodchild.

1067k

1067g

1067h

1067i

1067j

We have local advisory committees who carry out all our educational work under the central committee, and they have charge of the technical work and instruction, and we get local control and management of local classes, therefore, everything we undertake at local centres. Our staff instructors at Chelmsford are bound to give lectures when required. The result of that is that we have had all this information spread through the length and breadth of Essex. Our old technical committees, before the Act of 1902 came in, used to do this work for many years; we had those technical committees sitting for many years, and we tried to take great advantage of them. I organised with a local committee in my own district for many years a course of instruction to the farm labourers and all the people employed on the farm, and farmers and landlords and everybody who liked to attend, could attend. We had practical men to give lectures at those courses—for instance, we had a shepherd who came in his smock, and gave lectures as to what he knew; and we had people in the other lines who understood stock, and so on; and we had very big attendances at those places in the Colne Valley. One time we had a man for horses, then a man for cattle, for sheep, and pigs, and all the various stock. We had also classes for ploughing. I have seen 50 or 60 pairs of horses competing after they had been well taught by a competent staff of teachers. We found very great interest taken in those classes of instruction, and the result was that I never saw a greater improvement in my life than I did after our agricultural labourers had been to the classes. They took great interest in them, and they improved many of them from ordinary ploughmen into first-class ploughmen. We gave them a diploma. On the competition day there were prizes given, and diplomas given in the different subjects. The same thing happened with the stacking. There was a vast improvement. You gentlemen who may have seen the stacks in the old days, and the unkempt and the untidy way in which they were, can now see the great difference there is. And if you will only give agricultural labourers the chance of learning, they are anything but the class of men they are usually taken to be, and they will endeavour to excel in their own work as much as any other class of artisan in the country. Then the continuation classes were begun in the old technical committee days, and they are continued under the present Act, and in all the country villages where we can have a course of instruction, we have the continuation classes for boys. I do not know that I need go more into these other things. I think, with regard to the County of Essex, myself, speaking as chairman of the Agricultural Sub-Committee, and being very much interested in agriculture, and coming out of quite a rural district as I do—the Colne Valley district—that we are going on satisfactorily at the present moment. With regard to our education at Chelmsford, I do not say we are progressive or anti-progressive; but I think the fact that my brother farmers appreciate it and that the bulk of the farmers in Essex are interested in it, shows the great benefit of it, and I think they are all agreed that we should take up anything that is of practical utility and run it for all it is worth. I do not say I shall want to ask my committee for a larger proportion for agricultural work, but I should not be a bit ashamed to do so if there was going to be any advantage derived from it, and I think they would look at it just as favourably as if Essex were an entirely rural county, perhaps more so, because having more money to play with I think they would be quite prepared to assist us if we could see the chance of using it to advantage. I must say, before I conclude, that we are spending £3,000 or £4,000 a year, and we are deserving of a good big grant. I do not want to make any comparisons. I have written to headquarters about it once or twice; but when we find others who only take up one part of the work, whereas we take up all parts of the agricultural work as far as we can—you have had it put before you by Mr. Nicholas, and it is no use my pressing it again—I think we are deserving. We take every phase of the work at Chelmsford, and if there is anything left out, I have no doubt we should be prepared to do it; and I think, under those conditions, we really are entitled—I do not wish to use any stronger word—to a good donation yearly for the work we do. We try to have good men on the staff, and we have had some very good men on the staff. You know the history of those men who have left us—Mr. Dymond, who is now an Inspector of the Board of Education, and Mr. Houston, who is in Dublin—and we are trying to get the best men we can to take their places; and I do think, according to what I hear has been given to other institutions, that we are entitled to a full thousand a year as a help to the work we are doing at Chelmsford. I have plenty of other information if the Committee would like to ask anything with regard to the work. Mr. Nicholas has been able to supply you

with a lot of details that possibly he may know more about than I do. I give up as much time as I can to the meetings of these committees. I think my agricultural committee are a first-rate lot. They do all they can to support and to back up the work, and I am very pleased to come here and show this Committee what we have done and what we are intending to do, and at the same time not to forget to press our claim. I think I ought to acknowledge the great assistance we have had from the Agricultural Department at Cambridge. We have received very valuable assistance from them. I know our friends—Mr. Somerville and Mr. Middleton—who we have been happy to work with at Cambridge, and I do think Cambridge has been of the very greatest assistance to us, and has saved us from having to run at our own expense a farm of our own, and up to the present I do think it has answered practically all the requirements.

1069. You are of opinion that lectures to labourers would have a useful effect?—I am certain of it. I only speak of what I and my sons have been in the habit of attending at different places in the county, and those lectures I have attended, from the great interest that is taken in them, I am certain they have done a lot of good. Of course in connection with the labourers' work, prizes for ploughing or stacking or anything of that sort adds a little interest for them, and anything that involves a little competition where Englishmen are concerned, especially with the chance of a prize, even though it is not worth very much, at the end is an inducement, and the labourers are always keen to attend—at any rate they were in my district.

1070. As you have mentioned, Essex, as we know, is partly urban, so that I suppose secondary education is well supplied in the county; I mean, in the rural districts. Are there a sufficient number of secondary schools accessible to farmers' sons?—May I be allowed to expound without a simple yes or no? When we started our committee-work four years ago, we decided to have secondary schools all over Essex. We had Professor Sadler down and took his advice. Last week we opened our first mixed school, and this week we have opened another—a girls' school—and we are trying to have secondary schools for boys and girls separately where the population is large enough to admit of it. We are trying to give the whole of them an opportunity. In the Colne Valley, which is a very rural locality—I do not suppose anyone here has ever seen it except Professor Somerville and Professor Middleton—we have a secondary school for boys at Earls Colne, and we make a fairly liberal contribution to it from the county. We have a technical school at Halstead, one of the first in a rural district, where we give the town schools a certain proportion of the time and the other rural schools the remainder. It is both for boys and girls. The boys learn handicrafts and the girls cookery and all the different things. We are now buying a site to establish a secondary school for girls at Halstead. I give you those details to show what we are trying to do in that Colne Valley.

1071. The County Council have at present made liberal contributions?—Yes, very, very liberal indeed; they make a big contribution.

1072. (By Mr. Latham.) Can you tell us why the travelling dairy schools were stopped all over the county?—That is going back a good many years to the old technical committee days. We started them because there seemed to be a demand for them. Essex up to that time had never been considered capable of dairy work. Twenty years ago when Essex was blackened as derelict, a number of Scotchmen and men from Devonshire came into the county and started a new industry, keeping cows, and when we found that was the case and was successful, we thought it wise to give the labouring classes an opportunity of learning dairying work, and we appointed instructors. Miss Matthews, of Wales, was appointed, and she went round the whole county first to see if there was this demand, and she found that there were many farmers' daughters and others who were likely to be interested in work of this sort, and they came to these classes. The result of it was that it was very popular—it was as popular as anything I have ever known. They had good classes, and then they had a dairy travelling van to travel with the churns and apparatus and so on which travelled round the country, but that was a very expensive work, and when we built our laboratory we thought we had done all the elementary work, and that they could come to Chelmsford in future.

1073. Essex has had a great many farmers imported into it, has it not?—Yes, a great many Scotch and Devonshire farmers.

1074. That has virtually transformed the farming industry in the county?—Yes, especially on the north and

Mr. T. Goodchild. the south side : not so much on the north-east side and the west.

2 May, 1907. 1075. Farming in Essex has very much altered during the last few years ?—Yes ; a good deal of the land has been laid down to grass. It is not a grass soil—not a rich grass soil—but still after a certain number of years it grows a fair kind of grass, and, with cereals not paying for growing under the present order of things, people have taken to dairy farming and to supplying London with milk. That is done on a very large scale indeed, especially on the south side.

1076. Now you have got the dairying course at Chelmsford you get students to come ?—Yes, a great many do come.

1077. But it leaves a great part of the country not covered as it was with the travelling dairy school ?—Yes.

1078. We have not heard anything about the prices of the produce ?—They have been very satisfactory.

1079. Mr. Nicholas is coming back, and I will leave that question to him. With regard to elementary teachers, I have never been able to find out what you teach them ?—They go from the different parts of the county and have their classes on the Saturday when they are not at school. Nature studies they go in for a great deal, and ramble studies, and they learn a great deal of botany. Mr. Nicholas will be able to tell you all about that. Being in the farming line myself, I have not been able to get all these details.

1080. Possibly you are one of the Board of Agriculture Correspondents, the same as I am, and consequently have a great number of useful leaflets sent to you ?—My son is one of their correspondents.

1081. Are the leaflets sent out by the Board of Agriculture made use of by teachers ?—There is such a lot of literature sent out broadcast in this country, that I am sorry to say I think a great deal of it finds its way into the waste paper basket ; but if you will allow me I will ascertain definitely on that point, and send you that information if you will give me your address.

1082. My name is Latham ?—Oh yes, I meant if you will let me know where to send the information to.

1083. There is my card. (*Same handed to the witness.*) I would like to know what sort of attendance you get at your lectures ?—I have been attending the Colchester lectures chiefly. From about 50 or 60, the smallest, up to about 120. I should think the classes average very nearly 100, and they are attended by all the best farmers on that side of Essex.

1084. Are those lectures attended principally by the fresh number of men that have come into Essex ?—All classes attend, but there is nothing like the number of fresh men in my district ; you must go up more into Mr. Steel's country, Southend and Rochford, for them. Of course there are around us little batches of them, but nothing like the tremendous lot they have got round Southend and the centre of the county.

1085. They do take a very great interest in it ?—Yes, all the best of them, men like John Eagle, are in the habit of attending them in their own district.

1086. You do not do anything towards teaching your labourers as to the construction of the machinery and slight repairs to machinery ; is not that a very useful thing ?—After we got into the tremendous expense we did two years ago, as a result of the 1902 Act, and found what we were spending on education, the chairman appealed to us to draw in our horns as far as we could for a year or two, until we knew where we were, and, although I have always pushed technical education to the best of my ability, I have tried as much as I can not to spend any more money for fresh work until we could find out how we stood exactly.

1087. Do you not teach horse shoeing ?—Yes, we had classes for one or two years, and blacksmiths used to come from different centres and take their degrees. In fact, some of them have them up over their doors at the present moment. It did a lot of good. We found there were plenty of people who came to attend things of the sort and got a lot of advantage from it.

1088. Mr. Nicholas spoke about placing the young students back on the farms with their fathers or others ?—You mean the ones that attend the courses at Chelmsford ?

1089. Yes ?—Of course the class of boys who go there are boys who have just left their schools, a good many of them about 15 or 16, and they have gone to those courses for perhaps one or two years, and at that receptive age they do gather a lot of information, and I only wish that I had had the opportunity that my boys have had who have been to Chelmsford.

1090. (*By Mr. Davies.*) How does your Agricultural Committee keep in touch with the other localities in the county ; what machinery have you for arranging lectures, and so on ?—Through our advisory committees. Every year we ask the advisory committees to prepare a scheme for higher education, including work for agricultural experiments and that sort of thing, and they send up schemes asking that a certain lecturer may come and hold a course of lectures on such and such a subject ; others on orchards and gardens, or whatever it may be. That is accepted by the higher committees and it is charged against that particular district. Our suburban friends do not let all this go in ; it is charged and ear-marked against the particular district that asks for that particular instruction.

1091. How are the advisory committees appointed ?—They are nominated on this principle. We establish them on the union area. We thought there was nothing like the union area from the point of view of what work you do get done, and we went on that system in Essex. All the committees are convened once in three years to elect the committee, and they select, as near as they can, the members of the advisory committee, almost like a District Council, to represent all sorts and conditions of men and women of all politics and all religions. That is how our advisory committees have been appointed, and they manage the whole of their areas. We have local self-government, as it were, as far as we can get it, and we hope to keep it.

1092. Do you help the students who take the short courses ?—Some of them we pay the railway fares for, and up to lately we have been paying a maintenance allowance for those who get the scholarships and go to Chelmsford—that is up to the last six months. We pay the railway fares for the agricultural students.

1093. And they board themselves ?—Yes, but it does not cost them very much.

1094. Do they go in for the National Diploma in Agriculture Examination ?—We generally have an examiner from the Department of Agriculture at Cambridge. They generally send somebody down to examine our students, but I cannot answer that question.

1095. (*By Mr. Latham.*) You have said a great deal about farmers' excursions to the Continent and different places. Is there any attempt made to distribute that information after they come back ?—Yes, an account of it is drawn up, and we always send the man who has been in charge of the tours round the county the following winter and hold meetings, and he goes there with diagrams and shows them all that they have done, and there are nearly always several amongst the audience who have been on those expeditions, and they dot the "i's" and cross the t's," and the rest of the people round have an opportunity of trying to learn as much as possible.

Mr. GEORGE RABY, called and examined.

Mr. G. Raby.

1096a

1096. (*By the Chairman.*) I will simply ask you, Mr. Raby, to mention any supplementary facts that you have to add to the evidence that Mr. Goodchild has just given us ?—The ground has been so amply covered by Mr. Goodchild that I do not think I can add very much to what has been already said. My individual opinion would be that our course for the winter school of agriculture is not long enough to cover the whole curriculum that we teach there, and I think it would be a very great advantage

if we could extend that course. With regard to the local classes, there is no question in my mind that they have had a very good effect on the labourers in the county—these classes for ploughing and stacking, and thatching, and hedging. In my district they have been exceedingly well attended, and there has been a very keen competition at the finish. I cannot agree with what Mr. Goodchild said just now about the hovels in which the cows are kept in Essex. There has been a very marked improvement there

1096b

in recent years. In some districts to my knowledge there are competitions in vogue for the best kept cows and the cleanest cow-houses in certain districts of the county.

1097. Would you explain about these local committees. Do I understand that in every union there is a local advisory committee formed?—Yes.

1098. Would you explain how it is selected and appointed?—The members of the County Council living in the union district nominate a certain number, I think it is about 15, and they submit those names to the central committee, and they either approve or add to them as they think fit.

1099. To the central committee?—Yes, to the central education committee.

1100. And they formulate any scheme which they think would be of advantage to the district. A scheme is formulated by the local committee and submitted to the general committee, and sent by the general committee to the sub-committee?—Yes, that is so, so far as they would relate to agriculture.

1101. The lectures which are given in that area under that local committee are paid for out of the funds locally provided?—That is so, except as regards those lectures given by the staff from the laboratories, which are county charges.

1102. The cost of the others do not come out of the general fund?—No.

1103. How are these funds raised?—By the higher education rate, the 1d. rate, plus the amount allocated out of the "whisky money" to that particular district.

1104. I thought that the penny rate was over the whole county?—That is so.

1105. Is there in addition a local rate for these purposes?—No, not in addition to the penny rate.

1106. Then it is taken out of the contribution of the penny rate of that union?—Yes.

1107. By the central committee?—Yes.

1108. (*By Lord Barnard.*) You are engaged in farming yourself?—I am.

1109. And have been, I suppose, for many years in the county of Essex?—Yes, over 20 years.

1110. You are probably in constant touch with farmers and meet them and know their opinions?—Yes, daily.

1111. Do they all share your views that the system adopted in the county for giving agricultural instruction is a real advantage to the farming classes generally?—I think that is proved by the greater amount of use that is made of it every year.

1112. Are you yourself of opinion that it has resulted in direct practical improvements in farming operations?—Undoubtedly, in my opinion.

1113. I do not know that it is a question to ask you because there are sure to be critics, but do you know of any particular line of criticism that has been put forward—any objections?—No; I do not think I do. I think it is generally admitted that the work done in the agricultural department of Chelmsford is very useful and very practical work, and I think everyone will agree as to the advantage of it.

1114. In the county is there any of that local feeling, which almost always exists in all counties, induced by local attempts to get advantages for special districts?—I do not quite follow.

1115. Does any particular district in the county ever obtain advantages which are not extended to other districts in the county?—No, I think not. The local advisory committee send in their schemes—any scheme that they think would be of benefit to that particular locality they send in—and I think they are all fairly considered by the central committee. If you refer to the agricultural analyses you will see how that is appreciated in the county. It is going up by leaps and bounds.

1116. (*By Dr. Somerville.*) Have you yourself taken a personal and practical interest in the classes for labourers in hedge-cutting and ditching and thatching, and so forth?—Yes, in my own district.

1117. I suppose a considerable amount of systematic instruction precedes the examination?—Yes, that is a condition precedent to giving any reward or prize.

1118. Do the ploughmen, for example, assemble on one particular farm where the instructor is giving his demonstrations?—Yes, we have these lessons given by an experienced ploughman in perhaps an area which would

cover two parishes or three parishes where the young people could easily get there of an evening. It is generally about this time of the year in May, when the evenings are getting longer.

1119. So that the instruction is given after ordinary working hours?—That is so.

1120. I suppose that some farmer lends his farm to the instructor?—That is so, and also team and plough.

1121. There is no difficulty in getting farmers to give such facilities?—Not the slightest.

1122. In no case I suppose that you know of is the instruction given during working hours?—I have never heard of it.

1123. How many lessons comprise the course?—Twelve.

1124. There are always prizes given as the result of the competition?—Yes, and of course one of the conditions is that the requisite number of attendances at the classes must be made.

1125. (*By Mr. Staveley-Hill.*) How long have these classes of instruction for labourers been in existence?—For several years.

1126. Do you find that as time goes on the numbers of labourers attending the instruction and afterwards the examination increases?—I think they have tended to stimulate the art of ploughing, for instance, in every district.

1127. Yes, but do the number of labourers who attend, and who are mostly young men, I presume, increase?—I think they are about the same as when we started.

1128. They have not increased?—No, but the classes are held at rather closer centres now. There are more of them in the county now.

1129. How many do you have at one centre in the course of a year?—By a centre do you mean one local advisory district?

1130. Yes?—I dare say there would be six or seven centres in a district. It would have to be get-at-able, because these men cannot walk far from their work when they are finished.

1131. (*By Mr. Middleton.*) How many instructors have you got in the county of Essex?—We pick out the best man we can find.

1132. Each advisory committee selects its own man?—Yes.

1133. He is selected because of his skill, I suppose?—Yes, they generally get a local reputation for skill, and those are the men who draw the young men to the classes, whereas a stranger would not do so.

1134. Can you give an idea as to how many attend the classes of this sort in your neighbourhood?—I should say an average of about 10.

1135. How long do the classes last in the evenings—about two hours?—Yes, about two hours, perhaps rather more sometimes.

1136. Has your experience like Mr. Goodchild's, been that the ploughing classes have been more successful than those of the stacking and thatching?—I think perhaps that they have, but I am not going to say that the stacking and thatching classes have not been a success.

1137. You think they also have been successful?—Yes.

1138. I suppose you get the best men for thatching and stacking that you can get in the neighbourhood?—It is a very difficult matter to give instruction in stacking. In my locality we give prizes for the best made stack; it is a competition really in the case of the stacking.

1139. You do not actually give instruction in that?—No, we cannot really give instruction in stacking.

1140. How do you manage in hedging. Is that by competition or do you give instruction in hedging?—No, we have an instructor in our district. We had a man from Warwickshire. He was in the district I should think for six weeks and that led up to a competition.

1141. (*By Mr. Latham.*) Nearly every question has been asked you by Mr. Middleton that I was going to ask. I presume you have ploughing matches all over Essex, do you not?—Yes, they are growing very fast in number.

1142. And if a man takes the champion prize one year he is very often offered the instructorship the next, I suppose?—Yes, that would be so usually.

1143. Do you give any instruction to shepherds and that sort of thing?—Not in my district.

Mr.
G. Raby.
2 May, 1907.

Mr. G. Raby. 1144. Do you give any education in shearing, and prizes for shearing?—Not to my knowledge.

May, 1907. 1145. I suppose there is not such a large number of sheep kept?—No, except on the Suffolk border.

1146. Is there any education given in the feeding of cattle?—In the Winter School of Agriculture.

1147. Is it given to the men themselves?—No.

1148. That is a very important thing, is it not?—Yes, and a very difficult thing to teach I should think.

1149. I quite agree. Many men could feed animals as well with half the food that another man would give them. It is a thing which is sadly neglected in a county like your own?—Yes.

1150. (*By Mr. Davies.*) With regard to the diffusion of literature, have you got any machinery for doing that, or letting the farmers know what the results of experiments have been in the county, or do they have to apply themselves if they want any literature on the subject?—

think we had a thousand copies of those books containing the results of our experiments printed.

1151. And you distributed those?—Yes.

1152. Without making any charge for them?—Without making any charge for them.

1153. Have you any agricultural libraries in the county?—We have a very good library at the technical laboratory.

1154. No branch libraries in the district?—No.

1155. (*By Mr. Medd.*) Have any of the village teachers in your neighbourhood attended any of these classes for teachers?—Yes, many.

1156. And also the Saturday rambles?—Yes.

1157. Have they given instruction in their school gardens?—Yes; school gardens are springing up all over the county, too.

1158. I suppose the parents value it?—There has not been much time to judge of that yet.

1159. You yourself, as a practical farmer, think that the teacher has very much improved?—Undoubtedly.

Mr. ALEC STEEL, called and examined.

*Mr.
A. Steel.*

1160. (*By the Chairman.*) Would you give your opinion to the Committee on the success of the work of the Essex Education Committee?—I think everything I have to say has been pretty well covered. I do not think it is any use my making a statement because I should only repeat what has already been said, and that would be lost time.

1161. (*By Professor Middleton.*) You have been long associated with this work, have you not?—Yes.

1162. For how many years have you been associated with the work of the Technical Committee?—From nearly the beginning of the old technical committee.

1163. What, in your experience, is the part of the work that has most attracted the farmer?—The analytical work.

1164. I do not quite understand how analytical work is done in the county of Essex. Mr. Nicholas said that no commercial work was done?—Yes; that is quite true so far as the regulations are concerned.

1165. That is to say then that analyses are only done for farmers who are prepared to use them experimentally?—I am afraid that the ground that is covered is much broader than that.

1166. In what way. Do they supply practically all the manures which are brought in for analysis?—Yes, farmers take pretty good advantage of the laboratories for having analyses of their manures and feeding stuffs.

1167. You think in the county of Essex, generally, farmers take a great deal of trouble to ascertain the character of the manures and the feeding stuffs which they buy?—They are taking more and more care every year.

1168. A statement went the round of the papers some time ago—I forget the origin of it but I believe it was based upon the report of the county analyst—that a very small number of analyses had been submitted to the county analyst during the year, and the papers were pointing out that Essex farmers were not making use of the analyst to determine the value of their manures and feeding stuffs. That is not your opinion?—I take it that you mean the analyst appointed under the Fertilisers and Feeding Stuffs Act.

1169. Yes, the report in the newspapers was based upon that?—It has been rather a dead letter from the beginning.

1170. The point I wanted to bring out was that the farmers in Essex, as a matter of fact, are very much alive to the necessity of getting the manures and feeding stuffs analysed?—Very much alive.

1171. That is just the opposite of the statement that went the round of the papers?—Yes. During this year for the nine months ending in April, the number of analyses done at the Chelmsford laboratories was 509. In 1896, the number during the year was 21, and every year, with the exception of one year, the number of analyses have increased very much, in fact during the last two years the staff has hardly been able to cope with the work

they have had to do, and we have had to wait some time before the returns have come back.

1172. Have you in your district had instruction given in ploughing and thatching?—We have had classes for about two years.

1173. About what number usually attend?—About a score.

1174. Do they last for about the same time as Mr. Raby mentioned—about two hours?—Yes.

1175. In the evening?—In the evening.

1176. And twelve lessons?—Twelve lessons.

1177. (*By Mr. Latlam.*) May I ask if you are a farmer?—I am.

1178. With the better management of the farms do you find that rural depopulation goes on with you the same as it does with other counties?—No, not much with us.

1179. May we take it for granted that all these extra things you are giving to the agricultural labourer is taken advantage of and shows that if it was taken up more widely they would stop on the land?—I consider that is greatly an economic question. We pay wages equal to what are paid in the towns, and in consequence we have no trouble in getting plenty of labour.

1180. Does that apply generally to Essex?—The wages in the agricultural districts generally are under the wages paid in the towns, but in our district we pay as high wages as in the towns, and we have no trouble in getting labour.

1181. May I ask you what the wages are in Essex?—Taking the county generally they are about 14s. or 15s. a week for a horseman, and about the same for a labourer; the horseman has a cottage along with that and the labourer has not, and then there are extras for the harvest and hay.

1182. Do not the people in the towns get more than that?—Yes.

1183. Then they are not so equally balanced?—I said in my locality. We pay an average of 22s. to 23s. a week in wages, and that is quite equal to what they get in the towns.

1184. You made a remark just now that I was sorry to hear, that the Fertilisers Act has always been a dead letter?—It has always been more or less.

1185. Can you tell us why that is?—Yes, I can. I have here a copy of some of the analyses made at the laboratories in Chelmsford, and I should like to read you just one or two of them, and they will explain themselves. This is a sample of linseed cake, and after the analysis is given this is put at the finish: "This sample contains a low percentage of oil, but a high percentage of albuminoids. It is not quite pure, and contains a slight amount of starchy impurities. This is brought out in the analysis by the high amount of soluble carbohydrates. The linseed cakes we have examined this year have a lower feeding value than last year, and contain as a rule less albuminoids and a higher amount of soluble carbohydrates. This sample compares well with them in feeding value, and is worth,

taking the food units of linseed cake at 1s. 3d., £8 10s. per ton." That sample was analysed at the laboratory at Chelmsford, and those explanatory remarks were made at the end of the analysis. I have three or four similar ones. Now I will read you one under the Act. There is no statement given of the quantity of fats or other solids, simply this:—"I am of opinion that this is a sample of genuine milk." That explains the whole matter in a nutshell.

1186. (*By Lord Barnard.*) As you have touched upon a subject which I asked Mr. Nicholas, I would like to ask you a question. I am not sure that your evidence agrees. I suppose you are aware of the regulation of your county

that: "All such analyses and reports are for *bona fide* agricultural purposes only; they must not be used commercially, nor for trade purposes. All samples must be carriage paid, and the fee must be sent with the sample. The Committee do not undertake analyses of fertilisers and feeding stuffs under the provisions of the Fertilisers and Feeding Stuffs Act. Such analyses can be obtained from the District Analyst appointed by the County Council." Practically those regulations are a dead letter as I gather?—They are to a certain extent.

1187. You have given the reason why?—Yes.

Mr.
A. Steel.
2 May, 1907.

Mr. J. H. NICHOLAS, recalled and further examined.

1188. (*By Mr. Middleton.*) The first question I wanted to ask you is with regard to what Mr. Raby alluded to about the analytical work. That has been explained to us. You do a very large amount of that work?—Yes, and I could have read a similar letter to you to the one that Mr. Steel read just now, only more fully, showing the style of work that is done there.

1189. I gather the difference between the two analyses is that the analysis made at Chelmsford ends off with some advice to the farmer?—Yes, it is of economical value.

1190. With regard to your staff at Chelmsford, you told us that you were particularly successful in getting together a very good staff to begin with?—Yes.

1191. That very largely accounts for the success of your institution?—Undoubtedly.

1192. Have you found difficulty in retaining your staff?—Yes, we have. When we have good men everyone tries to get them. We have lost Mr. Dymond and we have lost another recently. I hope we shall fill their places successfully.

1193. You do not appreciate any difficulty at your present standard of salaries—that is really what I am coming to. When you were asked how you would use further grants you indicated developing and extending other centres in the county. I was wondering whether there was any other direction in which you might do yourselves good?—Yes, I think we could. If you want good men and wish to keep them you must pay them and pay them well, and we have done that in our county, and to keep a really efficient staff I am not sure that we shall not have to make an increased expenditure in the near future with that end in view.

1194. You consider you may have to increase your expenditure in that respect?—I do.

1195. I think we may take it, perhaps, that the keynote of the success of your work in Essex is that you have all along carried the farmers with you and interested them in the work?—That is so.

1196. Do you think the presence of an urban population has had any influence upon the farming population?—Yes, I think it has had an influence for good. From my experience of the men from the urban districts on our Committee I can say that they have always been particularly helpful in initiating and settling our schemes and work sympathetically with the members of the Agricultural Sub-Committee, and they have certainly always given us great help in making suitable appointments on our laboratory staff. We have had no rivalry or jealousy or unpleasantness of any description with them.

1197. They have given a certain amount of stimulus to the rural population?—Yes, that is so.

1198. (*By Mr. Latham.*) Could you assist us by giving us the prices that you have obtained for the produce that you have made in your dairy?—I am afraid we have not made any profits. Do you refer to the cheese?

1199. Yes?—It varied as a rule. For Cheddar it was about 8d. a lb., and it ran up to, for Stilton, 1s. 3d. a lb.

1200. That is very good indeed. I think it was you that mentioned the large amount of milk analyses that you had had sent in?—Yes.

1201. Could you give us any return of them?—The analyses in 1897, for instance, were for feeding stuffs 4, for manures 13, soils 1, water 6, milks 5, total 29. In 1905-6, which is nearly 10 years afterwards, there were 74 feeding stuffs, 54 manures, 23 soils, 21 waters, 272 milks,

10 miscellaneous, a total of 454. Of those for Hertfordshire there were 48 in 1897, and in 1906-7 there were 104.

1202. You are Secretary of the Education Committee of your county, are you not?—Yes.

1203. Can you tell me why the Fertilisers Act has not been put in force by the Committee?—It is put in force by the Committee. They have appointed an analyst under the Act and they pay him the regulation fee.

1204. Yet even now it will not work?—No, it does not work.

1205. Is there any great pressure put upon the county to try and make it work?—I think there is no pressure put one way or the other; the people simply go where they wish to go.

1206. And having such a good friend in you?—In the committee if you please.

1207. Yes—they come to you?—The point is that our Committee is closely in touch with the farmers. The farmers know what can be done, and they know they will get advice. That is really the point of the whole thing, and in the other case they cannot.

1208. Would you explain to us about the weekly meeting of gardeners. I could not quite gather what that was?—They are weekly meetings of gardeners for discussion and self-improvement, at which addresses are given and discussions take place respecting gardening operations—it may be in trenching or particular kinds of flowers or different kinds of fruits or fruit trees and dealings with fruit trees—all kinds of subjects dealing with gardens. One subject is taken each evening, and the men are chiefly instrumental in improving themselves with the help of our staff.

1209. With the help of your staff—that is exactly what I wanted to know?—Yes.

1210. They do not attempt to teach each other without your assistance?—They teach each other through the discussion, but the staff are there to give them help and lead the men.

1211. You seem to have great power on your County Council. Do they delegate the whole of their power to the committees?—Yes, except the power of raising a rate or borrowing money—that is protected under the Act of Parliament. But they delegate all the powers they can to the committee.

1212. And you delegate your powers to the Agricultural Committee?—No, we do not delegate anything after that; they simply act as advisory committees and carry out certain agreed-upon work.

1213. The Agricultural Committee comes back again to the education committee?—That is so, but we have no difficulty with regard to that.

1214. (*By Mr. Medd.*) You could not say off-hand the cost of establishing, equipping and maintaining winter schools of agriculture in your county, could you?—No. I could tell you the cost of our present school. I should be very glad to send you a rough estimate of what it would cost later on.

1215. Thank you—the cost of establishing, equipping and maintaining the schools of agriculture and horticulture, and then, perhaps you could kindly send a diagram of the county school garden, illustrating the manner in which it is laid out and the cost?—With pleasure.

1216. Could you describe the social status of the pupils

Mr. J. H.
Nicholas.

Mr. J. H.
Nicholas.
2 May, 1907.

who attend?—Yes: I will give you particulars of each one for both schools, with pleasure.

1217. In regard to the school Saturday rambles there was a little correspondence in *The Times* a year or two ago implying that there might be some risk to plants, by the destruction of plants and so on through those rambles. I imagine you have not experienced anything of the kind?—No. I went down with the party in question, it was in the New Forest, and there was not the slightest ground for such a suggestion.

1218. The rambles tend to increase, do they not?—Yes, they increase very much.

1219. Of course you get all the assistance for which you ask in the way of advice and so forth from the Board of Agriculture?—We do.

1220. Does the Board of Agriculture ever spontaneously offer advice or suggestions?—No.

1221. It does not come to you in any advisory capacity unless you go to it?—No. I believe they send out leaflets and pamphlets and things of that kind, but not otherwise.

1222. You do not come in contact with them except on your own initiative?—No.

1223. With regard to the Board of Agriculture Correspondents, do you get any benefit as an educational authority or as an agricultural authority from them *qua* correspondents?—I do not understand—correspondents?

1224. The official correspondents nominated by the Board of Agriculture in each district. Do they come into connection with you?—No.

1225. You employ them to some extent?—No. I have no knowledge of them.

1226. Reference was made to the school at Bigods. With that school you, as a County Council, have no connection, have you?—We have at the present time.

1227. You have now?—Yes: we gave them a grant of £100 a year but there has always been some uncertainty about the school at Bigods in regard to our county, and when the Board of Education withdrew their recognition we felt we could not continue ours, and then we withdrew our grant. Since then it has passed to the Technological Branch of the Board of Education, and they have recognised it as a technical day school, and, since that has been done subject to a recommendation being made, we shall probably aid it again.

1228. You are not aware of a school of a similar type in England to Bigods, are you?—No, I cannot say I am.

1229. There is one in Scotland at Goldspie; that is the only one. To go back to types of schools, on any of these excursions abroad, in Denmark or Holland, did you notice any particular type of school or form of instruction there which, if you had means, you would introduce in Essex?—I think we should develop very much on the lines we have—it would probably be more of a national matter, the provision of the very large establishments that you find in Hungary, for instance—the great central institutions they have there for agriculture, taking a three or four years' course—those would be beyond the powers of individual counties.

1230. You did not visit France, did you?—Not with the party.

1231. To some extent you do in your county what the Dutch do with their winter schools?—Yes.

1232. (*By Prof. Middleton.*) Would you tell us the cost of providing instruction in ploughing, hedging, thatching and so on. I should like to know the cost of instruction in ploughing, hedging and thatching in particular districts, and any other art that you teach?—I will send you that, with pleasure.

1233. (*By Dr. Somerville.*) These figures of analyses that you gave us were for the year 1905-6, were they not?—They were.

1234. Is that the last return you have available?—No; I have 1906-7, from July to April.

1235. How many analyses of milk does that include?—For that part of the year 256.

1236. Is that an increase on the previous six months?—Undoubtedly it would be, in proportion.

1237. Does that include the figures that were got under the cheap milk testing scheme?—Yes.

1238. Can you tell me whether that scheme is being taken advantage of to any considerable extent?—Yes, I think it encourages people to take systematic tests and send in regularly.

1239. You think that that test formulated by the Board of Agriculture has been much appreciated?—Yes, much appreciated; it leads to other things.

Mr. T. J. YOUNG, F.S.I., called and examined.

Mr.
T. J. Young.

1240. (*By the Chairman.*) You are the Principal of the Agricultural College at Holmes Chapel, Cheshire?—I am.

1241. Will you give the Committee a short review of the history and development of that college?—It opened for work on the 23rd September, 1895. If you wish to have the number of students in residence I could give you that for each year since that time.

1242. If you please?—For the year 1895-96, 93; 1896-7, 120; 1897-8, 145; 1898-9, 110; 1899-1900, 115; 1900-1, 103; 1901-2, 123; 1902-3, 143; 1903-4, 125; 1904-5, 125; 1905-6, 123; 1906-7, 130.

1243. To what class do those students belong?—At the present time there are 16 sons of farmers; eight sons of landowners and land agents; five are sons of retired farmers; three sons of merchants; three sons of accountants; two sons of engineers; two sons of secretaries; one son of a schoolmaster; and one son of a stockbroker. There are 41 in residence at the present time; that is rather smaller than previously, but we have rather gone to try to reduce the number of students and are endeavouring to get better class ones.

1244. (*By Mr. Latham.*) Would you give us the total number of students you have had?—1,455.

1245. In how many years is that—since 1895?—Yes, twelve years, an average of about 125.

1246. (*By the Chairman.*) Will you give us the courses of study?—There is only really one course, that is the diploma course. We do not split up our course of study except so far as we divide the courses into a horticultural one and an agricultural one. The horticultural students do not take a great many of the subjects such as agriculture and veterinary hygiene, like the agricultural students do; they take subjects like biology, botany and chemistry.

1247. Do the students follow the same course?—Yes, except that some take up horticulture and some agriculture; we have no short courses or special courses.

1248. What is your staff?—I have a staff of 11 at present: myself as principal and lecturer in agriculture and estate management, a vice-principal and lecturer in agricultural chemistry, one lecturer in surveying and engineering, one in biology, one in veterinary hygiene, one in horticulture, one in dairying, two laboratory demonstrators, one instructor for school gardens in the county, and one instructor in drawing and engineering.

1249. Have you a farm attached to the college?—Yes, a farm of 100 acres.

1250. Managed by yourself?—Yes, I manage the farm myself.

1251. That is in the immediate neighbourhood of the college?—The college stands in the centre of the farm, and we have seven acres of garden.

1252. Do you conduct stock-breeding experiments there?—Not to any large extent. We make a speciality of breeding good dairy cows, and especially pedigree bulls from known milking strains; we keep a herd of dairy shorthorns.

1253. Dairying, of course, is a very important industry in Cheshire?—It is very important. I ought to say that dairying is taught specially at another institute under the Cheshire County Council for women only; ours is for men, but we do not go into cheese-making so deeply as they do at the institute that is provided. That is for women only.

Mr.
T. J. Young.
2 May, 1907.

1254a. 1254. What type of work conducted by your College is of the most value in your opinion?—I think a carefully carried out internal course is one that seems to be appreciated by the students; at any rate we have more applications than we can deal with. We are having to enlarge the buildings a second time in order to provide accommodation for additional students. I think also the outside work in the way of experimental stations would be very useful if we had an extra man on the staff. I am hoping to advise my governing body to provide a man whose business it will be to go about and manage those experimental stations in the county, and hear what the farmers want, and then endeavour to answer their questions.

1255. Are there any centres in the county where experiments are conducted?—We have eleven experimental centres.

1256. Under your control?—Under the control of the college, but the number of those experimental plots might be increased with advantage, I think.

1257. That is what you consider the most urgent need?—Yes, I think it would still further bring us into touch with the farming community. At present our staff are a little overworked, and have not time to devote to the outside work and research as much as we should like to do. We could manage the internal work, but I think we want a man for the external work.

1258. Then with regard to the expenditure of the institution, perhaps you will give us the details of that?—Our total expenditure for the last three years has been, in the year 1904-5, £5,880 4s. 1d.; in the year 1905-6 it has been £6,873; of that there was £1,366 invested in new fitting up and buildings; and last year, although our accounts are not closed for the financial year, it is approximately £5,168.

1259. What are your sources of income?—Students' fees, sales from the farm and garden, and the grant from the Board of Agriculture; also a certain number, varying each year, of scholarships from the Cheshire County Council.

1260. Does the County Council in addition give a grant?—The County Council in addition give a grant—as a matter of fact it makes up the deficit.

1261. They accept the responsibility for any balance that may be due?—Yes, they accept the responsibility for that. I might say that this balance has been considerably larger the last three years. We have had to do a great deal to the place and make it fit to carry out a better and more useful class of work.

1262. How is the committee constituted which controls the institution?—Mainly by members of the Cheshire County Council. There are other co-opted members representing different agricultural interests.

1263. Is there an Agricultural Sub-Committee of the County Council?—Yes, there is an Agricultural Sub-Committee, and all of those are on it.

1264. Have the County Council delegated to the Education Committee ample power of dealing with the college?—The Agricultural Sub-Committee have full powers of control over the place.

1265. What is the attitude of the agriculturists in the county towards your work?—Pretty good; I might say they are favourable. I should say, speaking roughly, that quite 1,000 farmers visit the college in the course of every summer; that will be under the mark rather than over it.

1266. In what type of work does the agriculturist take most interest?—I daresay most of all in the variety trials of crops. Perhaps that is what he takes interest in more than anything else; that is what seems to attract them very largely, and the different manurial experiments. I think the college farm, taken as a whole, interests them more than anything else.

1267. Is it the larger farmer or the smaller farmer who takes most interest in your work?—I cannot say that I see any difference; I think they are both alike. The smaller men perhaps take more interest in the poultry keeping and calf rearing, and perhaps the larger men take interest in other things, such as potato growing; but we have as many on one side as the other, I should say.

1268. They both send their sons to the college?—Yes.

1269. Do the neighbouring counties in any way contribute?—No; we are entirely by ourselves.

1270. Higher fees, I suppose, are charged for those students coming from other counties?—Rather higher fees are charged from other counties, yes.

1271. What is the general scheme of field experiments that you have adopted?—I do not know that we have a

very definite scheme; it varies from time to time. Our variety trials of all sorts of crops are the chief thing. We are often asked to try something by a farmer or a farmer's club specially, and we do that work for them, but we have no settled scheme.

1272. Are local lectures provided throughout the county?—No; we do not do as much of that as we should like to be able to do.

1273. That is more a question of expenditure?—No; that is a question of the staff being overworked at present, but when we get a little easier we hope to be able to devote some more time to lectures.

1274. Do you think they will be well attended?—Yes, I think so. Our horticultural lecturer has had a very successful experience in his lectures; he has covered almost the whole of the county and given lectures, and has had large attendances.

1275. Attended mainly by gardeners, I suppose?—Yes, mainly perhaps.

1276. Do you give information on any subject, or any analyses that may be required by farmers?—Yes; that branch of our work has increased enormously.

1277. During the last two years?—Yes; the demand for information on specific points. Two years ago, I think, there were only eight applications sent in to the college for advice, and in the year 1905-6 we had 211 separate enquiries from farmers—chiefly seed, drinking water, milk, manures, food-stuffs and animal and plant diseases, and I see that during the past two months we have had 38 examinations and reports for farmers during the months of March and April. It is practically every day that we are doing that sort of work; it has grown more than any other part.

1278. Does that include analyses of manures and food-stuffs?—Yes, food-stuffs, samples of milk, drinking water, and plant and animal diseases of all descriptions.

1279. And soils?—And soils.

1280. Is any special provision made for training teachers?—Rural school teachers?

1281. I do not mean elementary teachers, I mean teachers in agricultural subjects?—I think, roughly speaking, half-a-dozen of those who have been through the college are at present in teaching posts.

1282. Do they go to a university afterwards?—Yes; they usually take a university degree although some have not done so.

1283. Do they obtain a scholarship for that purpose?—No; I think they have mostly done it at their own expense.

1284. What do you do as regards elementary teachers?—We are endeavouring to have a summer course this year for them.

1285. For the first time?—No. Previous to my having charge there were some Saturday short courses for rural teachers, but we hope to have a vacation course this summer especially with regard to the horticultural side of the subject.

1286. Do you endeavour to induce sons of farmers to come to the college; is anything done to attract them?—I think it is well enough known. I think so far as Cheshire goes, those who want to come come and, of course, most of them have the advantage of a scholarship.

1287. You have, I believe, already stated that there is no difficulty in obtaining more money from the County Council?—Yes, I think there is; they have made themselves, I think I said, responsible for the deficit, but they feel they have spent as much as they are warranted in spending, and they do not wish to spend more.

1288. Is there a rate for educational purposes?—Yes.

1289. A penny rate?—I should not like to say what it was, but there is a rate for educational purposes.

1290. Of course you would wish the grant from the Board of Agriculture to be increased?—We do hope that it will be, seeing that we have altered the style of work altogether and reorganised the place and put it on different lines.

1291. Specially for enlarging the staff?—Yes. I think an additional member of the staff to do outside work would be very valuable.

1292. Is the preparatory training of your students very satisfactory?—No; I think as a rule they are very deficient

Mr.
T. J. Young.
2 May, 1907.

in elementary education, especially ordinary simple mathematical work—whatever school they come from, and I have them from all sorts of schools.

1293. Is there any means at the college to supplement that want?—We are able now to insist upon them being fairly well educated by stiffening the entrance examination; we have more students than we need, and we pick up the best ones by stiffening the entrance examination, and now that we are in a position that we can choose somewhat, we make it a rule that if the student is not a farmer's son, he must spend a year on a farm before he comes. I think a good school preparation and then a year on a good farm is the best preparation they can have, because then they are able to assimilate almost at once what they are taught, and it is beneficial for them.

1294. What is the average age of entrants?—Not under 16 now; it used to be 14.

1295. Is the supply of secondary schools in Cheshire adequate?—I think it is good.

1296. The general education they receive at those schools is good?—So far as my knowledge goes it is, but the general body of our students that come do not seem to be very highly educated, especially in simple, every-day matters.

1297. They have generally frequented a secondary school, have they?—In most cases. Some come direct from the elementary school, but only a few.

1298. Have you any higher elementary schools?—Yes, of the grammar school type.

1299. You consider a general education is what is wanted; you do not want a specific education to be given to them before they come into your college?—No; I think a good general education first and a year or two years on a farm afterwards, if possible, is the best.

1300. Is much manual work done on your farm?—The manual work since I took charge is not so much as it was. I endeavour to make it more educational, but they have as much work as they can possibly do on the farm, and an endeavour is made to familiarise them with all important operations, but it is not allowed to interfere with lecture work.

1301. The lecture work is the principal part?—Yes.

1302. Can you give us any information as to the future career of your students?—Yes; about 73 per cent. of those students that I have been acquainted with during the past three years are actually in occupation of land; about 15 per cent. have gone to land agency and land management; about 7 per cent. have emigrated; and about 4 to 5 per cent. have drifted into other occupations.

1303. I suppose the attitude of the landowners in Cheshire towards the college is favourable?—Very favourable indeed.

1304. Have you any observations to make as to the uses of the college farm for teaching purposes?—A certain number of them go out to work in the mornings at a quarter past six, and when they have learned one branch of it thoroughly I teach them something else, to go into the stable for instance, and get the ordinary routine there, and when they are able to answer questions satisfactorily on that they go off on to something else, calf rearing or management of pigs or something of that sort. Every possible opportunity is taken to illustrate the lecture work on the farm itself, and we also have a livestock lecture room where we can take all sorts of animals and have judging and veterinary lectures and valuation of stock and so on.

1305. Is veterinary science taught?—Yes, we have a lecturer, and there is an operating table in the lecture room, which is fully equipped.

1306. (By Lord Barnard.) Who own and control the institution?—The Cheshire County Council.

1307. So that there is no question about their grant, they are responsible for the whole expense?—Yes, they bear the whole expense except what we get in fees and the grant from the Board of Agriculture.

1308. Practically what you get from the Board of Agriculture goes to them too, because they maintain the institution?—Yes, they maintain the institution, and it is paid into the College account.

1309. I think you told the Committee that the college was conducted by an agricultural sub-committee. Is there any scheme or any governing document which describes what the school is for, and so on—the objects?—

If there is one I have never seen it: I do not think there is.

1310. How often do the committee meet?—Once a quarter.

1311. At the college?—Always at the college.

1312. Are you a member of the governing body?—Yes, I am a member of the governing body, I think—*ex-officio*.

1313. Do the students who come to you all go through the three years' course, or the bulk of them?—A capable man can go through in less time, but three years is the average they require.

1314. Do they all go in for the complete course, or do some of them leave before?—Some of them cannot spare the time to do the whole of it.

1315. Do you find that you have many failures?—No; as I said before, about five per cent. drift into other businesses.

1316. I did not mean that; I meant failures to pass the examinations?—Yes, we have, of course, but not very many.

1317. Do you know what the proportion is?—I should think, speaking quite broadly, about half of them sit for their diploma and are successful—I should say about half approximately.

1318. You have given us a list of the various professions and occupations of the parents of the students. I suppose we may infer from that that the Cheshire County Council in establishing this college have not intended solely to educate the sons of farmers, but to add to the general stock of knowledge of scientific agriculture?—Yes, that is one of its objects.

1319. Can you say from your own knowledge whether the result has been satisfactory in the case of the sons of men not farmers?—Eminently so, because some of the most successful farmers have been those who have never seen a farm until they came to the college.

1320. It has been suggested to me that you could give an instance. Can you think of one now?—The latest I can think of is a clergyman's son. A few months ago I heard from him, and his landlord had returned him his first half-year's rent because of the way in which he had cleared up his farm, which was in a very bad condition when he took it.

1321. I see in the Report of the Board of Agriculture and Fisheries on your College that you have one peculiarity, which I do not think you have mentioned, adapted from the Canadian system of a live stock lecture room?—Yes, I did mention that. We have built a live stock lecture room and live stock judging and valuing and lecturing is given there.

1322. Lectures are given by a veterinary surgeon, who is a member of the staff?—Yes.

1323. You have told us that some of your pupils take up teaching?—I should say about 3 to 4 per cent. take teaching posts and go to something higher.

1324. They generally go to Scottish Universities, do they not?—Yes, I think so; Edinburgh seems to be the favourite.

1325. Can you tell me what it would cost a parent to send a boy to your college?—£36 for residents in Cheshire plus a medical fee of one guinea.

1326. What is that for?—To cover all cost of medical attendance in case of sickness: and £48 for those who do not reside in Cheshire.

1327. Does the £36 cover everything?—Yes, the £36 covers everything: we have been thinking we ought to raise the fees as we consider we are charging too little, or, at any rate, to raise the fees for those who are out of the county.

1328. I see in the list of subjects taught, the word book-keeping is not mentioned. What instruction do you give them in book-keeping?—A complete course in book-keeping. I think you will find it is mentioned. They sit for that in the second year of the examination for the diploma, and they also take book-keeping again in the final year.

1329. Yes, I was wrong. How far do you consider it necessary to take book-keeping?—We take the ordinary double entry book-keeping, cashbook, journal and ledgering. We are compelled to do that because of the public

examinations. Those who wish to sit for those have to learn book-keeping pretty thoroughly.

1330. (*By Mr. Lamont.*) As to the vacations, what vacations do you have?—Usually three weeks at Christmas time—from a fortnight to three weeks—about a week at Easter, and about seven weeks in the summer.

1331. That is about 11 weeks altogether?—Yes.

1332. The rest of the year is practically all term time?—Yes, the whole of it.

1333. As to dairying, as we have heard, yours is a great dairy county?—Yes, a shorthorn county.

1334. About how many cows have you now?—About 23 at present.

1335. Dairying is not mentioned here. Do you have a definite course of dairying instruction?—We do: it seems somehow to be omitted. As I said before, dairying is more specially taught at another institution in the county: it is looked upon more as women's work.

1336. Do you do anything in the way of research as to feeding and its effect upon the yield of milk?—Yes, we do a great deal of that.

1337. And no doubt as to the effect of feeding on the percentage of butter fat in milk?—Yes.

1338. Are the results of those experiments valuable and watched with much interest by farmers?—Yes. I gave a lecture on the variations of butter fat in milk and it was printed and published and sent round to all the magistrates in the county, and we also send out a large number of year-books to farmers in the county.

1339. Do you do anything at all on the lines of the teaching of agricultural history?—I incorporate it in my opening lectures, but we do not make a special subject of it.

1340. In Denmark it has been found very valuable in stimulating interest, and to a certain extent patriotic interest, by having a definite course of teaching in agricultural history, giving more attention to the rise and fall of wages and prices and the history of land tenure, rather than to the rise and fall of kings and parliaments. Do you think that would be a valuable thing?—Yes, and I do not see any difficulty in incorporating it by making a special subject of it.

1341. (*By Mr. Staveley-Hill.*) In the course of the practical instruction that you give to your students you have said they have veterinary instruction. Do you give them any instruction in draining?—Yes, we are always doing some draining, nearly every year, and if we, perhaps, do not happen to be doing any at a particular time on the farm, I always arrange to go and see some somewhere else that is in actual progress.

1342. You said that you had as many students at present as you wanted?—I have had to refuse about 16 lately.

1343. You said you had 41?—Yes.

1344. You have in some years had a greater number than 41?—Yes, I mentioned that, but we are trying to reduce them in order to get a better class.

1345. You have raised the age also?—Yes, and I also had to dismiss a good many when I first went there.

1346. (*By Mr. Latham.*) Can you give us any reason why you have a dairy school for women?—It seems to be an idea of my committee that it is women's work in Cheshire. I have frequently urged upon them the importance of having a better dairy provided at the college, but they seem to be of opinion that it is sufficiently provided for in the provision for women at the other institution.

1347. Can you tell us what experiments are carried on on the eleven demonstration plots?—Manurial demonstrations on grass land.

1348. Have you any experience in fattening sheep on those experimental plots?—Cheshire is a very bad county for sheep; there are very few farms on which sheep would live and do well, and I think it would hardly be practicable in our particular county.

1349. You spoke just now of lessening your internal work?—No; that I hoped it would become a little easier than it is at present, and the staff would not be so much worked internally.

1350. Can you explain how you hope it will become easier?—I thought as time gets on we would get a better working class of students who would be trusted to put in more work of their own.

1351. What is their own work?—Their own private reading.

1352. On your work?—Yes, on lectures and their own references to text books and things of that sort.

1353. I see from this Report of the Board of Agriculture that you seem to have had a good many of these elementary teachers: "During the year, 190 teachers"?—That does not come under our college.

1354. Do you have any of these elementary teachers' courses?—We have had Saturday courses for them, but they have been discontinued, and we have been hoping, as I said before, to give a vacation course this summer.

1355. What is about the curriculum you put before them?—We give them some simple agriculture, physics, and chemistry—something very elementary and simple—and teach them the use of balances and barometers, and out-of-doors pruning, and so on, and if they show themselves capable they are allowed to do it themselves.

1356. That is rather horticulture, is it not?—There are a number of the schools provided with gardens.

1357. Do you rather lean to horticultural than agricultural teaching for the school teachers?—Yes.

1358. I notice you do not put land surveying down as part of your curriculum?—Yes, it is down, and it is also an honours subject in the diploma.

1359. You spoke just now of a clergyman's son being one of your successful students?—Yes.

1360. Can you speak of it as a living that he has made of it? How satisfactory financially has he been?—He is making a good comfortable living.

1361. It struck me as rather strange that in a county like yours you should have to single out a clergyman's son as the most satisfactory student you had?—I was asked if I could give an example of one who had not previously been brought up on the land, and I gave that as one of the most recent.

1362. Can you speak as favourably of those who have been brought up as agriculturists?—Most certainly—without the slightest hesitation.

1363. I should like to know what practical work you give students?—They do as much practical work as is possible for them without interfering with the lecture work; for instance, they all get a little turn at cutting and laying a hedge properly, and making up a ditch and the bank; they all get a little turn at draining, and they are all shown how to set and work a plough and milk, and how to bring up calves until they are a year old, and so on, but every endeavour is taken to make it educational and not merely manual.

1364. You spoke of the future career of those who have had a college training. Will you give me those figures again?—About 73 per cent. are actually in occupation of the land; 15 per cent. have gone to land agency and land management; 7 per cent. have emigrated; and 4 to 5 per cent. have drifted into other businesses.

1365. What sort of farmers would the 73 per cent be. Are they large farmers or ordinary small farmers or what?—I should say they began in a smallish way in some cases; others farm up to 500 acres.

1366. £36 is rather a large fee for some of these small farmers. How do you manage with the poorer class farmers?—I think I have said that a good many scholarships are awarded by the Cheshire County Council covering the whole cost of board and tuition.

1367. How many do you think there are altogether?—Twelve per year.

1368. And they are always filled?—Yes, they are always filled, although of course since we have been able to get so many paying students we have reduced the scholarships to the most deserving cases only.

1369. With regard to the uses of the college farm for teaching purposes, you have told us that the farm consists of 100 acres. How do you divide it for teaching purposes?—It is worked on the five course rotation, in keeping with the usual custom of the best farms in Cheshire. We grow many varieties of potatoes, mangels, wheats, oats, barley and live stock.

1370. Is any portion of the 100 acres used as an experimental farm?—The whole of it really is worked as an experimental farm primarily.

1371. Then I suppose we may take it you cannot make much profit out of it?—No; I do not think you can expect an experimental farm to pay.

Mr.
T. J. Young.
2 May, 1907.

Mr.
T. J. Young.
2 May, 1907.

1372. Dairy teaching I think you said is also done ?—Yes, but most of the dairy instruction is carried out at another institution.

1373. (*By Mr. Middleton.*) I was not quite sure about the number of your students. You gave us an average number of 125 per annum ?—Yes.

1374. Then you mentioned that at present you have 41 in residence ?—Yes.

1375. You arrive at the number by multiplying the terminal number by three, is that it ?—Yes.

1376. Can you give us the number who actually reside with you for three years, it is about 41 for one year ?—Yes. Nobody comes for a shorter period than a year normally. Of course, there have been a few cases in which some family reason has caused them to leave us before, but otherwise not.

1377. So that you have practically about 40 students a year ?—Yes. We can contain 41.

1378. The course is three years ?—Yes.

1379. That means you have an entry roughly of 16 every fresh year ?—Yes.

1380. Is the number of scholarships 12 per annum ?—12 are offered per annum and the best are selected out of those.

1381. Do your students keep any note books in connection with their practical work ?—Yes, they have to pass an examination in practical work. All the different heads of the subject are set out and they are examined in each one, and they have to pass it. If they are found satisfactory then they do not need to take the course again and they are put on to something else.

1382. You hold practical examinations at different periods ?—Yes. Perhaps a student has been taking calf-rearing for some time, and he may ask me to put him through his facings, and if I find him competent, I put him on to something else.

1383. How many practical subjects have you ?—Feeding calves, stables, pigs, milking and management of dairy cows, and sheep—five altogether, besides land work.

1384. Before you allow them to enter for the diploma they must have satisfied you that they are competent on those practical subjects ?—That is so.

1385. And get certificates signed by the Principal ?—Unless they have got their books signed up with all the principal heads in.

1386. (*By Mr. Davies.*) I understand that the college is under the direct control of the County Council ?—Yes.

1387. Do the County Council carry out any county work besides in the way of lectures ?—In horticulture.

1388. There is a dairy school in the county in addition to your college ?—Yes.

1389. No agricultural work is done in the way of lectures ?—No.

1390. That is the reason why you desire to have an extra man for experimental work ?—Yes, I think that would be most useful.

1391. There are no short courses at all in the college ?—No. I ought to say with regard to those short courses that I am hoping to organise an evening short course for farmers' sons who are not able to attend the long ones—a course of perhaps 20 lectures in the winter. That may be of interest.

1392. You told us that the County Council award 12 scholarships every year. What examinations are held on the results of which those scholarships are awarded ?—There is an examination on general knowledge, elementary mathematics, writing, composition, and those sort of things, and then I give a *viva voce* examination as well.

1393. The scholarships are awarded on the result of that examination ?—Yes.

1394. Do they last for more than one year ?—They are renewable for the complete course. They are awarded for one year to start with, but if the student's work is satisfactory they are extended for three years.

1395. Do you pay any of the pupils for the actual work they do on the farm ?—No.

1396. What relation would your diploma bear to the National Diploma of Agriculture ?—It is pretty much of the same stamp except that it takes in one or two other subjects.

1397. You told us that you had a lecture-room especially

designed for live stock, and in which you give lectures ?—Yes.

1398. Do any of the farmers in the neighbourhood come there and attend these lectures ?—It has not been built long, but I am hoping in time they will. It has not been on trial long enough yet.

1399. You have never had any stock-judging by outside farmers ?—No.

1400. (*By Mr. Medd.*) You have a very successful horticultural side to your work ?—Yes, it has always been so.

1401. That is under the superintendence of Mr. Neild ?—Yes.

1402. The instruction there is of a very practical character ?—Yes, I think so.

1403. I believe the people from the horticultural side of your college have very little difficulty in obtaining good employment afterwards ?—I do not think they have much difficulty.

1404. The terms are the same on both sides ?—The fees are the same.

1405. What is about the proportion, how many pupils have you now on the horticultural side ?—Seven or eight.

1406. And the remainder on the agricultural side ?—The remainder on the agricultural side.

1407. To go back to the training of elementary teachers, before you went to Holmes Chapel, they had continuous Saturday courses there ?—Yes.

1408. The success of those courses was so great that they then decided to have courses at centres throughout the county, and they have now courses at six different centres ?—I have no knowledge of whether they were a success, but I believe they were.

1409. I think some time after they began they were held at Owen's College, but now the benefit from those courses of training has been realised so much, that they have them at six centres in Cheshire ?—I am not aware of it beyond the school gardens, of which there are 20.

1410. The inspection and supervision of school gardens at the elementary schools is done by your staff ?—Yes, by two of our staff.

1411. Has it given you any idea of the character and quality of the work done at your schools ?—It is rather early to judge because we have only just got them practically started, but there is a scheme drawn up to which they are to adhere, and they are visited by our instructor once a fortnight.

1412. It is thoroughly systematised and in working order now ?—It is.

1413. It is not left to the individual efforts of the managers of the schools ?—No, they have to adhere to the scheme.

1414. Every effort is made in your county to systematise the instruction in horticulture, from the elementary schools upwards ?—Yes.

1415. Can you say the proportion who come to you from the elementary schools ?—A small percentage come from the elementary schools. Most of those, I might say, go into horticulture.

1416. In addition to the defective arithmetic that they display as you told us, are there any other points in which as a rule the elementary school children are defective ?—I do not know that it is confined to the elementary school children.

1417. No, but take them first.—There is a serious deficiency in spelling mostly.

1418. In regard to application what have you found ?—My experience is that pupils from the elementary schools, especially those that come with the scholarships, are the worst workers ; those who pay fees are the best workers except in a few instances.

1419. Have you had any opportunity yet of judging whether there is any difference between the quality of the boys from the elementary schools where they have gardens, and have had rural teaching, and the quality of the boys from an elementary school where they have not had a garden and no rural teaching ?—I have not had an opportunity of judging of that yet.

1420. In the secondary school students you find a deficiency in arithmetic and mathematics ?—Yes.

Mr.
T. J. Young.
2 May, 1907.

1421. Do you find the same want of application in the scholarship boys?—I say that my experience is that the pupils that come with scholarships are the worst workers, and that those who pay fees are the best.

1422. Generally people value what they pay for most?—Yes.

1423. In regard to anything in the nature of a general average of intelligence in those boys who come to you first from the elementary schools, are they wide awake and alert, or are they dull and lethargic and uninterested?—I think I should describe them as fairly wide awake and intelligent.

1424. And the secondary school boys?—I think they are much the same.

1425. (*By the Chairman.*) What becomes of the students who take the horticultural side: what is their after career?—A few of them might have property of their own that they want to plant up. At the present time I think there are three who own some land and want to grow fruit upon it, and the remaining five will have to go into gardens and work themselves up into a position of head gardeners or something of that kind.

1426. Has it ever been contemplated to give at your college short winter courses for another class of students?—Yes, that is a thing that will have to be met, and I am arranging this winter to give evening lectures to farmers and their sons who are unable to attend the ordinary courses.

1427. Do you think that will be successful?—I am hoping so. At any rate, I think it is a thing that ought to be tried.

1428. Your committee are in favour of the attempt being made, are they?—I feel sure that they will be. From what I have heard from time to time I think they will welcome it.

1429. Are there any local committees in Cheshire for the purpose of giving agricultural lectures or agricultural education by experiments?—No, no local committees, but a good many people take an interest in it. We have no local committees organised for that purpose.

1430. I suppose you would say that an organisation of the local committees would be desirable?—Yes, I should say perhaps it would, although the county is not a very large one.

1431. All your students are not resident, are they?—Yes, they all are resident.

1432. Would you not admit any non-resident student?—The question of accommodation is rather a difficulty. We are intending to build accommodation for about 16 to 20 additional students. Plans are being prepared now for building additional accommodation.

1433. At present, as regards labourers in Cheshire, there are no organised lectures given to them?—No. An endeavour is being made to educate the tenant farmer in the hope that he will carry the instruction he gets to his workmen in time.

The Chairman. Lord Egerton is here, and I hope the Committee will allow him to state his experience in the county.

Lord Egerton. I know in my own school there are lectures given and agricultural instruction is given, and the boys are taught by means of a herbarium the names and uses of the different grasses, and I have seen books in which grasses are all tabulated and the names given and a general description of them. I know that lectures have been given, and I think the county council have also given some lectures, but I am not certain about that.

The Witness. Not during the last two years; they used to do it.

Lord Egerton. I am not prepared with any definite information, but speaking from my general knowledge I know they did give them, and I know in my own school

they have certainly been giving lectures on the elementary principles of the land and the soil and the products of the soil, and grasses, and so on—of course ours is essentially a grass county—and the use of manures especially applicable to grass land.

1434. (*By the Chairman.*) Can you tell us why those lectures were discontinued?—I think the main reason was that they had covered the ground pretty fully, and that the attendance was not large; that is my recollection of it.

Lord Egerton. My impression rather was that it was because they were in the habit of giving lectures on different subjects. Sometimes it may be an agricultural lecture and sometimes a St. John's Ambulance lecture, and then something else, but I do not think they have lost sight of it altogether.

1435. (*By Mr. Latham.*) From your remarks might we take it that your scholarships are rather disappointing?—Yes, some of them; I do not wish to condemn the scholarship holders at all, but as a rule I found that the scholarship holders were, if anything, worse workers than those who paid for their instruction.

1436. I suppose they would be rather of a lower class, would not they?—Yes, perhaps.

1437. More difficult to teach, and less anxious to learn?—Yes, I dare say that is true.

1438. Have you given any outside lectures to farmers in the market towns?—The staff do occasionally, or fairly frequently, give lectures in a private capacity when invited to do so at farmers' meetings and things of that sort, but we have no organised system.

1439. When they have been given, have you found that the lectures have been well attended?—Yes, I think fairly well attended.

1440. (*By the Chairman.*) I see in the horticultural department that a new section of the fruit plantation is being devoted to experiments on trees planted in arable land and in grass. Is that with a view to giving encouragement to the planting of orchards?—I think it is chiefly to demonstrate the difference in the growth of trees when planted in a grass crop and a clover crop and without any crop at all; there is half an acre of that.

1441. Does that apply to the agricultural side as well as to the horticultural side?—Yes. The agricultural side receive horticultural instruction, but they do not do all the detailed work that the horticultural students have to do.

1442. Has that gone on long enough to enable you to state the influence that that has had? Has that influenced the farmers in the way they plant their trees?—In one instance it has most decidedly. Of course I have not been in Cheshire very long—only three years—but in one instance it has influenced a farmer, who has planted apple trees in his hedges all over his farm.

1443. (*By Lord Barnard.*) With regard to the scholars who are sent to the college by the County Council, do you make any report to the Education Committee of the Council as to the progress they are making in the course of their studies?—Yes, I report quarterly; especially if there is any cause for a strong report, if their work is not good.

1444. Is there any condition in the award of those scholarships that the holder must perform his duties diligently to the satisfaction of yourself?—Yes, that is a very strong condition.

1445. So that if the scholar was idling, or neglecting his work at all, the scholarship would be withdrawn?—Yes; I sent 15 down when I first went there. If the scholarships are not well held they are dismissed.

1446. (*By Lord Moreton.*) Is it obligatory upon the students at your college during their holidays to spend their time on farms?—It is not obligatory, but a good many of them do go during their holidays and get practical experience on other farms.

Mr. G. W. HILL, called and examined.

1447. (*By the Chairman.*) Are you connected with the College at Holmes Chapel?—Not at all.

1448. You are prepared to give evidence as to the use to which the college is put by the agriculturists in the county?—Just so.

1449. Will you mention to the Committee what your experience is with regard to the college?—I have known this college ever since its commencement as a college, and I have noticed the increased interest that farmers have taken in the college for a considerable time. There did not

Mr.
G. W. Hill.

Mr.
G. W. Hill.
2 May, 1907.

seem to be much interest taken in the college at first, but now I find that there are more applications for advice, and I see that farmers are sending more samples to the college every year to be tested for purity.

1450. That means to say the farmers understand the practical importance to them of the agricultural side of the college?—Yes; it is getting more widely known amongst farmers every year, and if any man has anything wrong, as he thinks, with his stock, or he wants his samples tested, he does not hesitate now to send them to the college; he is getting to understand more that the college is of benefit to him.

1451. Is there a general approval of the reform which was introduced in the management of the college?—Yes, that is so; that is my knowledge.

1452. Have you any suggestion to make with regard to the method of instruction at the college, or in what way it could be made even more generally useful than it is now?—I am connected with several large bodies of Farmers' Clubs throughout Cheshire—I think three—and I should like to see lecturers from the County Council College at Holmes Chapel attending some of those meetings. They get largely attended by farmers; in fact, entirely attended by farmers.

1453. At those farmers' meetings various subjects are discussed, I suppose?—Yes, and I should like to see lecturers from the County Council College come there. Sometimes we get lecturers from London and other districts, but if we could call upon the County Council to supply us with a lecturer I think it would be very greatly to our advantage in many cases.

1454. Would you like those lectures to be systematically organised?—I would.

1455. (*By Lord Barnard.*) Are you a farmer?—Yes. I have been a farmer all my life, but retired last autumn.

1456. Are you a member of the County Council?—No.

1457. I understand from you that the farmers are more and more inclined to send samples to the college for analysis?—Yes.

1458. In fact they prefer that to the procedure provided for them by the Fertilisers and Feeding Stuffs Act?—Yes, I think so; I myself sent about 22 samples this year, and I sent about the same number last year.

1459. Is there any difference in the fees? Does the college charge a fee, or do they do it for nothing?—In some cases they do it for nothing.

1460. The county analyst would charge a fee, I suppose?—There would be a small fee to the county analyst.

1461. (*By Mr. Lamont.*) Although you are not on the County Council yourself, can you tell me whether there are any farmers who are members of the County Council?—Yes, I know there are several.

1462. So that, if there is a general desire that lectures should be given, they would have an opportunity of voicing the desire before their brother councillors?—Yes.

1463. I suppose, if there were any desire against it on the part of the County Council, it would not arise from any disapproval of such work?—No, but I do not think the farmer likes to think his rates are being increased for those lectures.

1464. Therefore your view is that it ought to be done, but by a grant if possible from the Board of Agriculture, and not out of the rates?—Yes, that is my opinion.

1465. (*By Dr. Somerville.*) Have the young men

who have gone through this school at Holmes Chapel proved a conspicuous success among the farmers round about?—Those that I know are certainly intelligent young men; they have done very well. I know several of them and they know things that other farmers do not know.

1466. Do they manage their farms well, and, so far as one can see, make them pay?—Yes, so far as one can see.

1467. I suppose the college-bred farmer is not now regarded with any sort of suspicion in Cheshire?—At first I am afraid that was so. We thought the practical man had a great advantage over the scientific farmer, but now we are working round to the opinion that a farmer must understand thoroughly the scientific point of view as well as the practical point of view.

1468. So that landowners would have no hesitation in letting their land to men who had had their training in Holmes Chapel College?—He would probably want to know something about his banking account, first of all.

1469. Do you think that scientific agriculture is being appreciated more generally among the rank and file of farmers' sons in Cheshire than it was in the old days?—I can mention it in my own case; my land was growing a certain class of grass, and I could not understand why it was, so I approached the principal of the college and he told me that it wanted lime, and I used lime all over the land, and I found that that was exactly what it did require.

1470. Your neighbours, who would know, no doubt, of your taking advice from the college staff, would be more disposed to follow your example, I suppose, after that?—All I can say is that all over the district they used lime on their land after that with the best results.

1471. May one take it that the prejudices against college education have practically disappeared now?—That is my opinion; there were great prejudices at first, but they are wearing down, because they see such really good work being done by the college at the present time.

1472. So that really the most pronounced type of old practical farmer would like his son now to go through the college course?—I believe that is the opinion of the farmers.

1473. (*By Mr. Staveley-Hill.*) You have spoken of the advisability of having lectures all over the county; I suppose that is for the benefit of young farmers?—Yes.

1474. Do you think in Cheshire there would be any advantage in having lectures for the labourers?—I am afraid you would not get the labourers to attend—not largely. After their day's work they do not seem to want to go to meetings.

1475. We have had some evidence from Essex this morning, and I should like your opinion with regard to Cheshire on that point.—I am afraid we should not get them to attend. A few would attend, but not the quantity we should like to see.

1476. (*By the Chairman.*) Is there any co-operation among the farmers in Cheshire?—This last 12 months there has been a little co-operation, but not to any extent. I presume you mean in buying and selling?

1477. Yes. The Co-operative Supply Association, I understand from Lord Egerton, has been in operation for the last 25 years?—Yes, that is so—at Nantwich, and it is doing tremendously well; last year, I believe, they turned over £103,000.

1478. Is that co-operation also applied to the creameries?—No; I think not; I do not know of any.

FOURTH DAY.

Tuesday, 7th May, 1907.

PRESENT:

The Right. Hon. Lord REAY, G.C.S.I., G.C.I.E. (*Chairman.*)

The Lord BARNARD.

The Lord BELPER.

Lord MORETON.

Mr. F. D. ACLAND, M.P.

Mr. DAVID DAVIES, M.P.

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Professor T. H. MIDDLETON, M.A., M.Sc.

Professor W. SOMERVILLE, D.Sc.

Mr. H. S. STAVELEY-HILL, M.P.

Mr. A. E. BROOKE-HUNT (*Secretary.*)Mr. H. FRENCH (*Assistant Secretary.*)

Mr. A. D. HALL, M.A., called and examined.

1479. (*By the Chairman.*) Mr. Hall, you were at Wye, I believe, and I should like to put a question to you. What was your experience of the percentage of farmers' sons who attended the Wye College?—I could not give you the statistics, but I should say, offhand, probably about 40 per cent. were the sons of farmers.

1480. What is your opinion of the work you conducted at Wye? Which part do you consider the most valuable to the farmer?—Well, the man who was actually farming at the time in Kent was most interested in the experimental work. For example, in connection with hop-growing, there is no doubt we got more in touch with the local farmer by going about experimenting with hops and discussing hop matters than in any other way. When we first opened the college we met with a great deal of opposition and prejudice. But we took up the question of hop-growing scientifically with a great deal of energy, and so we gained the confidence of some of the more important farmers—and the important farmers in Kent are hop-growers. Of course this outside experimental work was only a small portion of the college work.

1481. And what further development do you think could be given to the work at Wye?—Oh, I think the work at Wye is going on on perfectly sound lines. It is getting a big class of students that it is educating for farming and others for administrative work. Then it continues its experimental work amongst the farmers and the fruit and hop-growers.

1482. And what do you find is the attitude of the farmer now?—His attitude has entirely changed since we first began. At starting we met with very considerable local opposition merely because the farmers were under a misapprehension of what we wanted to do. But I am quite sure when I left Wye, and at the present time, the larger farmers and the people with whom we came into contact were entirely on the side of the college. They believed in us, they sent their sons to the college, and recognised the valuable work that we were doing.

1483. Were any local lectures given?—Yes.

1484. What was your experience of the attendance at those local lectures?—The college had grown out of a system of local lectures. While the college was being established, the lectures were going on and I was one of the lecturers. These were given on general topics—agriculture, chemistry, feeding stuffs, manures. They were never very successful, and we eventually dropped them entirely in favour of other courses dealing with actual experiments that had been carried out under the auspices of the college; that is to say, short courses of free lectures about hop-growing that dealt with our particular experiment, courses on some points connected with barley, and similar special courses of lectures based on local experiments and first-hand information were extremely successful, though not, perhaps, numerically. You might go and give a lecture about barley, and perhaps you would have ten men; but they would include all the biggest barley-growers in the district. I can recall such a case where there were, perhaps, only ten people all told, but it is worth while going just to talk to these men. I am a disbeliever in general courses for farmers, such as agricultural chemistry, but a very special course is extremely useful if there is some first-hand information behind.

1485. Therefore, your opinion is that although the attendance is small, still the lectures are of great use?—They are very necessary to keep the people in touch with the collegiate centre. If you are working a wide area you cannot persuade farmers to come to the college often. Sometimes they never hear of it, and it is extremely difficult to get them to know that such a place exists, or what facilities the place offers to them, and I know of no other way of getting them to know other than by doing a certain amount of lecturing.

1486. You consider the value of these lectures is that they enable the college to get in touch with the farmers?—I think they are very useful in that respect.

1487. Was your experience that the staff at Wye was adequate?—We started with a very good staff. We always had a good staff; in fact, we started with a staff much bigger than the numbers justified, and grew up to it.

1488. Then do you consider the grouping of the counties for the purposes of agricultural education should take place through the instrumentality of an institution like the college at Wye?—Oh, yes, certainly.

1489. Then I think you have already mentioned that you consider there is a great advantage in the experimental work which is carried on by an institution such as that at Wye?—Yes.

1490. Did you consider that the grants allotted to Wye were sufficient?—My time was a long struggle against poverty, because we were a rapidly growing institution working on a scale that had never been anticipated; but I think we were very well treated. The counties grumbled but paid, and they have increased the grants since I left.

1491. Are you of opinion that the Board of Agriculture should grant more for the purposes of agricultural education?—Oh, certainly, in the sense of seeing that it is spent on education. I don't want to see the Board of Agriculture laying down a programme of work or anything of that kind. I think it is desirable there should be as much local flexibility as possible in this education. But I do want to see Councils which do not spend anything at all on agricultural education forced to do something and come into line. There are many Councils—there is one notorious case, West Sussex—where they do not spend a penny on agricultural education of any kind, neither collegiate nor lectures, nor anything else. I think some means ought to be devised by which, if the local authority won't spend the money, the Board of Agriculture should step in and do it for them.

1492. (*By Lord Belper.*) Do you suggest the counties should put the whole of the expense on the rates?—The county authority is at liberty to devote the "whisky money" to the relief of the rates.

1493. You mean the money they get from the Treasury grant?—Yes.

1494. (*By Mr. Medd.*) I believe this is the point, that West Sussex does, of course, allocate the "whisky money" to education under the Act of 1902, but none to agricultural education; that's the point, is it not?—Yes.

1495. They spend it on education, but ignore agriculture?—I don't think they spend the whole of the money. In some counties they use part of it for the relief of the rates.

Mr.
A. D. Hall.
7 May, 1907.

Mr.
A. D. Hall.
7 May, 1907.

1496. (*By Mr. Latham.*) But if the money is spent on agriculture, it does save the rates?—When I was concerned with it, no expenditure on secondary education fell on the county, and the money went to the relief of the rates.

1497. (*By the Chairman.*) That is your experience?—It was.

1498. You don't want the Board of Agriculture to prescribe for the counties?—I think the Board of Agriculture can do a great deal of good in giving advice and pointing out that certain types of education have been tried and failed, and certain other types are likely to succeed; but I think you must leave the local authority to run its own institution.

1499. Do you think the type of institution must be influenced by local conditions?—Oh, very strongly.

1500. Then you are in favour of open scholarships being a condition of the grant?—That is rather a suggestion that I threw out to get over one very great difficulty, that these groups of counties each of them erect a barrier against other counties. A farmer in a particular district does not always find available the particular form of education that he wants. To take an example, East Sussex has a college of its own at Uckfield. At Wye hop-growing has always been rather a feature of the place, and a Sussex hop-grower, if he wants to send his son to Wye, is treated as an absolute outsider, and would be asked to pay nearly twice as much, if not actually twice as much, as if he were a resident in Kent. Again, I think there ought to be some way by which a man, if he lives in a county that only has what I would call a school of agriculture and he wants to get to a University college, there ought to be some ladder for him rather than that he should be called upon to pay the whole cost of education, since most of the colleges work on the theory that they will give assisted education to their own ratepayers, but anybody who lives outside the contributing counties must pay the whole cost of education as near as they can gauge it.

1501. (*By Lord Belper.*) Surely the counties that contribute funds for keeping up a college of that sort are entitled to send students on more favourable terms than those from outside?—Certainly.

1502. Then if you had established a college yourself, or had joined with any other county, they would be able to send their students to this college on favourable terms, in the same way as Kent and Surrey are able to send theirs?—I might say this: the Board of Agriculture contributes £1,000 a year to Wye.

1503. And to many others?—The Board might say, "This is State assistance, and in return you ought to found one or two open scholarships every year that shall be open to the country at large." The Board's grant is received from the country at large; it seems a pity that all these colleges should erect barriers, that there should be a number of watertight compartments.

1504. Does not the pity arise from the fact that Sussex does not spend any money in education which would be useful?—What I was rather trying to bring out was that a county may be spending money and may have got a school—

1505. Then you took the wrong case. Sussex does not contribute, as I understand?—East Sussex has a college of its own at Uckfield.

1506. You spoke of Wye; your county does not contribute to the expenses of that?—Oh, no.

1507. (*By the Chairman.*) You think the Board of Agriculture should, apart from the grants it gives to colleges, spend a certain amount of money on these open scholarships?—I think a little might be done in facilitating interchange by some system of open scholarships.

1508. That it should be open to everyone in England to send his son to any college, and that the Board of Agriculture should give money for that purpose, that is your point?—I think so. My point about Sussex, East not West, was this: Uckfield suits them very well for a certain type of work, and it meets the need of the county; but there are some farmers who want a different type.

1509. You think there are no scholarships available for them to send their sons to another institute. Then with regard to the diversity of type which you advocate, the result of that, of course, would be that there would be a great variety in examinations. There should not be one type of central examination, but the examination should correspond to the teaching given in these various institutes?—That if there is to be one central examination, it should be very flexible, and with strongly marked teaching interests represented.

1510. Your view is that the examination should entirely

correspond to the teaching?—Yes, I believe it should always follow the teaching.

1511. And not the teaching follow the examination?—Certainly not.

1512. Then your view is that agriculture should not be admitted in the secondary schools and the grammar schools, but that there should be general science with an agricultural bias?—Yes; I think agriculture is quite out of place in schools proper.

1513. They must have general education and no specific agricultural education?—Yes.

1514. And you consider that no agriculture is therefore wanted at training colleges but what is sufficient to qualify the teacher for the college experiments?—I think the difficulty that the elementary schoolmaster has in carrying out any teaching of this kind is not so much that he has not been given information, but that he has not been taught to go to work in the right way; he does not begin with the things round about him and do simple experiments upon them; he works from books and not from things. Now, if you taught him agriculture at the training college, you would only pour one more dose of information into him; instead, he should be taught how to use his fingers and do experiments, and to get into the habit of treating a subject simply and in untechnical language. The elementary schoolmaster has been brought up so much on books and so little on actual things, that his tendency is entirely to teach from books, even when dealing with the simplest facts of plant life. The teacher prefers to draw pictures upon a blackboard and dictate notes; but what we want him to do is to have things growing in plots and pots, to look at them, play with them, and make the children work with the thing itself. Of course the training college has an enormous amount of work to get into the time the teacher is there, and I do not think we ought to force him to take up any more subjects, but he ought to have one subject which would lead him into the method of experiment, so that he can develop his teaching afterwards on the right lines. So long as he knows how to experiment he can work out the rest for himself.

1515. When you were at Wye, were there any special courses of training for agricultural instructors?—For the training of elementary schoolmasters we had a series of summer meetings; the teachers were sent by scholarships from the County Councils, and we used to put them through a normal course. I used to go and teach in the elementary schools in Wye to see what could be done with the children, and on that experience we arrived at what I called a normal course—dealing with the way a plant grows, and then we used to make the teacher do experiments nearly all day for the two or three weeks he was at the college.

1516. As regards the higher agriculture, you consider the course at Wye was sufficient, and there was no need for any special addition for those who afterwards wished to enter upon teaching?—Well, I am afraid there was. I do not think the agricultural college is quite the place to draw your teachers from for other agricultural colleges.

1517. You think they ought to go to the University?—For many subjects. For instance, I think the teacher of agricultural chemistry ought to have been a pure chemist and have gone through the ordinary training before he looks at agricultural chemistry; and, similarly, the teacher of agriculture ought to have some working knowledge of farming beyond what he may have learnt at a college.

1518. The teacher of agricultural chemistry should have been through the ordinary training at the University?—Quite so.

1519. Then are you in favour of what we might call winter schools for agriculture—short courses being given during the winter, which would be attended by farmers?—I think that represents a very necessary type of organisation suited to certain districts in the country better than to others. That is one of the types I have in mind as desirable, and they succeed very well, I think.

1520. (*By Lord Belper.*) I think since the 1902 Act the "whisky money" must be spent on secondary education. When it was first given, I believe there was some put into the rates, and not spent on education?—Of course, I am not really *au fait* with that side of the subject, but I judge from the reports. From the Annual Report of the Board of Agriculture on the Distribution of Grants, it is evident there are a number of counties which spent either nothing or a very trifling sum on agricultural education.

1521. My remarks do not refer to agricultural education. It might be spent on agricultural education or any other

education. I don't want to weaken your point. I only meant they could not spend it on rates now?—I quite accept that. I am speaking without knowledge of the state of affairs since the last Education Act.

1522. Of course, with regard to the college life at Wye, I suppose you instanced it because it was a college in your own neighbourhood and you knew it?—I was Principal.

1523. You mentioned that because you were conversant with it?—Exactly.

1524. Of course there are many colleges besides which are receiving grants, and if those colleges were obliged to give scholarships to enable the counties outside to send in students, it might have the result of limiting their scope?—I don't anticipate any large number. I want to see a chance given to the farmer. I take it a farmer as such can never pay for the education of his son, or very rarely. It is a very expensive form of education.

1525. I quite agree in your view. My only point was that when a county spends a great deal of money it is rather hard on them if they are to have imposed on them students from other counties.—I know the difficulties in the way.

1526. (*By Lord Moreton.*) You spoke of the local feeling when that college was started; was that entirely owing to the suspicion that was sometimes supposed to exist in the farmer's mind with regard to scientific agriculture, or any particular local circumstances?—I don't think there were any local circumstances; it was merely the general idea against "bringing these people here to teach us our business."

1527. On the question of teaching book-keeping at institutions like Wye, how far do you think it desirable to teach the ordinary agricultural student book-keeping? May I put it in other words? Is it necessary in your opinion to go quite so far in teaching book-keeping as is done in other schools?—I feel the whole system of agricultural book-keeping wants reforming at a place like Wye. Now in my time the custom was to put a man through the mill of ordinary book-keeping by double entry just as if he were going to be a merchant or anything else. Well, on the basis of some personal experience of my own, I do not think that book-keeping does any good to the farmer; it does not meet his case. I believe a good deal of the carelessness of the farmer about keeping books is because he can get no information out of them. What I want to see done by the men who are teaching in the colleges is to see if they cannot set this business of farm book-keeping on a fresh basis that shall give information to the farmer about the different departments of his business. Then I think there would be some justification for teaching it very thoroughly indeed, because the future of farming depends upon the farmer realising exactly what the different operations cost.

1528. May I take it that for the purposes of the ordinary farm you would be inclined to teach rather more book-keeping than is necessary for the farmer to possess when he fills up the paper for an income-tax appeal?—I think book-keeping should be a very essential thing, but I want to see it taught in a different kind of way.

1529. (*By Mr. Latham.*) You spoke of farmers, small and large; did you find the large farmers coming to you in any great force?—The smaller farmers did not come nearly so much. Much, however, depends on the style of farm; if a man had a small mixed farm with a few stock and a little corn, he had less to gain from a place like Wye than a man who was growing five acres of strawberries and ten acres of mixed fruit. There were a lot of things he could come and ask about, and we could help him. But if a man merely had grassland and kept a few cows, there was very little we could do for him. In that kind of business he did not meet with many difficulties about which he could appeal to us for help. I always found the more special the industry the farmer was carrying on, the more help he could get from a scientific man.

1530. You have taken a very great interest in growing cereals; won't your information help the small man equally with the big?—Well, he is less inclined to come, and it is more difficult to get at him.

1531. I want to know if you can suggest any means by which you can get at him?—Well, the only means I can see is by having experimental plots organised all over the district, and by having a regular system of travelling lecturers. I notice in France that they have a pair of Departmental Professors—each Department has two Professors—whose sole business it is to circulate and give information, and they have to deal with small farmers in a way we have not. On the whole they work by experimental plots and by lectures in connection with them, and by putting it in the hands of two men in each Department, whose sole business is to do this kind of work, they have

had more success in getting at the small man and giving him information than we have had in England, because they have it better organised. Only two or three weeks ago I was talking to a little farmer in Normandy—I think he farmed the equivalent of about 60 acres—he grew wheat amongst other things, and I asked him what kind of wheat he grew, and he told me he grew "square head." I asked him where he got it from, and I learnt that he had got it through the instrumentality of one of these experimental plots. He had been to see them, and the lecturers had procured for him varieties of the seed.

1532. I have very little doubt but that you hold much the same opinion as most of us who farm largely, that there is much advantage in changing seed?—That is highly desirable.

1533. It is difficult to impress that upon small farmers, but would they not get great advantage from it?—Yes.

1534. You said just now that the lectures were rather a failure; don't you think often they are far above the heads of these people?—I said the first set of lectures were largely a failure, because they were given by the wrong people.

1535. Too scientific?—I should prefer to say, too abstract. People like myself were sent to lecture, and we had not learnt our business. That is the plain truth of the matter. But when we had done a lot of experiments and had first-hand information to talk about, and had something new to say and some experiments to illustrate our remarks, then the farmer would come and listen; but he won't come and listen to lectures about nitrogen and phosphoric acid, and I don't blame him.

1536. Have you tried by the limelight to show the benefit of these experiments?—That I think can be done when you have got your basis of experimental work to talk about and make it special and local. You must not make lecturing too general.

1537. That is to say if you make it interesting they will come?—Oh, yes.

1538. Now you spoke just now of special education for certain districts, will you kindly explain what you mean?—I mean rather this. Take the district which I know best, the south-east of England. The men who are worth most attention down there are the big growers of fruit and hops, that is a class worth catering for. They are men with capital embarked in the business, and they are working a very highly scientific business, and so you are justified in that district in putting down a college and giving a highly scientific course like Wye does. But I know other parts of the country where the general run of farmers does not call for quite that type of education, and where it might be desirable, and it has been proved in fact to be desirable, to have something less scientific and shorter courses. I do not say less thorough, but not going quite so far, and more of a practical nature.

1539. You mentioned different fees, in and out. Where is the money to come from for those fees. The interchangeability?—My suggestion was that if the Board subsidised an institution like Wye or Cambridge, in return for that the college might be asked to found one open scholarship a year.

1540. You are speaking of the college that receives the money?—Yes.

1541. I was rather sorry just now to hear you make the remark that you did not consider farmers were in a position to educate their sons—has that been generally so?—I did not mean it quite in the sense you are taking it. I mean that agricultural education generally is a very expensive business. I should think the net cost at Wye is something like £150 a year, exclusive of capital outlay. Now I don't think the farmers, whose sons are there, as a class can afford £150 a year. You see in no other form of higher education that I am acquainted with, whether it is engineering, or law, or medicine, or anything else, does the student pay the whole cost of it. There are such a number of old foundations that you never pay the real cost of the education.

1542. After the farmers' sons have received the education that you are speaking of, do you find they go back to the land?—That depends. They do not, all of them. I should not think more than 50 per cent. of those receiving higher education, a University education, go back to the land and farm. Too many of them from my point of view take appointments, teaching, expert work, and so forth. There is rather a desire on their part to do something of that kind.

1543. And we may take it for granted that the scholarships that the Board of Agriculture would give would not

Mr.
A. D. Hall.

Mr.
A. D. Hall.
7 May, 1907.

tend to help the ordinary farmer?—They might or might not.

1544. Can you give us any illustration of this question of book-keeping. You have been asked questions that I do not quite agree with. Don't you think book-keeping in regard to farming wants to be done just as well as book-keeping in commercial life?—Quite as well, but in a different way. What I mean is this, the ordinary book-keeping by double-entry shows you the state of your cash and your liabilities, and so forth to enable you to draw a balance sheet.

1545. I wish to know rather whether a certain kind of book-keeping is not necessary showing the cost of the different experiments and whether they answer or fail?—I only want to carry him a little further than that. The only system of book-keeping that seems to me to be worth much to a farmer is a system that would answer him questions like this: What does my manure cost me a ton to make? What does my grazing land return? What have the beasts that have been fattened in the fields paid me as compared with the beasts fattened in the yard? I have bought 20 Irish beasts and fattened them in the yards, have they made a profit or not? What is my arable land producing as against my grass land? I want to see the different departments dealt with separately. A man has a mixed farm, and he has certain departments of work on it, and he can increase his acreage in one direction and diminish it in another if he finds one crop or style of farming pays better than another. I want him to keep what in a big manufactory is called a "Costs Book," which will show what it costs to produce each article of manufacture. I want to see that applied to farming. That means recasting the whole method.

1546. I am afraid that our prices and the great variation of prices upsets all calculations?—Well, it does not entirely upset them. Of course we know it makes it very difficult. The difficulty in book-keeping for a farm is that many of the operations do not show an immediate return; if, say, you are growing a root crop, you do not get your money back in the roots, and some of it has to be spread over the next three years. There are a lot of contingent operations and a certain amount of estimated figures which the book-keeper has to include, if he is going to bring out a true profit and loss account. I maintain it can be done; in fact, I see it being done.

1547. (By the Chairman.) In one of your remarks you speak of the extent to which dairying is practised, to what extent is it practised at Wye?—I have no knowledge.

1548. (Dr. Somerville.) Was it the future elementary schoolmaster who took nature-study at Wye?—They were all men actually at work. They came up and spent their holidays. They had schools, and they were taking classes in their own schools at the time.

1549. Under the Board of Education?—Yes.

1550. Do some of them aspire to teach the principles of agriculture?—You mean under the Board?

1551. Yes?—Only the first stage. They are inspected, but not examined. You see an elementary school cannot send up pupils for those examinations.

1552. But do the elementary schoolmasters never start evening classes?—They do occasionally. I think again they do not come up for examination, but go for inspection. I think Mr. Dymond can tell us what happens. I know a large proportion of the men who used to pass through our hands had these classes going on in their own schools. They are bound to have something of the kind.

1553. Then does the County Council cease to keep in touch with these men to whom they have granted scholarships?—No, the County Council is in touch through its Inspectors of Elementary Education. You see the Kent or the Surrey Education Committee would pick out the teachers that it wanted to come to Wye.

1554. And, subsequently?—They would put on some pressure if they were not making use of the instruction they had received.

1555. They are not allowed to return to their school after having spent a special holiday without giving some return afterwards?—No, the provisions of the code forces all teachers to take some subject in the nature of a science and the code says it must bear on the local requirements. I think an elementary schoolmaster has a difficulty of getting out of doing something in the way of nature-teaching at the present time, if he lives in the country.

1556. That rather assumes that no work of this kind is taught?

(The Chairman.) I must ask Prof. Somerville not to deal with that. It is rather outside our inquiry.

(Dr. Somerville.) Then shall I be in order in asking whether in his opinion agricultural education will in the future be best conducted under the Board of Agriculture or the Board of Education.

(The Chairman.) Yes, that I can allow.

(The Witness.) I wish to see all the higher education still in the hands of the Board of Agriculture.

1557. (By Dr. Somerville.) Is it not somewhat anomalous that we have a great Government Department charged with the care of education and that we should find it qualified to deal with all education except agricultural education?—Well I am not afraid of that anomaly.

1558. What is the special argument in favour of agricultural education being placed under a special Board, and all other forms be subservient to the Board of Education?—Merely the argument that agriculture is rather a special thing which stands by itself. It is an argument of this kind. Take a University College with an agricultural side; at first the idea was to put all the agricultural students who came to that college through the same chemistry classes as the budding medical student and the budding engineer, and so forth. Well, it did not succeed very well. It has been found desirable, I think, in most places, to give the agricultural student his own special classes even in agricultural chemistry. And in the same kind of way I would rather like to see the Board of Agriculture stick to the higher education, stick to its own present form of control at any rate; it helps and advises and stimulates. I fancy agricultural education would rather get lost sight of and be swamped in the manifold duties of the Board of Education. I have never found townsmen and academic people show any very intelligent appreciation of either the position or the needs of agriculture.

1559. In your experience of the methods of other countries, do you know of a case where agricultural education is not placed under the control and direction of the Board of Agriculture?—I could not be at all certain. My impression is that in France it is the Minister of Agriculture who looks after all the agricultural education of the country other than in the elementary schools; but I would not be at all sure. I am simply speaking from my impression.

1560. You have taken a great interest in the conduct of higher examinations in agriculture, and more particularly, I think, you have given some attention to the present position of the National Diploma Board?—Yes.

1561. Do you consider that there is still much need for the continuation of this independent examining body in view of the fact that all the University Colleges teach agriculture, and that the Universities with Agricultural Departments, and the special Agricultural Colleges, such as the one at Wye, are now issuing certificates of their own?—I hold the day has rather passed for that central examination. Before the foundation of the colleges, when there were private students of agriculture scattered about the country, men working by themselves, it did an extraordinary amount of good in showing them what they had to work at, and so forth. But now that practically every agricultural student who comes up for that certificate has passed through one of these teaching institutions, there is less opening for such an examination.

1562. But if effect is given to your suggestion that winter schools of agriculture or some such secondary form of agricultural education should be developed, would not the pupils of these schools desire to obtain some certificate from an independent examining body to show that they come up to certain standards?—They would find an examination like the National Diploma rather unsuited to them, as candidates have to attain a very considerable standard in a lot of subjects all at once. I take it in a winter school students would come up two or three years in succession and take the thing in bits. I think a student would be better suited by the Board of Education examination rather than by the National Diploma.

1563. You don't think the national examinations conducted by the National Diploma Board might be modified?—There is one type of student it is suited for. When you are dealing with a man who comes off a farm and he gets his scientific education, as it were, casually, and from time to time, gets it up himself, then to pass the National Diploma means he must have attained a very high standard of work. He has had to take a lot of subjects, he has had to read what to him is very difficult indeed, and he possesses already that large body of practical information and

Mr.
A. D. Hall.
7 May, 1907.

knowledge of farming which really makes the scientific work that he gets up in this fashion useful to him; so it becomes an extremely good test for that kind of man. But the mere fact that there are a lot of subjects and it is all paper work, makes it very easy for quite another type of man. The clever boy with a scholarship, who has gone into an agricultural college, finds no difficulty in passing that examination, because he has been practised in cramming up subjects quickly and setting them out clearly on paper, while there is no opportunity of testing whether he has done the work he writes about. So long as you are dealing with the more or less private student who has practical knowledge of farming, and can confine the examination to him, then the National Diploma is a good type of examination; but it is a bad one for the college-trained or the school-trained smart schoolboy who is clever at passing examinations.

1564. The Board that we are referring to, I think, for the most part consists of representatives of the two great Agricultural Societies of England and Scotland, and comprises practical farmers, men who have an intimate knowledge of practical agriculture?—Yes, I think they are chiefly representatives. I speak without any particular knowledge of the present composition of the Board.

1565. Do you consider that the examination is a good test of knowledge of practical agriculture?—No; I think it is extremely difficult to devise an examination that shall test practical agriculture.

1566. But with a Board representing the two societies which are established primarily to promote practical agriculture, do you not think it desirable the diploma of the Board should be perhaps more essentially a certificate of practical agriculture than it is?—If they knew how to examine. You see it is only a man who is engaged in teaching who really knows what can be expected from a student. It is very difficult for a man who is engaged in the practical pursuit of his own business quite to appreciate how a student approaches that subject, and what he may be expected to know. The things which to him are indispensable and commonplace the teacher may know can only be attained by experience, and they are difficult things to examine about. And for the reason that agriculture is so much a business, and the practical man, of course, is bound to put the business foremost, it becomes very difficult to devise an examination that shall run alongside what is practical in teaching. Only a teacher who has been at his work a long time knows what can be done in the college and what has to grow by actual experience on the land afterwards.

1567. So you think that this Board fails for two main reasons, first that it does not contain the best educationalists, and secondly that its examining staff is not drawn from men who are actively engaged in teaching?—I think those are defects in the constitution. I should rather be inclined to base my objection to it more widely than that. On the whole, a general examination is very difficult, and this particular general examination has now no longer the class of candidates coming up for it for whom it was originally devised. If there is to be an examination it should be devised by men a certain number of whom are in touch with actual teaching, so that they can make it flexible enough to meet the very varied requirements of the country. You see, the two types I have in view are something like this. You get, say, in Scotland, a student who has come off a farm, who is fairly grounded in the practice of agriculture; you get a good many of them coming up and taking this examination, but they do not want the same method of examination as, say, the clever boy who has come out of a town or a small country grammar school with a scholarship, a smart boy who has all the art of passing examinations at his fingers' ends and can get up a subject with great rapidity; he wants a very different type of examination, and unless you have the teaching influence represented both among the examiners and the examining body, it is difficult to devise an examination that shall adequately hold the fair balance between these two classes of pupils. With a central examination it is difficult to avoid tempting the colleges to teach for examination successes instead of for the special needs of the locality and the class of students coming to the college.

1568. I think, perhaps, I may conclude you are rather disposed to modify the view you took up when addressing the London Farmers' Club some little time ago when you said, "The only general examination that exists in agriculture—the National Diploma—sins against every canon of good examining; it is out of touch with college curricula and teachers; it insists on a multiplicity of subjects each run by a specialist; it ignores all practical

work. This examination is the most serious hindrance to the progress of agricultural education our colleges are faced with to-day?"—I should endorse every word of that.

1569. (By Lord Moreton.) You stated in reply to Prof. Somerville that the Diploma Board consisted of practical men in contradistinction to teachers. You are aware Government representatives both of England and Scotland are on that Board?—I really do not know much of the composition just now.

1570. There is just one other question I should like to ask as regards the teachers examining. Of course there is no doubt it is the ideal thing, but does not a practical difficulty arise in this: that it is rather difficult to get good examining teachers whose pupils may not be sitting for the examination?—I think that is a thing which happens in all examinations. In higher examinations at the present time you expect sometimes to meet your own pupils. But there are generally co-examiners.

1571. In some subjects, not all. We have to take that into consideration as regards examiners?—But is there any objection to a man examining his own pupils? I was certainly examined at Oxford by one of my own professors. The same thing prevails in every other branch of knowledge and in every other profession in the country, an examiner does meet his own pupils. Take the University of London which I happen to know something about. It has been reorganising its examinations, and the cardinal principle is that in every examination there shall be an external examiner and the teachers shall be associated with him.

1572. I may take it you would feel more satisfied with the examination if there were two examiners in each subject?—Oh, I think it almost necessary sometimes to have two examiners.

1573. Then I may assume that you would have considered the very considerable increase in expense that would entail to the two societies that are running the examination. You would probably prefer to see that particular examination held under different conditions, shall we say conducted primarily by the Board of Agriculture, and possibly with an advisory committee?—I feel rather that the examination is not particularly wanted in view of the University degrees that are available practically to all the large colleges now, and that there also exists the Board of Education examinations which have been of recent years recast and revised, especially as the particular solitary student for whom the Royal Agricultural Society originally devised the examination hardly now-a-days exists.

1574. (By Mr. Medd.) You have had some experience of agricultural education both in France and Holland?—I know very little of the Dutch. I have just been to one or two of their colleges, some years ago, but I do not know anything of their organisation.

1575. But in neither of these countries have you ever heard of any difficulty as between the Department of Agriculture and the Department of Education?—Well I have certainly not heard it. I should not be in a position to hear it.

1576. As a matter of fact, are you aware that in both those countries all agricultural education other than what you may call rural instruction is under the Department of Agriculture?—That was my impression about France, but I could not be certain.

1577. Are you aware of any country in which agricultural education is under the Board of Education?—No, I have no knowledge. I cannot really say.

1578. The one essential thing, of course, is that there must be complete co-operation between those two authorities?—I should say certainly.

1579. If the existing system is maintained in England and the work of the Board of Agriculture be extended there must be complete co-operation between the two powers?—Yes, certainly.

1580. Well, now, can you suggest any definite way in which the Board of Agriculture could exercise any control over the allocation of the "whisky money" to agriculture?—No, I do not know how it can be done. I do not know what powers could be given to them or how it could be managed.

1581. Is it not probable that the local authorities would resent any control of that kind being exercised by the Board?—They would, probably, resent any attempt.

1582. I quite see your point, that it is grossly unfair

that certain local authorities should allocate no portion of their "whisky money," or only a trifling portion, to agriculture. Now do you think that that difficulty might be overcome to some extent in this way, if the Board of Agriculture declined to subsidise any institution in any county the local authority of which did not submit a scheme for the agricultural education of the whole county to the Board of Agriculture for approval and advice?—But how does that touch the case? The counties that are the sinners do not come to the Board of Agriculture for any subsidies at all.

1583. Of course we are hoping that the blank places on that map may be filled up, and we are hoping that other types of institutions may be established. Now, under the present chaotic condition of things there is no system at all. The suggestion which I put to you amounts to this, that no county would receive any assistance whatever from the Board unless that county submitted to the Board a scheme for the whole agricultural education of that county; that would be tantamount to the same proposal as yours, only it would work differently. The result would be the same. It would entail the submission of a definite scheme by every authority on application for aid. At present the Board is only, so to say, cognisant of the operations in that institution and not by the area served by the institution. Do you see the difference?—Yes.

1584. My point is this. Take the County Councils of Kent and Surrey, they are generally responsible for Wye. Under the existing conditions those authorities have not to give any account of the general agricultural education of these counties, but merely of the operations of Wye. I wish in future that those local authorities should have to explain to the Board the whole agricultural provision of the county, that the general scheme leading from the elementary school up to Wye is a condition precedent to any grant to Wye?—I do not quite see how it would work. Take the county of Hertfordshire. The county of Hertfordshire gives a small subsidy to Cambridge. You would practically say to the Cambridge Board, "We won't subsidise you unless the county of Hertfordshire, which is one of your contributors, submits its whole scheme to us." Are you not penalising the wrong people?

1585. No, I think not. Because we found the relationship of these affiliated counties to Cambridge is of the slightest description. Cambridge has no idea what is happening; it gives no advice; its Board has no control. My suggestion to you would entail a definite scheme for each affiliated county as a condition precedent to assistance to Cambridge. If Hertfordshire declined to submit a scheme, Hertfordshire would fall out?—Quite so. Hertfordshire would be likely to say, "If we are going to be under authority like this because we make a contribution to Cambridge, we won't offer it."

(Mr. Middleton.) If any such arrangement was proposed to Cambridge, we should say that we could have nothing to do with it.

(Mr. Medd.) You would lose the grant. But what I am endeavouring to explain is an initial step towards a system under which the Board of Agriculture would have some control, as Mr. Hall suggests, and also a power compelling the authorities, if they obtained it, to submit schemes.

(Mr. Middleton.) Then you must compel the counties who have the money.

(Mr. Medd.) Those institutions are in some cases the creation of the local authority, at any rate they are governed by the local authority.

(Mr. Middleton.) There are some institutions through which you could hit the counties, there are other institutions which would not affect the counties.

1586. (By Mr. Medd.) I take the case of Harper-Adams which, I think, has Staffordshire and Shropshire affiliated to it. Those two counties when applying for the grant for Harper-Adams for this year submit to the Board a detailed scheme of all agricultural education provided within their respective areas. Shropshire sends such a scheme, Staffordshire declines; then Staffordshire at once loses whatever advantages it has by affiliation to Harper-Adams?—I think that would rather tend to penalise the wrong people. Suppose a county was granted its share of the "whisky money," assuming you could arrive at what ought to be the share of agriculture, my idea was that if the county does not spend it, the Board ought to have some power of veto and say, "You shall not have it."

1587. My question originated in the endeavour to find how the Board could exercise the control you have in your mind. Now in reference to another subject in your *précis*, you mention three or four types which have been proved by experience; you have referred to the advanced college and to the winter schools. Now what other types do you suggest?—I think the types I had in mind were the colleges of university rank which may be either a department of a university college, or a residential college, then the school which has a parallel in the *école pratique* such as the Cumberland schools and the Bedford schools are types of; and the winter school, of which the Chelmsford is a type.

1588. In your Address at the Farmers' Club you used the term "farm school." You do not, of course, mean by that a "*ferme école*"?—No.

1589. You mean a school of the type of the *école pratique*?—Quite so.

1590. Do you think it possible to combine a school of that type with an advanced school, that is to say, could Wye incorporate a school of intermediate agricultural education for pupils from the age of 13 or 14 to the age of 16 or 17?—No, I do not think you ought to run the two together.

1591. Then you do not think that agricultural sides attached to secondary schools are good?—As far as they are trying to teach agriculture I do not think they are good from what I have seen of them.

1592. In your evidence before the Departmental Committee on Training Colleges in 1901—you were Principal of Wye then—you suggested a third year's course for teachers at Wye and you drew up a scheme, did you not?—I believe so.

1593. You still think it would be possible to provide a third year's course for selected teachers?—I think it could be done if a sufficient class was got together.

1594. Are you aware that such a scheme is now being drawn up at Wye?—No, I have no special knowledge.

1595. Then with regard to courses which you inaugurated at Wye, do you not think a course held on Saturdays throughout the year is likely to prove more useful than a short course of a fortnight at a time?—I think the two ought to go on together. You want your course at the college. It is only there you have your teaching plant, and you cannot bring students to the colleges on Saturdays throughout the year, the distances are too great.

1596. That difficulty has been overcome. They have had them continuously on Saturdays at certain centres. But apart from that, don't you think it an advantage to the teacher if he has an opportunity of studying agriculture or horticulture at all seasons of the year, so that his lessons may be appropriate to the particular season of the year?—Oh yes, there is a great deal in that: but not such a gain as would appear on the face of it.

1597. Now in your Address at the Farmers' Club, you drew attention to the really large amount of money which is expended upon agricultural education out of the "whisky money," and you referred to the amount wasted, can you kindly tell the Committee the directions in which you think there is a useless expenditure of money now, "a frittering away," you call it?—I think from the point of view of agriculture a great deal of the county expenditure—I think it has been mitigated of late a little—but still a great deal of the expenditure on teaching cottage gardening is rather a waste of money, and should not be regarded as expended on agriculture at all. A great machinery, as it were, has grown up for teaching horticulture to allotment holders all over the country, a machinery which is stimulated by prizes and awards for attendance, until the success of the work is a little bit fictitious. It all adds to the amenities of the country and helps the labourer to make a better living and so forth, but it is not agricultural education. There are a good many of these small classes which cost quite a disproportionate amount of money. In all cases I rather believe in trying to educate the master and leaving the education of the man in his hands. I do not think very highly of many of the practical classes that have been established in different parts of the country for matters like thatching and brushing hedges, and various operations of that description. I doubt if educational money ought to be spent on such matters. We have not much money to spend on education, and I want to see it

concentrated where it can tell most for the advancement of the industry.

1598. Then what would you suggest as the best organisation for a county working from the elementary school—putting that on one side—up to the collegiate centre, what kind of instruction would you supply as most appropriate for farm lads and young farmers working up to the collegiate centre?—I should, of course, want to see the nature-study carried on properly in the elementary school. And I think the continuation school ought to continue that form of work and get it more specialised. But so far as building up a ladder of instruction goes, I think that is to be done entirely by continuation schools with winter schools for short courses available for those who are wanting them. You see in any village which I know, at any rate in the South of England, the actual number of people engaged upon the land is but a small proportion of the residents in the village, and you cannot arrange the whole of the teaching for them.

1599. Then you referred incidentally to the Departmental Professors of Agriculture in France, and the good work they did in their several Departments, do you think it would be an advantage if England were mapped out by the Board of Agriculture and definite agricultural officials appointed under the Board for such area?—No, I think those men ought to emanate from the collegiate centres. I do not think you can lay down any definite rules as to their number or duties, but the Board of Agriculture in administering these grants to colleges at the same time gives advice, and if it put a certain amount of pressure on the colleges to strengthen their organisation in that direction, it would best help matters.

1600. You would not have those officials in any way subject to the central authority?—No, I want to see them working for the colleges and responsible to them.

1601. If you dislike the central examination, don't you see some difficulty arises from the various standards of the existing examinations; that, if each institution is to conduct its own examinations, there must be some difficulty in determining a standard?—Well, isn't that a difficulty that is inherent in life? Every university grants a M.A. Degree, but the value of that M.A. Degree has to be determined afterwards. No examination can guarantee that a man reaches a certain standard or belongs to a particular class, it can only ensure that he has been through a proper course of training.

1602. But don't you think some good might be done if the Board of Agriculture were to differentiate distinctly between grades of institutions, so that a place like Holmes Chapel should not be classified as of the same grade as Cambridge University?—Well, it would lead to heart-burning and trouble.

1603. But in the interests of education?—I don't think it would help matters at all if the Board labelled them. A college or an institution does not depend upon its label it depends upon the men it turns out.

1604. Have you considered whether an examination of the type of the Institut National Agronomique would be a good type of National Examination?—I do not think it would unless you first get the institute to prepare for the examination.

1605. But if we had an institute of that type, it would be a fitting body to hold a central examination?—Then I should say again that the education should be a necessary preliminary to the examination.

1606. Then in regard to experimental work, do you believe a central committee to collate and advise upon the experimental work of the country, provided with funds to promote it, would be an advantage?—You are speaking of experimental work, in what sense—in the sense of research or what?

1607. In the sense of research, and the experimental work now conducted at various institutions. At present as I take it, each institution works alone. I merely suggest a central council or committee which would collate the work and under the authority of the Board be able by subsidies to promote it, and so forth, and bring each isolated part of the work into line?—If it has a sum of money to subsidise research with, I can see the committee might be very useful; if the proposed committee is going to try to organise the research, I think it would be mischievous. It might prevent overlapping and do good in that way, but its function should be to assist any good work going on. In the end research is done by individuals and not by a committee.

1608. (*By Prof. Middleton.*) You expressed an opinion

that agriculture was out of place in secondary schools?—Yes.

1609. You spoke as an examiner?—I spoke partly as an examiner, and I have been invited occasionally by the Board of Education to inspect.

1610. You have direct knowledge?—I have seen and inspected some of these schools, and I thought the less they do of agriculture the better—actual agriculture, I mean.

1611. You referred to your experience of the change of front on the part of farmers, and you have explained to us that when the scientific man knows what it is the farmer wants, that the farmer will come to him for information. You find no difficulty in getting at the farmer?—No difficulty in getting at the farmer when the farmer learns that the scientific man is not trying to teach him his business, but only to help him. They have to meet one another.

1612. That is your general impression?—I think you can see it all over the country.

1613. You said that your staff was adequate, that you had a sufficient number of men?—At the time we had an adequate staff.

1614. Was there any difficulty in keeping the staff together?—Well, our staff kept together for some six or seven years, and then it nearly all dispersed in a year or two. I think there is only one member of that original staff left at Wye. Speaking as a Governor of Wye, I see very rapid changes in the staff going on now.

1615. That is a difficulty which will tend to disappear, you think?—Quite.

1616. You referred to the value of open scholarships, your idea was to get men to come from other counties, I think?—Yes.

1617. Do you think that an open scholarship given after a high test would be likely to bring many students from other counties?—No. It might bring one or two, that is all. You get an occasional man who would be well suited by the place.

1618. As a matter of fact, do many County Councils permit their county scholars to choose?—Many counties which have no institution of their own do that now.

1619. Even those which have institutions in their own district would permit a choice?—That I have no experience of.

1620. You referred in some detail to the teaching of book-keeping, and you said the subject was treated too theoretically?—It is treated as if the farmer were going to be a banker.

1621. That is to say, he gets a course of instruction in the general principles of double-entry?—And it leads to nothing.

1622. Is not the great difficulty that the course is too short, and just when it ought to lead to something they stop?—All these courses are too short in that sense. But if you try to work too long on principles without seeing the application you won't get your students to follow it out.

1623. The great difficulty, as I understand it, is that you scarcely have the time to get the principles?—Well, I suppose most of the scholars put in a couple of hours a week for two years on book-keeping. The subject wants a good deal of time, depending on your material, of course.

1624. You would agree that for a farmer's purpose it is very necessary he should have thorough grounding in the principles of double entry book-keeping, or would you not?—Well certainly the principles of double-entry. I think all specialised book-keeping in the end depends upon a disguised double entry. I do not know that it need take the form of double-entry book-keeping, because in some forms it would not involve a ledger, but an analysis book. My point is rather this. You get the ordinary book-keeping examples, and you find the student is worried a great deal by questions of Bills and Discounts and things of that kind which do not come within the experience of the farmer; whereas such a vital point as the allocation of his labour is not dealt with at all.

1625. Of course points like allocation of labour and different systems of feeding, these things would be dealt with in ruled books?—That is it. You want to deal with that kind of thing very early and not get into the way of putting down feeding stuffs consumed among the losses.

1626. It really means the farmer must have sufficient grounding in the principles of book-keeping to be able to use his ruled books intelligently?—I will put it like this:

Mr.
A. D. Hall,
7 May, 1907.

Mr.
A. D. Hall.
7 May, 1907.

I do not think our men who are teaching book-keeping have ever set themselves to look at book-keeping afresh, from the point of view of the farmer. We know the principle which lies at the basis of all book-keeping; let us see if we cannot construct something which applies directly to a farmer.

1627. I think that is done sometimes, I think such books have been constructed?—I know there are a great many of these farm-account books. I have seen a good many of them, but they hardly meet my point.

1628. (*By Mr. Latham.*) May I ask one further question. I notice what you said about the outside examiner. Having had considerable experience in that, I should like to know why you look upon the outside examiner as a failure?—I do not look upon him as a failure, but he sometimes fails to appreciate the difficulties of a student. He looks at them from his own point of view. As principal of a college, I have had to do with different external examiners. They are as different as possible. You get one man who is exactly what you want; he is a good practical man, and he realises the sort of stage in his knowledge of farming the student is likely to be in and what kind of things he ought to know, and he can cross-examine his students, set the right kind of questions, and he will look for the right kind of information. Another man may be just as good a practical man, but for want of that appreciation of where the student is in his knowledge he makes a very bad examiner. I do not say it is confined at all to farmers; it is just as manifest in chemists. If you get a distinguished chemist to set an elementary examination, he will often set a very bad one indeed if he has not been doing any teaching or been in contact with students and knows the position they ought to be in.

1629. You do not look upon the outside examiner as a very useful adjunct?—That is it; he is an adjunct. That is what I want to see. I want to see the two together. Your outside examiner must be there to keep the examination in touch with the real thing; but I want the teacher to be there also to keep the outside examiner from asking things which a student ought not to be expected to know, and also to put the outside examiner up to some of the dodges of the student, because the student has his dodges too.

1630. Is it not a fact that the outside examiner generally submits several questions he is likely to examine the pupils upon, so that the teacher can have an opportunity of seeing whether they are proper questions? I think the teacher is altogether out of place and the outside examiner would be better without the teacher?—There I simply differ. I want to see them working together. I do not say necessarily the particular teacher, but I say a teacher.

1631. (*By the Chairman.*) I suppose you would be quite satisfied with regard to winter schools if an examination were held at the end of the course?—I think a certificate that the student has been properly through the course is sufficient for the purposes of the school. The student himself may be anxious to obtain some external distinction.

1632. The object of an examination is obviously to find out what the student has been taught, and what use he is able to make of it—to elicit that information?—Yes.

1633. Obviously the examination must be conducted by the people who have taught him in the first instance?—They must have a voice in it.

1634. They are the persons qualified to elicit what is the amount of information he has gathered. I take the Scotch view of the question, that the only examination which is worth anything is the examination which is conducted by the teachers, because they are the people who can find out what the man's qualifications are. It is quite obvious that with an external examiner the thing becomes quite haphazard. On the other hand there is no objection to the external examiner being present to see that the examination is being properly conducted. Your point is that the main object of the examination is to elicit what is the result of the teaching?—Exactly.

1635. You take that view?—I take that view entirely.

1636. You also take the view that in the present condition of agriculture and agricultural education we must not attempt as yet to systematise or over-centralise; you are in favour of leaving as much as possible to local initiative?—I feel that very strongly. The organisation wants to be very flexible.

1637. (*By Mr. Middleton.*) You have had a long experience as a teacher, and I should like to ask you this: Do you think it is a great advantage for a man entering an agricultural college to have had some training in practical agriculture beforehand?—I have never been able to make up my mind on that subject yet. I have often thought of it, but I cannot say even now that I would lay down a general rule. It depends entirely on the individual. There is a certain type of boy who does not settle down to work until he is about 18 or 20, and to have roughed about a farm and to know what to begin to work at is of enormous advantage to him. There is another type of boy to whom it is important that you should not break the continuity of his book work. I would not attempt to lay down any general rule as to whether the practical should come first or that the college should come first.

1638. Is it not the case in Germany that the tendency is rather for the agricultural student to get his practical training first, and also in the case of engineering students in this country?—Yes. Does not the residential college try to do that? I could quote cases both ways which have worked well.

1639. That was really my reason for asking you. I was wondering whether you had come to some general conclusion?—I think it depends upon the strata from which you draw your students.

(*The Chairman.*) Thank you. I am sure the Committee have appreciated the very interesting evidence you have given.

Mr. THOMAS COPE, called and examined.

Mr. T. Cope. 1640. (*By the Chairman.*) You are Chairman of the Leicestershire Education Committee?—Yes.

1641. And you are also chairman of the governing body of the college at Kingston?—Yes.

1642. Could you give the Committee some information as to the origin and formation of the Midland Agricultural and Dairy College?—Shall I tell you shortly how we came into being.

1643. Yes?—When this technical work first began we endeavoured to give instruction by lectures. We found that the instruction by lectures was by no means satisfactory. To a certain extent it was useful for butter-making, but when it came to cheese-making it was no use at all. Therefore Leicestershire had the honour of calling together representatives of the neighbouring counties to see if we could form a combination of the different counties so that we might work together. We succeeded in doing that, and we were lucky to secure the co-operation of Nottingham, Derby, and the Lindsey Division of Lincolnshire, and in 1895 the Duke of Devonshire did us the honour of opening our College. That is when we started. Then in the year 1898-99 we transferred

the agricultural department from the Nottingham University to Kingston. I might explain that previously there had been an agricultural department connected with the County Council of Nottingham, and we to a certain extent co-operated in that. Then it was found it would be better if the agricultural department was transferred to our college at Kingston, and that was done in 1899. It necessitated the erection of new buildings, lodgings for the students and things like that, and those buildings were opened by Mr. Walter Long in the year 1900. Then almost immediately we found very considerable pressure upon our accommodation, not only for the accommodation of the students, but also for the lecture-rooms; and in the year 1902 we decided to extend, and we obtained further grants from the counties for the extension. In 1903 we had already commenced the extension when a somewhat opportune fire occurred in a large barn which we had fitted up as well as we could for the purpose of dairying and matters of that kind, and therefore we were enabled to make a very much better extension than we otherwise should have done. That wing was entirely modernised, and now forms, I think, an exceedingly good place for our

Mr. T. Cope.
7 May, 1907.

- 1643a dairying work. Then in 1904 Sir Thomas Elliott did us the honour to open our extra buildings. That brings us nearly down to the present day, but I might say that at the present time we still feel the same pressure upon us.
- 1643b Whatever we do we seem to be caught up, and latterly our agricultural work has increased very considerably. To begin with, we put our whole strength originally into the dairying part of the business, and we have done exceedingly well with that. But of late years, we have gradually increased the agricultural work, and that has been growing upon us, so that now we are in the position, as I say, of really having considerable pressure upon our accommodation. Then I should like to say this: that we have had a certain amount of difficulty with regard to our finances because, while the capital payments and the current payments made by the County Councils are stationary, our work has really been constantly progressing, and I think we do it better. For instance, we have now a large laboratory, and we are able to do more laboratory work than we used to do with regard to agricultural chemistry. Then we have also done some good work with bacteriology, which, of course, has a most important bearing on the fermenting of cheeses. Then we have also increased our work in poultry-keeping, horticulture and bee-keeping. And then I do not think I should be wrong in mentioning that in order to make our dairying work complete, Lord Belper was good enough to give us the plant for cold storage. That, of course, has added a great
- 1643c completeness to our work. Amongst other courses we have courses for factory managers, men who wish to make it their business in life to carry on these things on a very large scale, and for that purpose the cold storage is a most important part of our equipment. Also we have added woodwork shops and ironwork shops, and in fact we are always adding something. Quite recently we have put up the electric light. Naturally enough there is, and always has been to a certain extent, rather a trouble with regard to our finances. And I am bound to say that from the very first the County Councils have co-operated very generously, and in the early stage when it was merely a question of their contributing out of the "whisky money," then there was no difficulty at all, because we had not to come on the rates for our work. Now that the Act of 1902 has become law, the matter presses more severely on the counties, and although I think our county does the work of education perhaps as cheaply as any, that is to say, we have a sixpenny rate for the primary education and only a penny for the higher, at the same time I have noticed a slight disinclination to again approach the counties for further grants out of the rates. And of course, my Lord, you know there are constantly coming more and more claims on secondary education, and therefore it becomes increasingly difficult for the counties to find further money. With regard to this matter of technical education, I do not know whether you would care to know the subscriptions given by the different counties at different times, I mean the capital subscription. The counties of Derbyshire, Leicestershire and Nottinghamshire originally subscribed £2,000 apiece, and the Division of Lindsey in Lincolnshire subscribed £1,000. Then in the year 1900, when the agricultural department was transferred, we obtained a further capital grant of £300 each, and the Lindsey Division also gave £300. In 1901, the three counties I have mentioned subscribed a further sum of £400 to carry on the extension which was taking place. In 1903, in order to meet the alterations which had been necessitated by the fire, and to add to our insurance money so that we might do more than merely re-build, the three counties subscribed a further sum of £300, making for those counties a total capital sum of £4,000, while the Lindsey Division contributed £1,300. That is really all the capital expenditure that we have had to go upon. I do not know whether there is anything further with regard to the work we do. Any particular details will be referred to by Mr. Blackshaw, the Principal of the college. But I might
- 1643d shortly state that we have for some time past given 6 weeks' courses of instruction in dairying, and 10 weeks' courses of instruction have been found very useful for the sons of farmers and others who have not very much time to spare, and we have graduated those courses so that a farmer's son could at intervals come for 10 weeks and take a different course each time. By coming at different times he gets 30 weeks' course, and we are able to give him sound practical instruction in that way with the least possible derangement of the farmer's work. We found at first considerable difficulty because farmers were naturally not willing to let their sons come to our college in the times when they were wanted for harvest. Very often the able-bodied sons and daughters work at home and help their fathers, therefore these 10-week schemes were provided to meet this, and we find them work very satisfactorily.

I am glad to say we have an increasing number of the very class we want to get at, that is the sons and daughters of the farmers. Besides those courses of 6 weeks and 10 weeks, we have a factory managers' course of 9 months, and that really is taken advantage of not only by those who go in for factory managers, but also we have had some of our pupils who go out to the Colonies and start teaching and agriculture out there. Latterly we have had besides, a two years' special course for those who wished to do more work in agriculture. For those who wish to have a more complete course—but there are not very many of them—we have made arrangements with the Leeds University to send students there to take a higher course in agriculture than we should be able to give. Of course you know the Leeds University has exceedingly good appliances for teaching chemistry and bacteriology, rather better than we have. We, on the other hand, I think, have more perfect equipment with regard to dairying. So we came to an arrangement by which if any of their students wished to have a more complete dairying education they might come to us, and we in our turn, if any of our students wanted a more complete scientific course than we were able to give, we could send them to the Yorkshire College. That, I think, gives precisely the general aim and objects of the way in which we are carrying out our work.

1644. Are the three counties who have taken a share in this work equally interested in the work?—I quite think so, to a certain extent. At first the students came rather more slowly from Leicestershire, but latterly, I am glad to say, they are coming rather more frequently, and I should like to emphasise this—it is rather an important point from the point of view of the Board of Agriculture—that we take students from outside the contributing counties who have to pay considerable fees, and we have had a very considerable number of them, especially at first, before the work became known in our different counties. And that is one reason, of course, why the finances are apt to get restricted, because you see how the capital contributions of the different counties are more and more taken advantage of and taken up by the counties; so of course we have not the same number of places to give to outsiders. The outsiders pay very considerable fees, and they really pay for their tuition. The more county work we get the more we are carrying on what we started for. But the great difficulty is with regard to finances. We have done a great deal of this work for outsiders generally.

1645. Are the four counties represented on the governing body?—Yes, they are all represented; they send three representatives apiece, except Lindsey, which only has two.

1646. Are you satisfied with the grant you get from the Board of Agriculture?—That is rather a difficult question, because, as I told you, we really are rather pinched for money, and we should very gratefully receive anything more you could give.

1647. You find it difficult to raise the money you want by the rates?—Yes, we do indeed, and I am afraid it will be increasingly difficult.

1648. (By Lord Belper.) With regard to the finances, I think you will agree with me that we have never spent money in enlarging the institution, or in any way adding to the expenses, until we were justified by the requirements?—That, of course, is so. We have really only done it on pressure. We have been constantly under pressure.

1649. In that respect we have been as economical as we could, because we have been obliged to justify to our counties, who have given a considerable grant to the institution?—That is so.

1650. Then with regard to the farmers. Of course you will agree with me that this college was started in this instance for the benefit of the farmers in the counties.—No doubt.

1651. What should you say with regard to the feeling of the farmers towards the college when the place was first started, and the farmers had their attention directed to scientific and agricultural education?—I should say there is a gratifying change. They certainly take much more interest in the work of the college now than they used to do, and in my own county they are coming in increasing numbers, and altogether I think the whole matter is really progressing very satisfactorily. We have certain centres for experimental work. And that no doubt is arousing interest among the tenant farmers, and with these experimental plots we have been in the habit of giving lectures. In the first place, we send down a

Mr. T. Cope. lecturer when the crops are at a certain stage, and he explains the object of these experimental plots. And then at the time when the crops are being lifted they come again and give other lectures, stating the results of the different experiments that have taken place throughout the county, and so the farmers take a great interest in these matters, and everything of that kind tends to help the institution, gets it better known, and we are better able to get more pupils. In fact, where we have given lectures we have nearly always found an extra crop of students come from that particular place.

1651b

1651c

1652. I think generally you will agree with me that when the college was first started the attitude of the farmers was rather hostile, and the opinion amongst them was that they had very little to learn from taking agriculture?—I should hardly call it hostile; it was certainly very passive.

1653a

1653. I think it has been brought home to them in some cases by some advice that has been given them when they asked for it, and in other cases when their sons and daughters have been at the college, that there is a great deal that they can learn from science as applied to practical agriculture, and lately they have shown a great interest in the work of the college?—I have been gratified by practical examples of that. I remember a farmer from Lincolnshire coming up and saying he must shake me by the hand, and how his daughter had done exceedingly well. They had never made more than 8d. or 9d. a pound for butter, and now they made 13d. and 14d., and they had obtained prizes. Then there was another farmer close to me whose cheese had done rather badly. He came to us for advice, and he was able to get afterwards quite a satisfactory price for his cheese, and it had improved in quantity as well as in quality. So one comes across concrete examples of that kind which are always very gratifying.

1654. With regard to students who come to the college, have you figures for the different years?—Yes. For the year 1896 there were 134; 1896-7, 188; 1897-8, 144; 1898-9, 177; 1899-1900, 154. Then we had the transfer of the agricultural students from Nottingham, and in the year 1901 the numbers went up to 217. Then in 1901-2 there were 282; 1902-3, 292; 1903-4, 316; 1904-5, 302; 1905-6, 337; and then this year, 1906-7, we have got a record number of 425.

1655. Those figures are not the actual number of students there at one time, but they are calculated on the classes?—They are calculated on the different classes.

1656. As a matter of fact, although we have been developing the college in order to be able to give the education we are giving and to take in more students, at the present moment we are perfectly full, and we have every prospect of requiring more accommodation than we have?—Yes, Mr. Blackshaw will tell you he has already more students' names down than we have room for.

1657. With regard to the dairy, that was in the first instance the object with which the college was started?—Yes.

1658. And we aim still at giving the highest possible education in dairying that can be got in this country?—No doubt that is so; we have made that our speciality.

1659. Not only in all forms of butter-making, but, I think, the teachers of the college make the best cheese in Europe?—I think so.

1660. With regard to the grant, we get an increased grant this year?—We have a grant up to £800 from the Board of Agriculture.

1661. But we still have a hope we may receive more in the future?—Yes, we live in hope.

Mr. J. F. BLACKSHAW, Principal of the Midland Agricultural and Dairy College, Kingston, Derby, called and examined.

Mr. J. F. Blackshaw.

1662. (*By the Chairman.*) Will you give the Committee some information about the amount of capital expended by the counties in establishing the college?—The amount of capital that has been expended by the counties in establishing the college is, in the case of Leicestershire, Nottingham and Derbyshire, £4,000 each, and of Lindsey division, £1,300. That was not all spent at the outset. To begin with, a contribution of £2,000 each came from the first three counties and £1,000 from Lindsey; the remainder of the capital has been spent from time to time as the increase in the work and the demand for extra accommodation necessitated it, totalling £4,000 each in the case of three counties and £1,300 in the case of Lindsey. That capital not only represents what has been spent in buildings, but also the equipment of those buildings as regards apparatus, and the stock on the farm, including the live stock.

1663. In addition to the capital you mention, there are favourable conditions under which the farm is leased which should be taken into account; that is, the farm attached to the college and the rent paid for the farm?—The farm is leased at 27s. per acre.

1664. And the house inhabited by the Principal, how was that built?—That was built by Lord Belper, the landlord, and the governing body are the tenants. I should have explained, in speaking of the capital, that we have a much larger establishment than the amount of capital expended might lead you to believe. In the first place, the governing body's object has at all times been utility as regards the buildings rather than outward show, and the result is you find very plain buildings, but once you are inside I think they are very well suited for the purpose for which they are intended. Also, the governing body obviated expenditure of capital by leasing the land and by having the most generous landlord, who has himself put up a considerable portion of the buildings and leased them to the governing body. That applies particularly to the remodelled farm buildings and to the Principal's house.

1665. What are the annual grants made to the college by the County Council?—The annual grants made to the college are made under two heads: first, to the in-college work; and, secondly, to the out-college. To the in-college work each of the four counties gives £100 towards the instruction in agriculture, and three counties, namely Notts, Derby and Leicester, make an annual grant of £400 a year

towards the in-college and dairy instruction. I should say, according to their agreement, they are to contribute £300 each; but it was found some two years ago that £300 per annum for the dairy was not sufficient, and consequently the counties agreed to increase for a time their annual contribution by £100, making it £400 per annum. Lindsey contributes £200 per annum to the dairying, being only a half partner in the dairy instruction. In agriculture Lindsey is a full partner, but in dairying she is only half partner. So we get £400 a year from Notts, Derby and Leicester, and £200 from Lincolnshire. As regards out-college work, each of the counties is supposed to contribute at least £100 per annum towards lectures and experiments. The amount they actually contribute varies with the different counties. Nottingham has been in the habit of granting £300 per annum for lectures and experiments, exclusive of travelling dairy school work. Derbyshire, as a rule, has given £450 or £500; Leicestershire from £100 to £200; Lindsey varying considerably, from £200 to £400. I have the actual amounts granted in the different years if you would like to have them.

1666. Dairy instruction is always given at the central institution?—We have a travelling dairy in addition to the instruction at the fixed school. The two counties of Notts and Derby employ a travelling school during the summer months, from April to October, for butter-making and soft cheese-making only. The cost of that is additional to the figures I have mentioned.

1667. And that instruction is given by the teachers of the college?—That is given under the direction of the college.

1668. Are there any local committees in the counties in order to increase the knowledge of the institution?—Well, although there are not any actual local committees officially appointed, I should say in that connection I take every opportunity I possibly can get of consulting the Chambers of Agriculture or the County Agricultural Societies so as to get them interested in the work we are doing; but there is no actual committee which exists for that purpose.

1669. (*By Lord Belper.*) The agricultural societies are in touch with the college?—Yes, but at the present time we have not actually done any work through them, beyond informally laying the work before them.

1670. (*By the Chairman.*) What privileges do the

counties receive in return for the grants made?—The grants they make must not be looked upon as maintenance grants. They are in reality a guarantee of fees, in that we have to work for them. We may be called upon to return work to the extent of the whole of the grant made. For the in-college agricultural grant each county is entitled to 150 weeks' free instruction, which they give out in the form of scholarships. For the dairying, the full partners, that is Notts, Derby and Leicester, are entitled to 184 weeks' free instruction, which is equivalent to four scholarship students in each six weeks' course that is held during the year. 184 weeks is their full privilege. And in addition to the privileges under the two grants, residents in the contributing counties coming without a scholarship come at half rate. For instance, if they were coming for dairying, the charge for instruction would be 10s. a week as against £1 a week charged to anyone coming from outside those counties. That privilege is unlimited as regards numbers. Beyond that, residents in the county have the option of seeking the advice free of charge and any other information which can be obtained from the college; that is all in recognition of the grant. Out-college grants are recoverable as follows: they may be taken in either lectures or field trials, what we commonly term experiments, the lectures being charged at a fixed rate, whether agricultural, horticultural or veterinary lectures. Field trials are charged in the same way. They are all done at fixed rates, and so long as the county does not exceed the value of the grant there is no charge made; but if the value of the work done exceeds the grant made, then the county is assessed for the balance.

1671. I suppose full advantage is taken of those privileges by the counties?—Full advantage has been taken of them, particularly during the past and present year. At first full advantage was not taken of the privileges by any means, but year by year it has been creeping up, both as regards the in-college privileges and the out-college work, until now they take the fullest privileges it is possible to get, and the result of that is the finances of the college are getting more crippled every year, because whereas at first when they did not take full advantage the remainder of the grant was left in our hands and we annexed it, but now they take up the full value of the grant and the result is we have not that surplus.

1672. Are the lectures well attended?—They are. On average, I think, works out between 30 and 40 per centure. But what is still more satisfactory is that the numbers are made up of men who are really interested in the lectures, who really come to learn and not to criticise in the manner that was the case in the early years.

1673. The lectures are attended by farmers?—Yes, and men who come with the intention of gleanings information if it is possible to do so.

1674. The lectures are not attended by labourers?—In some cases they are, especially allotment holders.

1675. But the main attendance is farmers?—Yes.

1676. Perhaps you will give the Committee some account of the courses of instruction which the college provides?—Well, first of all, there is the agricultural course, which up to last year consisted of three terms of 10 weeks each, each term being progressive on the previous one. A student might attend the first term, and if it was not convenient to come to the second that year he could postpone coming until the following year. Last year the governing body decided to establish a two years' course, that decision was come to in consequence of several applications for a longer course in agriculture. The applications were from residents in our own counties who would not go elsewhere, so a two years' course has now been laid down. In dairying we have three courses. We have what is called the diploma course, which is of 36 weeks' duration, and is intended for those who wish to gain a fairly clear insight into not only the theory, but the practice of dairying. The students come to the college in October and take practical dairy work every morning during the course, and the afternoon from 12.30 is occupied in attending lectures and laboratory work, special attention being given to dairy chemistry and dairy bacteriology. Then we have the factory managers' course in dairying, a course intended to equip young men with a knowledge of the management of a dairy factory. That course was put on in consequence of numerous applications for such men, coming more especially from co-operative dairies—where farmers have co-operated and established a dairy in a certain district to suit those farming within the range of that centre, and they want a competent manager—I say that that course was put on to provide managers, thoroughly equipped both as regards theory and practice. Then there

is the six weeks' dairy course, that is the course intended for farmers' sons and daughters who cannot be spared for a long period, and we have large numbers attending those short six weeks' courses. Of course they are mainly for instruction in practical dairy work. They may take either butter or cheese making, or both. We do not encourage them to take too many things. They can choose the class of cheese for themselves according to what they wish to do at home. And in the afternoons they have courses of instruction in horticulture, book-keeping, veterinary science so far as it affects dairy stock, and poultry keeping. Then we have special courses in dairying which deal really more especially with dairy bacteriology. We have teachers and others coming to us to rub up their knowledge in the various branches, according to what they are specially interested in, but as a rule, it is for special instruction in dairy bacteriology, of which the college makes a speciality. The only other course I need mention is the nature-study course for rural school teachers. We have had for several years in the summer months three courses of a fortnight each during the months of July and August, and they are attended by the masters and mistresses of the rural elementary schools, the first course being for males, the second for females, and the third for males. During those courses instruction is given in nature-study generally, but I always make it a special point to inform them as to the objects of the college, what is being done as regards agricultural education, how it is done, and what the results have been. I do that because I am very desirous that they should have that knowledge, so that on going home to the parish they represent, they can give the information to the farmers in their district, and I have known very great benefits accrue from that. These schoolmasters become very interested in what they are doing. They go back most enthusiastic, and explain to the farmers in the district what is being done, and as a result of that many students have come to the college, who otherwise would not have known about it. Those are the chief courses we have at the college.

1677. Are there different courses in agriculture?—There is a one-year course and a two-year course.

1678. What is your staff?—Besides myself there are two lecturers on agriculture, one whose work is confined to in-college work, and the other is mostly engaged in out-college work. Then in dairying there are two instructors for practical dairy work. In chemistry and bacteriology there is Mr. Golding and his assistant. Agricultural botany is taken by the out-college agricultural lecturer. Agricultural entomology is taken by the lecturer on agriculture. Then we have a veterinary surgeon to take the veterinary science. We have an instructor in poultry-keeping who manages the practical poultry department and gives such lectures as the college requires. Then there are the lectures in horticulture. We had two instructors until quite recently, but one died a few months ago. His position has not been refilled at present, so for the moment we have only one; but as a rule there are two for the most part confined to county work. We have fruit and vegetable plots in Derbyshire, and the instructors go round and give advice to whoever requires it. Then in nature-study we have Mr. Thornley, assisted by other members of the staff. Then we have an instructor in bee-keeping, another in land surveying and mensuration; a man for iron-work and a man for wood-work. Then we have a farm steward who manages the practical farm students. Those are the members of the staff.

1679. Is there any instruction in book-keeping?—Yes, that is given by the lecturer on agriculture. The branches covered are agriculture, dairying, chemistry and bacteriology, agricultural botany, agricultural entomology, veterinary science, book-keeping, poultry managing, horticulture, nature study, apiculture, surveying and mensuration, iron and wood workshops, engineering, and practical farm work.

1680. What further extension do you think is most needed?—Most of the departments I have mentioned need extension. For instance, in the chemistry and bacteriology, we require additional accommodation. Our space is exceedingly crowded at the present moment, and that might apply more particularly to the laboratories. The space there is becoming insufficient for the number of students applying for instruction, and unless we are to cut off the numbers, extension will have to be made in that department, both as regards accommodation and assistance in order to give instruction. Then in poultry management, I quite think it is possible we shall require another instructor, because we are getting

1680b

more than we can do, both as regards in-college and out-college work. Then we have a greater number of practical students on the farm than we have had in the past, and it is probable that we may require another assistant instructor, to supervise the practical work. As regards the increase in staff, those are the main points where I see a possibility of further assistance being required, beyond further assistance to myself in that the number of applicants for advice is getting greater every day, so that some help may be needed in the advisory branch.

1681. Is any research work carried on at the college ?—Yes, both on the agricultural side and the dairy side. On the agricultural side the research is mainly confined to what I might call the bacteriological side. A great deal has been done by our instructor in bacteriology, Mr. Golding, in the investigation of the assimilation of nitrogen by leguminous plants. That work he has been engaged upon for several years, and it now occupies a considerable portion of his time. With regard to dairying we have done a considerable amount of research work in the making of butter and cheese, but still more requires to be done. In fact, I consider that side one of the most fruitful branches, and I strongly hope that we in the near future may be enabled both as regards staff and funds to do more. I feel confident there is a great deal of work that requires doing, and work which would have an immediate practical application and pecuniary benefit, and that applies particularly to the cheese-making.

1682. Are your students examined at the end of the course ?—The agricultural students are only examined by their instructors. The dairy diploma students are examined by external examiners. There are three examiners appointed, one to take the practical dairy work, one to take theoretical agriculture and dairying, and one to take dairy chemistry, both theory and practice, and dairy bacteriology, both theory and practice. That examination is made as searching as it can possibly be made. And the same applies to the factory managers. The dairy diploma students and the factory managers have external examiners, but agriculture does not, and the short course students do not have an examination at all.

1683. Do they get a certificate ?—Yes, they get a certificate on the work of the course.

1684. I suppose the teachers are present when the examinations are conducted by external examiners ?—The teachers are present in the oral examinations.

1685. But do not take any part ?—No.

1686. And do the external examiners consult the teachers as to the curriculum before they put the questions ?—In nearly all cases, especially would that apply in the case of chemistry and dairy bacteriology. It has been a special rule that an examiner shall consult with the instructor before starting his examination.

1687. Is the present accommodation sufficient to meet the demands made upon it ?—No, my lord, it is not. At the present time I have students booked forward as far as next October, even in some of the short courses. All through the past session we have been particularly full, more so than ever before. In previous years we have extended from time to time in order to meet the increased demand, but as fast as we extend we seem to fill up and require further extension. During the past winter we had all the accommodation filled, and we had 13 or 14 students lodging outside the college.

1688. Is accommodation easily found outside ?—Not easily. Fourteen is as many as we can possibly find accommodation for, and then it means some of them walking two miles.

1689a

1689. Can you give the Committee some account of the way the field trials are carried out ?—As regards the actual scheme of the trials they are made exceedingly simple to begin with, the idea being to build upon them in the following years. We provide simple object lessons to begin with and they get more and more advanced as the years go on. Those field trials are situated at centres distributed over the counties, and we do not fix them at any centre unless we have very good evidence they are likely to be appreciated and there is a genuine desire to have them. When the experiment is about at its best we hold what we call a demonstration. A member of the staff goes there, having previously notified the farmers in the district that he will be there, and we get a good number of farmers to attend, and we then explain the object of the trial and they see the result for themselves. We find that gives them a certain amount of interest in these trials, and we are careful to inform them that in the winter time we shall come and give them the result of the trials, not only as carried out there, but the result of the

trials as carried out in other centres, perhaps on different soils. We find their interest having been aroused we get a good attendance at the lectures, and an attendance of men who are interested, and we give them at the same time a great deal of information concerning the general principles of manuring, and we often have applications for lectures concerning other matters. That is, broadly, the system on which we work. I, myself, attach great importance to this branch of the work. I believe it is by far the most important branch, as regards agriculture, that we are undertaking. In the early days of the college most of the out-college work was concerned with giving courses of lectures to farmers. Well, we found that that had not a very good effect. They perhaps came and listened to those lectures, but whether it made any difference to their practice is very doubtful. As the result of further experience we had very good evidence that provided we could only demonstrate what we were actually talking about, our words had a much greater effect. It was a far quicker means of gaining the farmers' confidence, and that is why we have during the past few years increased this demonstration work and reduced the number of lectures.

1689b

1690. And the lectures have been upon that field work ?—Yes.

1691. And you find that is popular with farmers ?—Undoubtedly so. There is no doubt the farmer prefers demonstration to verbal instruction.

1692. And that leads the farmer to consult with the heads of the college ?—Yes, I have had striking illustrations of that. Only a week ago I happened to be at a public meeting of farmers in the neighbourhood where we had had several field trials, and after the meeting I was consulted by a large number of farmers as to the best means of manuring their crops, especially as regards the mangels and swedes. That I attribute entirely to the confidence we have gained in consequence of carrying out the field trials in their neighbourhood.

1693. Can you state that the work done in the college is thoroughly appreciated ?—Wherever it is known I can say it is thoroughly appreciated. Where there is no appreciation it is in consequence of their not knowing.

1694. Where they are brought into contact with it they fully appreciate its value from a practical point of view ?—Yes.

(THE LORD BARNARD then took the Chair.)

1695. (By Lord Belper.) In carrying on a college like Kingston you necessarily have to produce or purchase a great quantity of milk ?—Yes, we purchase on an average about 500 gallons a day.

1696. In addition to what you produce on the farm ?—Yes.

1697. And, naturally, in carrying on a college in which that large quantity of milk has to be used, there is considerable expense attached to the dairying part ?—I consider dairying is by far the most expensive branch of agricultural education. You are dealing with a very expensive and a very delicate article, and a very small mistake on the part of the student is sufficient to involve considerable loss, and those losses do and must occur where you have large numbers of students taking dairying as we have.

1698. Where the students all have to be taught the process of manufacturing cheese or butter there must be a considerable loss—however good the quality is there must be a considerable amount of loss ?—Very considerable, and that is why I say dairying education is the most expensive.

1699. You are able to speak of that from figures. The farming part of the operations and the dairying part are kept quite independently ?—Yes.

1700. So that you can tell what the loss is on the milk after it comes into the dairy to be turned into butter and cheese ?—Yes, it almost invariably shows a considerable loss.

1701. Well, under those circumstances you think that that is a reason why a dairy farm carried on on a large scale like that should receive encouragement in the shape of grants to a considerable extent from Government ?—Yes. I have often felt that the grants that have been given to dairying education have not been sufficient in consequence of the loss that is involved in dealing with a delicate substance like milk.

1702. Now at present I think you have shown there are a larger number of students than there have ever been,

and although you increased the accommodation a few years ago, yet you will still further have to increase the accommodation owing to the interest taken in the work of the college?—Entirely owing to its success.

1703. And I suppose I may also say that your staff during the past year has been working under very considerable pressure, owing to the large number of students and the great amount of work that has to be done?—Yes, I can say that most feelingly, that every member of the staff has been working at very high pressure indeed, and something will have to be done to relieve that pressure. It has not been possible to recommend it in consequence of the financial side of the question. In looking at the number of the staff of the college, I would ask the Committee to bear in mind that the members of the staff have all worked exceedingly hard and that the work appears to get heavier year after year.

1704. The high pressure the staff has been working at must have been brought to the notice of the governing body, and I may ask you whether you would agree that the governing body would be perfectly justified in increasing the staff if they had the means to do it?—Certainly, perfectly justified.

1705. In addition to that, I think at the present moment there is going to be some further accommodation built for the staff in the shape of lodgings?—That is so; there are two houses being built for members of the staff. The governing body at all times, I believe, is anxious to retain its best officers, and in view of that they are erecting two houses, so that they may have apartments of their own instead of being resident actually in the college. I might have pointed out that although the payments to the staff have remained fairly stationary, I think it must be allowed, if the whole of the staff is looked through now as compared with what it was in the early days, you will find considerable improvement in the standing of the men has been effected. I say that, speaking of the staff as a whole; and while that improvement has been effected, the total annual cost has not been increased, mainly in consequence of the lack of funds to do it.

1706. You spoke of the research work that was being done, and I think the value of that work has been recognised for two or three years now?—For three years the Royal Society have supported the work.

1707. You were not the Principal when the college was first started?—No.

1708. You have spoken to the fact that it is found highly desirable now to decrease the number of ordinary lectures and to associate those lectures with the work done in field classes?—Yes; and in connection with that I should like to say we are doing a very considerably increased work in the counties for even less money than was contributed in the early part of the time. I will quote the following figures: In the year 1900-1 there was contributed to the college from the counties a sum of £2,337 19s. 8d. for out-college work. For that sum 18 field trials were conducted and 471 lectures given. That is, of course, apart from the general advice.

1709. That is irrespective of the work on the farm?—Yes. In 1906-7 the amount contributed under the same head was £1,088 19s. 7d., and for that field trials were conducted at 67 different centres and 168 lectures were given. Now I think those who know what field trials are will realise that 67 field trials and 168 lectures represent more value as regards work than 18 field trials and 471 lectures. That has only been done by economising in every possible way, and that economising has been done in consequence of the increased number of applications coming for the field trials from the farmers themselves, and the desire on the part of the college to in all cases favourably reply to the requests for field trials.

1709½ With your permission, I would like to quote, in support of what I said about the appreciation of the farmers in respect of this work, a letter which I received from a farmer applying for field trials. The letter came from a farmer residing in a district where we had actually had a trial in the preceding year. It reads as follows:—

“Dear Sir,

On behalf of the farmers in this district I beg to apply to you to let us have a trial ground in . . . next season. As you are aware the last one was most successful and gave unbounded satisfaction to the farmers interested. I can assure you that if you can see your way clear to have one here next season the experiments will be watched with even greater interest than the last.”

Then I might quote a resolution which was passed by the

Nottingham Agricultural Society, some of the members of which came over the college last year. I might say farmers are in the habit of coming in large bodies over the college at certain times of the year. After their visit the Nottingham Society passed the following resolution:—“The members of the Notts Agricultural Society visited Kingston College on July 10th, 1906, and desire to record their appreciation of the work carried out by the Midland Agricultural and Dairy College both at the college and at the various centres in the county, and respectfully ask the Education Committee to continue in full the financial support given to the college, and, if possible, to increase it. They believe the work to be of great value to the farmer.”

1710. Speaking generally, you would say that the increase in the work and the increased interest taken by the farmers would justify the governors in spending a very much larger sum than they do now on the college if they could lay their hands conveniently on the money required?—It would most certainly be justified. I think it is absolutely necessary that money should be spent. We have continued to progress for a number of years, and the main part of that progress has been effected by exercising the strictest economy so that the increased work might be carried out for the same annual grants. At the present moment we have gone about as far as we can in that way, and we must look for additional grants if we are to continue our progress. If we stop our progress by curbing numbers, we shall go back instead of going forward.

1711. Are you aware that the financial side of the question is looked into pretty acutely in the matter of the college, and we cannot see our way to make the money go further than it does at the present moment?—Yes, it is looked into very carefully because the governors are continually trying to do more with it. For years we have done more and more, but my opinion is, knowing, as I do, the finances pretty thoroughly, that it is impossible to go further without getting increased support.

1712. Is there any other point?—No, except that I should like to draw attention to the fact that in consequence of the counties taking increased advantage of their privileges—that is to say, filling up every scholarship they are entitled to fill—we are not able to admit so many outside students as was formerly the case, because preference has to be given in all cases to our own county students. The result of that is that we do not obtain payment of fees to such an extent as we did in years gone by. That is another reason why we shall need increased support in future years; that is, if the counties continue to send in students in the manner they have been doing during the last year or two.

1713. (By Lord Moreton.) Do any of your students enter for the dairy examination and diploma?—Yes, they do, but never to any great extent until last year. Last year we had 13 students entered for that examination out of a total, I believe, of 32 who went in for the examination. Of the whole of the candidates for the examination 19 passed, of whom 12 were ours, so that we passed 12 out of 13.

1714. So that I need hardly ask if you were satisfied with the way in which the examination was conducted?—I have not been satisfied in the past, but I was satisfied last year.

1715. (By Dr. Somerville.) Is the reason for this large increase in the number of candidates drawn from your institution due to the fact that the examination was conducted at a more convenient centre?—That was the reason for our sending in an increased number.

1716. Because they conducted the examination nearer?—It was conducted actually at the college. That is the reason we sent up more.

1717. Previously it was conducted at Reading?—Yes.

1718. With regard to these field trials which you say are so much in demand, you do not find, apparently, in your part of the country that this form of instruction is regarded as of a pioneer character rather than of a permanent character?—I regard it more as actual demonstration work rather than research work.

1719. My point is this: you know that during the technical education movement the agricultural colleges went in largely for these demonstration plots or field trials in some parts of the country. They are not now so much in demand, you don't find that in your district?—No, on the contrary. The more we do the more they are wanted.

1720. You always follow them up in any particular centre with one or more lectures?—If the local encouragement justifies it.

Mr. J. F.
Blackshaw.

7 May, 1907.

Mr. J. F.
Blackshaw.
7 May, 1907.

1721. You consider that a systematic representation of the results through a lecture is desirable as a finish up?—Very desirable. I consider the work of that trial is not finished until the lecture has been actually given, and I should mention that a report of that trial is drafted in a short form and taken to that lecture, and a copy given out to each member of the audience, and it is gone through with them, so that they are given a direct interest in the report.

1722. May I ask whether all the members of this very extensive staff are entirely engaged in the work of the college?—Not everyone that is mentioned there.

1723. For instance, the instructors in wood and iron?—Yes, the wood and iron instructors are entirely employed, but they are not entirely employed in giving instruction. The wood man is a practical carpenter who, during the rest of the time, is occupied in the college in various ways, and the same applies to the practical iron work man.

1724. Similarly with regard to the engineer, you have an instructor of engineering and an engineer?—The engineer is entirely employed in the college. The other is a lecturer on the subject, and he is not entirely employed, but simply comes to give the lectures.

1725. (*By Mr. Latham.*) Will you give us a short epitome of how you conduct the butter and cheese schools, travelling or stationary?—You mean the short courses? Take the six weeks' course of the college itself, the fixed centre. The majority of the students come from the four counties as scholarship students. The student comes in and registers, and he or she is asked what branch of dairying they specially wish to take up; is it butter-making, or pressed cheese-making, or is it some branch of soft cheese-making or Stilton. If they say they would like to take Stilton, they are advised to take a month of their six weeks in the Stilton-room, attending every morning. The same with the other cheeses, according to the difficulty to be experienced in acquiring the art of manufacture. Each morning the students have to be in the dairy by 7 o'clock, and they actually have to make the cheese or butter, as the case may be. They are kept in the dairy up to 12.30 or 1 o'clock. In the afternoon they have a lecture. Monday, for example, they would have two hours' book-keeping; Tuesday, a lecture on the theory of dairying; Wednesday, horticulture, which includes not only the lecture, but taking them out among the fruit crops and showing them the management of trees. On Thursday they have veterinary science so far as it affects dairy stock; Friday, poultry-keeping. That is for the six weeks' course. Those courses are repeated throughout the year.

1726. For that work there is no examination?—No. There is an attendance certificate which is granted only to those who have performed satisfactory work, and who satisfy the instructors that they are diligent and have done their duty to the course.

1727. You do not even go so far as to ask them to write any report on the work they have done?—No, we do not.

1728. And they have little or no record to assist them in years to come?—They are compelled to make notes of their practical work in the dairy, and those notes are supervised by the instructor and, if necessary, are corrected.

1729. Don't you think it would be a very good thing if they did make records they could carry away with them?—They are bound to make them, and they are looked upon as exceedingly useful. Our instructions are: "never trust to memory anything that can be put down in black and white."

1730. Now with regard to the travelling school?—The travelling dairy school visits ten days at one centre, and can take up to 12 students in one class. If there are more than 12 they have two classes. At the end of the course, as a rule, there is a small competition, and scholarships are awarded to those who do best, to enable them to come to the college for further instruction.

1731. Do you have any cheese schools away from the college?—Not hard cheese.

1732. Can you tell us what are the sort of students you have principally?—I have gone carefully through them, and I find from 85 per cent. to 90 per cent. of our students are the sons and daughters of farmers—young people who mean to make agriculture their profession. So far as that is concerned, I feel we have got very close to that class of student it was hoped to get when the college was established.

1733. And do they continue to follow on the work afterwards?—So far as one can judge. We endeavour to keep in touch with all our students by sending them reports,

and we hear from them frequently, and they often come back and consult us on some points on which they wish for further information.

1734. How do the prices of your produce compare with the prices of the district?—The prices as a rule are above the district, except for anything that has been spoilt.

1735. Speaking of the field trials, do you do anything in research where possibly fields may be unsuited?—Not as regards dairying. Occasionally we visit farms to find the source of some peculiar flavour in the dairy produce, and with several farms we have made some very interesting bacteriological examinations; and in every case we have been able to overcome the difficulty.

1736. Do you find any difficulty with the veterinary surgeon? Is there any feeling that he should not give certain education?—I believe there was before my time, but in my experience there has never been any difficulty.

1737. How far may his education go?—So far as county work is concerned as far as concerns first-aid treatment of stock. In college work he goes further.

1738. Have you taken up shoeing?—Yes, but not practical classes in shoeing, not beyond the students in the college.

1739. (*By Prof. Middleton.*) The longest course which you give is the 10 weeks' course for agricultural students?—But now we have a two years' course. That is not in the old prospectus, but it is in the new one. That 10 weeks' course is a part of a year's course. The course is so arranged that it occupies three ten weeks. It is progressive.

1740. I see the numbers drop off slightly; there were 22 in the first, 20 in the second, and 18 in the third?—Yes.

1741. I suppose the inferior students drop out?—Yes, and occasionally a student's father is taken ill and he has to go home.

1742. Then in the course for dairy students is six weeks the longest separate course that you have?—No, the courses as laid down in the prospectus are: Dairy Diploma Course, 36 weeks; Factory Managers' Course, 36 weeks; and the Six Weeks' course; but apart from these courses we do get other students for from three to six months.

1743. Then do any of the students come for less than six weeks?—A few come for less than six weeks, not very many. Less now than was the case formerly, because we have been so full we could not admit one or two-day students.

1744. Your normal course is six weeks for the dairy students and 30 weeks or 60 weeks for agriculture?—Yes.

1745. In addition to the 30 weeks, have you any complete course of 10 weeks?—If a student wants a short course, he takes the first 10 weeks of the 30 weeks' course.

1746. Then this number, 425, that you gave us for 1907, does not represent individual students?—Oh, no.

1747. It represents in the case of agricultural students that number divided by three?—Yes.

1748. You say not many take the two six weeks?—No, not very many as a rule, it is either the six weeks or 36 weeks.

1749. You make a point of this: that education in dairying is expensive because of the students making mistakes and injuring produce, I suppose?—Yes, there is a great deal of that. Perhaps not quite so much as one might expect, but still there is a great deal of loss involved.

1750. (*By Mr. Medd.*) Can you tell me whether each of the counties working in connection with you has an agricultural committee?—No. Leicester have an agricultural committee; Nottinghamshire is done through the Higher Education Sub-Committee; Lindsey is done through the Education Committee, I believe; and Derbyshire is done through the Educational Committee. Leicestershire is the only one that has a special sub-committee.

1751. Now do these counties consult you annually as to the agricultural education to be given in their areas every year?—So far as the out-county work is concerned, yes. I am requested at the commencement of each year to draw up a scheme, and suggest the number of field trials that shall be conducted, and the probable cost to the county.

1752. And do you have the lecture scheme drawn up each year in advance?—Not the lecture scheme. I mention the cost that will be involved by giving lectures on the actual field trials, but the balance of their grant is left to their discretion as to whether it is spent on horticulture or poultry-keeping, etc.

*Mr. J. F.
Blackshaw.*
7 May, 1907.

1753. Well, apart from the field trials and your institution, there is no permanent institution for intermediate agricultural education within those four counties?—No.

1754. Is there nothing done of a practical and definite character for either farm lads or the sons of small farmers?—No; nothing done at the present time.

1755. Now would your institution be prepared to act as the central body to work in co-operation with those four counties, assisting them to devise schemes to cover the whole agricultural education of each area?—I should think it would be perfectly willing.

1756. Well, in regard to the cost of your institution, the expenditure last year was £10,396, now what proportion of that goes to the dairying, and what proportion to agriculture?—That I am afraid I cannot answer.

1757. Perhaps you could send that on afterwards. I would like to know the specific application of fixed sums to either one or the other.

1758. (*By Lord Belper.*) Wouldn't the farm refer to both?—So far as the grants made to the dairying department for 1905-6 they were £1400, and to agriculture it was £1423 1s. 1d., so that they are practically equal. That is quite apart from the grants from the Board of Agriculture.

1759. (*By Mr. Medd.*) What I want to find out is approximately your expenditure upon dairying work, and your expenditure upon agricultural work. But of course the greater part of your expenditure is upon the staff, and you cannot easily define that?—No.

1760. I see that the Lindsey Division of Lincolnshire allocated £974 of its "whiskey money" to you, mainly for lectures in the county on general agriculture. That is so, is it?—Yes, and field trials.

1761. It says "for lectures mainly," and then I refer to the Report of your external work in Lincolnshire, and you only give 46 lectures in that county?—Yes, and a large number of field trials. The whole of the money mentioned was not devoted to lectures.

1762. I think it ought to be qualified or explained in some way because it is most misleading. The Report says this very large sum was mainly for lectures, and you only gave 46. Since the institution is in want of money, I was wondering whether you could not make a more economical use of the money you have. It seems a most expensive way of using it?—So far as the money goes, it could not be used more economically than it is at the present time. A large number of field trials are conducted on the most economical plan possible. Last year we had considerable inquiry into the question of sugar beet growing.

1763. In regard to these lectures again, what are the expenses incidental to them. Of course the lecturer is a member of your staff, and is paid as a member of your staff?—It is a question of proportioning his time, and the governing body fix the rate per lecture.

1764. Now in regard to your scholarship boys, do the scholarships cover the cost of maintenance?—The County Councils grant maintenance according as the parent is or is not in a position to pay.

1765. How do they ascertain?—By enquiring of the local County Councillor.

1766. Have you ever heard any objection to that inquiry?—No; but I have often expected it.

1767. Now, is there any entrance examination for students coming to your college?—Not at the present time.

1768. Now I see that Mr. Thornley is a member of your staff, can you tell the Committee whether there has been any appreciable result from his lectures in Nottinghamshire and Leicestershire with the elementary school teachers?—As regards the nature study work by Mr. Thornley, it has undoubtedly been most successful, in a great measure due to Mr. Thornley's abilities in that direction, more especially because he possesses the knack of interesting his students, and you will find that all his students become most enthusiastic students of nature, and in going about I frequently find these schoolmasters or schoolmistresses out in the country lanes studying nature, and the children apparently becoming as enthusiastic as their master or mistress.

1769. Then you would recommend the employment in other areas of someone similar to Mr. Thornley?—Yes, if they can get his duplicate.

1770. Your course at the college is only a short fortnight?—Yes.

1771. Could you extend it to Saturdays throughout the year?—I am afraid not without interfering with the agricultural or dairy work.

1772. You would imagine it preferable to the short course if you could get it?—Yes.

1773. At either Chesterfield or Derby they have it?—Yes, they have done much good.

1774. Do you notice an appreciable improvement in the general rural education?—We have hardly had time, but so far as I can see I have certainly been struck with the greater interest taken in their surroundings by the children, more so than was the case a few years ago.

1775. (*By Mr. Davies.*) With regard to the examinations I understood you to say so far as the dairy classes were concerned there were no examinations at the end of the course; but with regard to the two years' courses in agriculture, are there any examinations?—Yes, the examinations in agriculture are conducted by the lecturers. The long-course dairy students are examined by external examiners.

1776. I understand that your students are roughly divided into two classes, those that come from the counties affiliated to the college and those who come from outside who pay double fees?—Yes.

1777. Then I think you have also told the Committee that the number of students coming in from the counties have increased so rapidly during the last two years that you are now unable to take in as many students from outside and, therefore, your funds have gone down?—That is so.

1778. Is not that a reason why you should ask the Councils who send their students for nothing to increase their grants to the college?—Well, I should do that if I thought there was much prospect, but owing to the need for money arising out of the 1902 Act, there is more demand on the funds, and it is much more difficult to get money out of County Councils now than it used to be; and I do not wish to go to the Councils and ask for more money unless I can see a reasonable prospect of getting it.

1779. But still, as a matter of business, the contract you have to enter into of supplying them with so many student-ships, it is a fact that many more coming in has encroached upon your resources?—Quite so.

1780. And they really ought to contribute more?—I wish they could. They say they quite realise that but cannot do it. What some have done is this, they have granted scholarships in excess of the privilege and have paid the difference, but the difference only at county rates, that is half what we charge outside students.

1781. Your college is residential, is it not?—Yes.

1782. What fees do you charge to outside students?—For instruction in dairying £1, and boarding fees 15s. male and 12s. female. The composition fee for the longer course (36 weeks) is £27.

1783. Are these field trials paid for out of the county grant?—Each county makes a grant at the beginning of the year of so much, Nottinghamshire £300, Leicestershire less; then that money is spent either in field trials or lectures, each trial being reckoned at a fixed rate of which they are forewarned by my scheme issued at the beginning of the year.

1784. Then with regard to the remuneration of the staff, I understood you to say that the staff has been underpaid during the last few years, that their work had increased very much and they had had no extra remuneration?—That is so.

1785. Suppose the Government proposed to give a further grant would you recommend that the stipends of the teachers should be increased or new departments created?—Well, in some cases the stipends will have to be increased, undoubtedly. That must be done. With regard to new departments, there are new departments we would like to add when the funds admit.

1786. Those are the most important things?—Yes—increased staff—and increase in certain of the courses.

1787. You said that in response to some applications from co-operative dairies that you established a special class for factory managers, have any co-operative dairies made grants towards the college or given scholarships?—No.

1788. None whatever?—No.

1789. Have you applied to them?—No.

1790. How many applications have you had for factory

Mr. J. F.
Blackshaw.
7 May, 1907.

managers?—Well, I cannot say. I have always far more applications than I have suitable men to recommend. Up to the present all our men have been taken up immediately they have finished their course.

1791. Are those factories in your immediate neighbourhood?—Throughout England, and some abroad. Two men have recently gone to South Africa: but, generally speaking, they are in England or Wales.

1792. And the reason they apply to you is because they recognise that you are making a speciality of that?—I suppose so.

1793. (*By Lord Barnard.*) I should like to ask one or two questions. The governing body of this college consists of representatives of County Councils, are there any outside representatives on that body?—Only the Yorkshire representatives. Mr. Cope mentioned that we have had for some years a working arrangement with Yorkshire. If we have a student who wishes to take a degree in agriculture—we do not have many—we send him to Yorkshire. In the same way if Yorkshire have a student who wishes to specialise in dairying, they send him to us, and owing to that we have a representative on their Council and they have a representative on ours.

1794. How often does the governing body meet?—Quarterly.

1795. At the college?—At the college.

1796. Who is the clerk or secretary?—I am.

1797. Do they practically control the college or is it left largely in your hands?—They have the control; I carry out their instructions.

1798. Do you report to them verbally or in writing?—I report in writing every quarter.

1799. Do you know whether the reports as to the college come before each administrative County Council?—The annual report does. I do not know about the quarterly reports.

1800. Do you keep the actual accounts yourself?—Yes; they are under my supervision.

1801. (*By Lord Belper.*) They are audited?—There is a financial committee that meets every month and the accounts are audited at the end of every year.

1802. (*By Lord Barnard.*) Are you satisfied with the system of control?—Yes, my lord.

1803. Government exercises a certain amount of control too, I suppose? They send an inspector down?—The Board of Agriculture, yes. An inspector comes about twice a year.

1804. Does he ever make any suggestions?—Yes, from time to time.

1805. Should you have any objection to the extension of Government control?—That is rather difficult to answer. If it is in the direction of what has gone on in the past, I should have no objection.

1806. You must recognise, I presume, that increased aid from the Government involves increased Government control?—So long as it is as agreeable as it has been in the past I should have no objection.

1807. You are satisfied with the control of the Board of Agriculture, and do not hanker for the Board of Education?—I do not wish for anything different.

1808. You referred to the sums which were necessary for supporting the institution, and you included in those sums stocking the farm; do you have separate farm accounts?—Yes.

1809. And I suppose you use them for the students?—Yes. But so far as profit and loss on the farm is concerned, we cannot.

1810. You keep an ordinary live stock account, and do you value the live stock at the end of every year?—Yes.

1811. You also referred to buildings; were you using the term in the ordinary sense, or in the technical sense?—The whole of the buildings on the ground.

1812. As to the outside students, do the fees which you charge them cover the cost of their education?—That somewhat depends on the course taken. On some courses, yes; on other courses, no. I doubt very much whether the charge covers the special course in bacteriology. If a student comes and wishes to receive special instruction in a class of cheese we are making daily, then the fees will cover the cost; but if it is some cheese for which we have not a market, then the probability is it does not cover it.

1813. I see one student came from Turkey?—Yes, he was a son of a late Turkish Minister.

1814. He came to acquire a knowledge of practical farming?—Yes, he was at work on the farm with the other students.

1815. How long have you been at the college?—Since 1899.

1816. Might I ask where you were before?—For two years I was assistant to Professor Wright, at the West of Scotland Agricultural College. Previous to that I was at Bangor.

1817. Perhaps you can tell the Committee whether you have always been associated with farmers?—My people are farmers and I was brought up to the practice of agriculture.

1818. You told the Committee you considered your staff inadequate, do you think that is a peculiarity of your institution, or do you think that applies generally to all institutions?—Well, I naturally think it is a greater peculiarity of our own, but no doubt is true in many other cases.

1819. Would you agree at present that the amount of higher instruction is growing?—Most certainly. I think during the past two years there has been a greater development than during the whole of the years before.

1820. That would account for the movement amongst teachers. My experience is teachers are constantly leaving because they go and apply for better posts. Do you agree with me there?—Undoubtedly.

1821. Mr. Latham asked you as to your veterinary instructor, is he wholly employed in the institution?—No.

1822. Is he a veterinary surgeon in practice?—Yes, he has a practice. In the winter he is almost wholly employed in the college, and he has a very capable assistant at his place in Nottingham.

1823. How many of the staff reside on the premises?—Seven, I believe it is.

1824. Mr. Latham asked you about the dairy students, when they left whether you gave them a certificate?—Yes, of attendance.

1825. Is that certificate ever withheld?—Yes, most decidedly, that is one of the things we are very strict about.

1826. It is of some value?—I regard it as of value. I would not give it to anyone who had not done justice to the course.

1827. It is not given as a matter of course?—No.

1828. Is it laid down by your governing body or by any other authority, or by yourself, that you should lay yourselves out to educate the sons of farmers principally?—That is looked upon by myself and I believe by the governing body as the primary object of the college.

1829. And that is fulfilled by the fact that some 80 per cent. to 90 per cent. are the sons and daughters of farmers?—Yes.

1830. But you don't suggest that other persons who wish to take up either the actual practice of agriculture or else pursuits closely identified would be prevented?—No, I don't suggest that for a moment, provided those impractical students were willing to go to practical work on the farm for two years before taking theory. But if they wanted to come and take the theory before taking the practice then I should have no compunction about giving preference to a farmer's son.

1831. In your opinion are you satisfied that farmers in the district with which you are acquainted are daily becoming more and more alive to the value of the instruction which is provided in the college?—Absolutely certain of it, you can feel that in going amongst the farmers as I do, the change is almost from week to week. You feel the appreciation is greater.

1832. (*By Mr. Davies.*) With regard to the scholarships, you told Mr. Medd that the scholarships were awarded by particular County Councils; there was no examination, but each particular district County Councillor who was allocated for that district made enquiries into the applications and awarded the scholarships?—He recommends them.

1833. Would you recommend on principle that all the money should be pooled, and the scholarships should be allocated by the people in the college rather than by the County Councils?—I do not know that I should advise that. In one sense the money might be more usefully spent; in other ways I am afraid it would lead to friction. I think on the whole it is better as it is now.

FIFTH DAY.

Wednesday, 8th May, 1907.

PRESENT :

The Right Hon. Lord REAY, G.C.S.I., G.C.I.E. (*Chairman.*)

The Lord BARNARD.

The Lord BELPER.

Lord MORETON.

Mr. F. D. ACLAND, M.P.

Mr. DAVID DAVIES, M.P.

Mr. NORMAN LAMONT, M.P.

Mr. THOS. LATHAM.

Mr. J. C. MEDD.

Professor T. H. MIDDLETON, M.A., M.Sc.

Professor W. SOMERVILLE, D.Sc.

Mr. H. S. STAVELEY-HILL, M.P.

Mr. A. E. BROOKE-HUNT (*Secretary*).

Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. M. J. R. DUNSTAN, M.A., Principal of the South Eastern Agricultural College, Wye, recalled and further examined.

1834. (*By the Chairman.*) Is there in your opinion any line on which the development of the work of the Wye College might proceed?—I think, my lord, that in the direction of horticultural and fruit-growing work there is room for a good deal to be done by the college. Of course, we are situated in the middle of a fruit-growing and horticultural county, and undoubtedly some development is wanted on those lines, and also, as I mentioned in my evidence last week, on the lines of the purely research part of the work of the college. I think in those two directions there is opportunity for considerable development. We have started a certain amount of horticultural work, but it has only just been commenced really, and our resources at present are quite insufficient to enable us to cope with the amount of work required.

1835. You think that means are required for development in the direction you have mentioned?—Certainly.

1836. Have you any further opinion to offer as to the basis upon which grants should be allocated by the Board of Agriculture?—I have been considering the question as to the basis of grants being allocated according to the expenditure on salaries, and as to whether that could in any way be dealt with, and I think it certainly could be. The objection I had to the proposal in the first instance was that an increased grant according to increased salaries might possibly be used merely for augmenting salaries without consideration of the requirements of the individuals for increased remuneration. But I certainly think if that were safeguarded it might be a satisfactory basis on which to work. With regard to the other basis, as to the amount of contributions given by the counties—of course the attitude on the part of the Board of Agriculture always has been to help those who help themselves, although I do not think that has altogether worked out quite on the lines that were expected—I do not think the number of students should be made a basis, and I do not think the total expenditure of the college should be made a basis, but I certainly think the expenditure on salaries is an evidence of the efficiency and the extent of the work done, and that that might reasonably be a basis.

1837. The expenditure on an efficient staff?—The expenditure on an efficient staff.

1838. What are the most pressing needs of your college at the present time?—Increased accommodation for students. We are situated in a village where the accommodation for students is exceedingly poor, and the accommodation of the college is only for 54 resident students.

1839. That would be capital expenditure?—That would be capital expenditure, but it would be remunerative to a certain extent. At the present time we have more applications than we can deal with, and, of course, the accommodation in a small country village is exceedingly limited.

1840. Have you any short courses for the instruction of the small farmers in your neighbourhood?—We have none at present, but we should like to have some. With our present accommodation it is absolutely impossible unless we reject some of the students who come for the

long courses. We have no room for extra students, but I certainly think we might do something for the small farmers in the way of short courses, and I certainly think we might do something also in the way of technical instruction for the labourers. That instruction would be given by means of a labour master on the farm. My idea would be to have apprentices—young fellows from the villages, or anywhere, who would be apprentices and who would be taught their trade properly. I think that might be done.

1841. Do you think the farmers would be prepared to allow their sons to attend those courses?—I think we should really get the young fellows before they went on to a farm—young fellows of fifteen or sixteen—and take them and teach them some definite part of their work. The supply of labour is very very short now in Kent, and the need is very pressing.

1842. (*By Lord Moreton.*) Are all your students in-students, or are there any out-students?—There are 54 in-students, and the remainder are out-students. Some of them live in college rooms, and some on the farms, and about 50 of them live in the village.

1843. Which do you find most popular amongst students, to live in or out?—Their independence of course; but they are not allowed to live out until they have proved themselves to be reliable, and no student is allowed to live out until he has been one year at the college.

1844. I take it that your students are mostly young. What would the average age be?—The average age would be about eighteen.

1845. (*By Mr. Staveley-Hill.*) I see your courses of instruction contain a Bachelor of Science degree, and a diploma course and a certificate?—Yes.

1846. What proportion of your students go in for the first of those, the Bachelor of Science?—Five per cent.

1847. That is a four years' course?—That is a four years' course.

1848. What proportion of them simply come for the two years' course, the certificate course?—About 30 per cent. I should think for the two years' course.

1849. If you were to adopt the suggestion you made in answer to the Chairman to have instruction for labourers, could that be carried out at your college, or would you have to have travelling lecturers?—I should have the labourers on one of the college farms; it would be more the training of the labourers in the manual work—shepherding and stock managing, and so on.

1850. Do you think you could get the boys there before they really took employment on farms?—I am quite sure I could get apprentices there.

1851. (*By Dr. Somerville.*) I should just like to ask you, Prof. Dunstan, whether you support the view that has been placed before this Committee that young farmers are sufficiently attended to as far as their technical education is concerned, by the indirect influence that is brought to bear upon them through the improved agriculture

Mr. M. J.
R. Dunstan.

8 May, 1907.

Mr. M. J.
R. Dunstan.
—
8 May, 1907.

that they see in their own neighbourhoods, upon the farms there, by men who may have gone through a complete training such as your institution provides ?—I should say that would be quite insufficient.

1852. I suppose you would be of opinion that a small proportion of the bulk of the young farmers are now sufficiently provided for ?—A small proportion.

1853. How do you propose that the bulk of young farmers should be educated ?—Do you mean the bulk of the young large farmers, or the bulk of the young small farmers ?

1854. I do not really care whether they are small or large, but what are usually called the rank and file of the young farmers in the country ?—I think you can get at them in two ways : firstly, by short courses or longer courses at the colleges ; and secondly, by having district schools of instruction for those farmers.

1855. Is there such a district school, in point of fact, in either of the two counties which are associated with your college ?—None whatever.

1856. Are any such schools actually in existence in England with which you are familiar ?—We carried on two in Nottinghamshire some six or seven years ago. I think we had twenty week-day lessons or lectures for these young farmers.

1857. Are you acquainted with the school at West Lavington, known as the Dauntsey Agricultural School ?—No, I am not.

1858. They are boys up to about the age of 16 or 17, who are first of all given a good secondary education, and in the latter year or years of their school life they are given a technical education to the extent of being made familiar with the botany of the grass fields, with the principles and practice of surveying, and, I suppose, with the elements of agricultural chemistry. Do you think that such an institution as that might be duplicated with advantage throughout the country ?—I certainly think it might be. An attempt was made some years ago to utilise the existing grammar schools by means of giving instruction at those schools to reach the farmers' sons, but on taking a census of the two chief schools in Nottinghamshire, Mansfield and Newark, we found the proportion of the farmers' sons was so small that it was not worth while carrying on the instruction. But this Dauntsey School is essentially a school for farmers' sons and is a very different thing altogether, and I certainly think very good work might be done there.

1859. (*By Mr. Latham.*) You said just now that you thought you would like to have the labourers, that is the young boys of 16, as apprentices. Do you think their parents would agree to anything of that sort ?—It would depend upon what terms we could take them on. I expect the parents would want some small payment made to them.

1860. Allowed back to them for services that would be rendered by their sons ?—Yes.

1861. Would that not be very difficult indeed to work ?—There are difficulties with regard to it, but I think they could be overcome.

1862. What would you attempt to teach them when you had got them ?—I should attempt to teach them to be useful farm hands, and to work with more intelligence than some of our farm hands work at present.

1863. That means practical work ?—Yes, practical work, and a little agricultural science of sorts, and turn them out more efficient labourers than they are at present—sheep-shearing, milking, attending cattle and horses, and possibly a little hedging and work of that description might be added.

1864. How long would you think it would be desirable to keep them with you ?—I should be inclined to keep them for a time—to retain them as actual workers on the farm for a certain time, and then let them go.

1865. You do not think that you would so raise their position that they would be inclined to give up agricultural labour altogether afterwards ?—Certainly not.

1866. We heard yesterday that agriculture should not be attempted in secondary and country grammar schools. Is that your opinion ?—It all depends on the interpretation of agriculture. I think agricultural chemistry should not be attempted in country grammar schools.

1867. That agricultural sides should be added to the schools ?—No, I cannot say that I agree with that altogether. If agriculture is properly taught in agricultural schools, such as Dr. Somerville has mentioned, I think you might do a very large amount of useful work.

1868. It would be very much better for you if the

students had been prepared at such a school ?—We should get them very much better prepared to come on to us. I think it is a great mistake to teach agriculture in elementary schools.

1869. Are you speaking strictly of elementary schools ?—Strictly.

1870. Where those very boys of 16 that you want would come from ?—There is no time in the ordinary elementary school to introduce such a thing as agriculture, and if it is taught it must be taught in a very perfunctory way.

1871. We are doing as much as we can to teach these boys the growing of vegetables and so on in the school gardens attached to many of these elementary schools ?—Yes, but that is horticulture.

1872. Yes, but it leads on to agriculture ?—Quite so ; that I should agree with.

1873. It makes them fond of the land ?—Quite so ; I quite agree with that.

1874. I forget exactly your definition of the farmers' sons that you gave just now. Would you mind saying again what you consider the small farmer's son is ? There is a great difference between the large farmer's son and the small farmer's son ?—A great difference. As a rule the small farmer's son cannot be spared from home for the same length of time that the large farmer's son can be.

1875. What courses would you suggest for the small farmer's son ?—Short courses ; between haytime and harvest would be one course, so as to get them in the slack periods of the year.

1876. How long would you keep them at the college ?—For six or eight weeks at a time, and then let them go back, and take them again next year.

1877. Would it be possible for these young farmers to get scholarships ?—Yes. The system in Nottinghamshire is now that they have short courses and scholarships which are given by Nottinghamshire, Derbyshire, and several of the adjoining counties.

1878. You have none at present, I understand ?—No, we have no room for them at present, but we hope to have.

1879. (*By Prof. Middleton.*) You have had experience of these short courses in Nottinghamshire ?—Yes.

1880. From your experience do you think they are particularly adapted for the ordinary farmer's son ?—Particularly adapted.

1881. I understand the reason that you have not introduced them in connection with the college at Wye is because you have no accommodation ?—No accommodation.

1882. It is quite impossible to take them in ?—Quite impossible without accommodation. We have all the materials for teaching them, and the staff for teaching them, but we have no room.

1883. You have courses for elementary teachers ?—Yes.

1884. During the summer, at a time when farmers' sons could not attend ?—No, they could not come then.

1885. You spoke about teaching labourers on the college farms. You would not be able to take many on farms such as you have at present ?—No, we could only take from half a dozen to eight.

1886. You are thinking, then, of a very small experiment to be carried out by yourself ?—Quite so.

1887. Do you think it would be possible to have similar instruction at other centres in the county ?—I think where there is a college farm, certainly.

1888. That is to say you could send out instructors from your college farm to other districts ?—Yes.

1889. Do you find that the research work being done in your college assists the educational work ?—Immensely. A general atmosphere of investigation is of great advantage in a college, and senior students always take great interest in the research work that is being carried on. We find it is of immense advantage.

1890. (*By Mr. Medley.*) In regard to the agricultural sides to secondary schools, are you aware that all agricultural sides under such circumstances have failed hitherto, and that the majority of them have been abandoned ?—I understand the West Lavington school has been successful, but I have not investigated it.

1891. That is a different type of school altogether ; that is a school which you may say is essentially agricultural, the

secondary part being incidental, as it were. That school exists mainly for agricultural purposes. I am speaking rather of the agricultural side attached to ordinary secondary schools?—No, that has not been successful generally. At Brewood it is fairly successful, I believe.

1892. Have you many students outside the counties of Kent and Surrey?—About half our students come from outside Kent and Surrey, and we have ten students from London now.

1893. Does the London County Council make you any grant?—No, none whatever. Of course, a good many of those students reside within the London County Council area in Kent.

1894. Have you any scholarships for students outside Kent and Surrey?—None whatever, except that the Devonshire County Council have once allowed one of their scholarships to be held at Wye.

1895. Do you think it would be desirable to have one or two scholarships open to students from other parts of England?—Yes, I think from those counties that are not affiliated to any institution at present.

1896. To enable the sons of people who cannot afford your very high fees and who have no local institution available?—Quite so.

1897. Can you offer any suggestions as to the more specific allocation of the Board of Agriculture grants?—In our own case I take it that the greater part of the Board of Agriculture grant goes to keeping up the county work. A sum of £200 is allotted each year to the farm, and the balance goes to supplement the local contributions towards the lecturing and experimental and analytical work performed for the counties. I have taken out the figures very carefully on those points, and I find if we divide the Board of Agriculture grant into two parts and put £200 to the farm, the balance supplements the local contributions sufficiently to pay for all this external work.

1898. Would you suggest that in future it is very desirable that the Board of Agriculture should be able to meet by grants the money locally raised: that is to say, for every pound raised locally the Board of Agriculture should be empowered to make a grant of £1?—I should be very glad indeed to see it.

1899. That is a very desirable thing?—Most desirable.

1900. Do you think it desirable that the Board of Agriculture should carefully differentiate between different types and grades of schools in its report and in its allocation of grants, grading them as first grades or advanced, and second grade, or intermediate?—I think some such grading would be desirable, but it would be a little difficult to carry out.

1901. It would create jealousy doubtless?—Yes.

1902. But in the interest of agricultural education it would be desirable that parents and the country at large should know definitely the type and grade of each particular institution?—Certainly.

1903. Do many of your students go in for the National Diploma?—About five or six per cent.

1904. Can you suggest any form in which the examination for that diploma could be improved or commend itself more generally to the bigger institutions?—I am afraid that I do not regard the National Diploma examination as an agricultural educational examination at all. I am entirely out of sympathy with the syllabus and with the method of conducting the examination.

1905. Can you suggest any definite improvement?—I should suggest that the examination should be carried on by people who have had agricultural students under their educational charge, or that they should have had some experience in agricultural education. At present the examination is conducted by a number of experts in their various subjects, but very few of those experts have ever known practically what agricultural students are taught or how much they can assimilate. The chemistry syllabus is evidence of that, it is taken in two parts; and again the botany, which requires rather more observation, is taken entirely in the first year. The agricultural engineering paper is mainly physics, and that can be passed by a student with a good knowledge of physics, and no knowledge whatever of agricultural implements. I would suggest that all the educational bodies of the kingdom should form a body which should really decide upon the future of what is called the National Diploma examination,

and put it upon lines that I think would be rather more in accord with the existing educational institutions, and rather more in accord with the views of existing educationalists.

1906. Working in accord with the Board of Agriculture?—With the Royal Agricultural Society or with the Board of Agriculture.

1907. With regard to the experimental work, do you consider that a central committee—not, of course, to interfere with the local work, but to collate information and to enable meetings to be held for the purposes of consultation and so forth, and to be the channel for dealing with the grants from the central authority, would be an advantage?—I think a central authority for the awarding of grants, and for the differentiation between what are truly experiments and what are only demonstrations, would be of great advantage.

1908. And also for bringing individual experimenters into touch with those doing similar experiments in different parts of the country?—Yes, I think the co-ordination of experimental work wants looking to in this country.

1909. You have short courses in the summer for elementary school teachers?—Yes.

1910. You propose to introduce a scheme for a third year's course of instruction for selected teachers?—It is suggested.

1911. You propose to submit a scheme to the Board for approval?—Yes.

1912. Of course it would be of great advantage if selected teachers from the rural districts could obtain a year's training at such an institution as Wye?—Yes, provided the student had already gone through two years at a training college and had shown evidence of being adapted to rural teaching.

1913. That course, I take it, would only apply to certificated trained teachers?—That is all.

1914. The regulations of the Board permit it already?—They do, but it has not been taken sufficient advantage of.

1915. You are familiar with the Swanley Horticultural College for women?—Yes.

1916. Can you kindly give the Committee your impression of its work?—My impression of Swanley is that the work has very much improved in the past five years. It affords excellent practical instruction to students in horticultural work and at the same time the scientific work is given, not perhaps as satisfactorily as it might be done, but still as far as their resources go I think it is given fairly satisfactorily, and Swanley is doing most excellent work in horticultural instruction. Where Swanley wants strengthening up, if it is thought desirable, would be on the scientific side of the college.

1917. The institution suffers from want of funds, I believe?—Yes.

1918. (By Mr. Latham.) I see you say your students are about 15 per cent. drawn from the agricultural classes?—15 per cent. from the farming classes.

1919. You go on to say further on that you do not consider a large percentage of the sons of farmers are now following the profession of their fathers?—A great many in our district do not do so now.

1920. You say the farmers of the future seem to be in course of being recruited from the mercantile and professional classes?—That is so certainly, in our experience.

1921. How much experience have you had in the South of England?—For the last five years. I may say that I noticed it much more in the South of England than in the Midlands.

1922. Do you consider that the sons of these professional and mercantile men are likely to make as good farmers as the sons of the old farming class?—I do not see why they should not. Several of the old students of the college who are now farming were drawn from those classes, and they are doing well.

1923. They are more easily led by science than the old-fashioned farmer, I presume?—I think they go rather more into details, but I think the old-fashioned farmer can still beat a good many people now. In our district, however, I know that when I have asked the farmers whether they are going to send their sons into farming, they have said "No," they are going into engineering, or they are going to be doctors, or into some of the other professions. I have asked them "Not into farming?" And they have said "No thanks, I have had enough of that."

Mr. M. J.
R. Dunstan.

8 May, 1907.

Mr. M. J.
R. Dunstan.
8 May, 1907.

1924. You take it from that, I presume, that following upon the bad times that have come upon their own business these people have had enough of it, and they do not want their sons to have the same experience?—Yes, they say they do not care for them to go into farming.

1925. (By Lord Belper.) I asked you before what your view was with regard to the allocation of the grants given by the Board of Agriculture. I do not know whether there is anything you would like to add or supplement to the answer you gave me the other day?—With regard to the question of the awarding of the grants in relation to the amount of salaries paid by the institution?

1926. Yes?—If the salary list was properly inspected and care was taken to see that the prospect of an additional grant from the Board was not used merely to augment salaries irrespective of the efficiency of the individual, I think that the salary expenditure might well be taken as an index of the efficiency and of the extent of the work of the college.

1927. I think you rather made a distinction between the positions of different colleges with regard to the salaries of their respective staffs?—Yes.

1928. That I suppose you consider is a matter that ought to be taken into account in arriving at any grant based upon the amount of salaries paid?—Quite so. Take for example a college that is losing or likely to lose its Head, or one of its very efficient servants. The reason perhaps is that he is getting another position with £100 or £150 more. The college would say possibly to the Board of Agriculture, "We think he is a thoroughly good man, and his work is very greatly to the advantage of the college, and we are prepared to give him another £75 a year if we can look forward to your grant recouping us to the extent of another £75." In that way you distribute the Board of Agriculture's grant with the local grant.

1929. That presupposes that you are going on with the present grants and that the Board of Agriculture is only paying a certain addition in relation to the addition that the governing body themselves are giving?—Quite so.

1930. But supposing the whole question of the allocation of the grants were reconsidered *ab initio*, are you prepared to say that you could allot those entirely upon the amount of salaries paid without other considerations?—No, you could not. The salaries paid in different institutions varies so greatly that there would have to be a thorough inquisition into the salary list, I suppose, of every college.

1931. I suppose you would consider it would be desirable that some consideration at all events should be given to the amount of grant contributed by the County Councils at present?—Quite so, certainly.

1932. And also to the total expenditure of the particular institution to which the grant is given?—The total expenditure on educational work. Of course, the total expenditure of a college like Wye compared with the Armstrong College, for example, is very different. Our expenditure is very much greater than theirs, but ours includes, of course, the board and lodging of the students, which must be cut out from the total expenditure.

1933. (By Lord Barnard.) I think when you were here the other day you said you would, when you came again, try and get us some further information as to whether there was any endowment to your college?—I have brought a copy of the scheme with me. There is no endowment at all. The schedule shows that we possess the buildings known as Wye College, with site, field, stables, and out-buildings. That is the endowment of the institution. That we paid £1,000 for, and we contribute £12 10s. a year out of our income to the local school authorities, so the endowment is a negative one in our case. We have paid for this. There are just one and three-quarter acres of land.

1934. We will not go into details, thank you. I only wanted to know whether the institution had been subsidised by endowment?—No.

1935. Perhaps you had better let me have a look at that scheme?—Certainly. (Handing book.)

1936. I believe the counties of Kent and Surrey have a very considerable area of woodland, have they not?—Yes.

1937. So that amongst other classes of labourers, supposing you provide instruction for labourers, you would have to consider woodmen as well as farm labourers, would you not?—Yes.

1938. You would regard that probably as a very important factor. In addition to the instruction in farming

you would consider instruction in forestry a very important factor?—Quite so; but forestry in the south of England is not of a very advanced character at present. It requires to be developed.

1939. Do you not think it is advisable that it should be?—Undoubtedly.

1940. Do you think that some advance should be made in the instruction of forestry?—Undoubtedly.

1941. (By Mr. Middleton.) In reply to Mr. Medd you said that in your opinion a central committee would be valuable for the purpose of co-ordinating work?—Yes.

1942. You might just explain what type of work you think requires co-ordination?—A good deal of the demonstration work which is not co-ordinated at present—a good deal of the work which has been set out in the Agricultural Education Association's Memorandum for a long time past which has never properly been taken advantage of.

1943. Then your reply referred to these demonstration and local experimental plots?—Yes.

1944. Were you thinking at all of what you formerly referred to—research work?—No, I think research work must be left to the individual; I do not think any central committee should lay down lines for research. What they certainly might do is to decide whether a particular kind of research work or a particular individual should have a grant or not, but I think the lines of research work should be left absolutely unfettered. A central committee might suggest, but they should not control.

1945. Do you think that any considerable extent of overlapping goes on in connection with research work. It has been suggested that there may be some wasted labour?—I do not think there is sufficient research work done to let in any question of overlapping.

1946. Do you know of anyone engaged in research work in the country who is not aware of what has already been done on the subject?—I should think they would be very badly equipped for their work if that was the case, because the first business of a researcher is to ascertain what has been done in the field before he commences to work himself.

1947. I understand now that your reply refers altogether to demonstration work?—Yes.

1948. You think that demonstration work does require some co-ordination?—Yes.

1949. You referred to the fact that the Agricultural Education Association has been attempting to deal with that question for years?—Yes.

1950. In your opinion that Association has not been successful in co-ordinating the work?—I do not think so altogether.

1951. You think, therefore, that some outside pressure is necessary?—Yes, some outside suggestion I would say rather than pressure.

1952. You would not trust to voluntary effort?—I should like to see voluntary effort co-ordinated in a small way, and possibly controlled in a small way.

1953. (By the Chairman.) You are of opinion that agricultural education in England should be centrally organised, but you are in favour of institutions being left to a great extent independent in providing for the wants of local education?—Yes, I believe there should be a certain amount of elasticity in the co-ordination of the whole.

1954. You think that a national examination for all the colleges, bringing all the colleges into line, would be desirable in preference to an examination carried out in the locality in accordance with the teaching which is there given?—I should like to see a good strong examining body appointed to deal with that, conducted on educational and scientific lines to which all the colleges could subscribe.

1955. Which should be under the control of the various colleges?—Yes, they could form an examining council and nominate examiners. I do not see why a strong educational council should not be formed to which the universities and agricultural colleges could nominate delegates, and they could frame a scheme of examination which would be elastic enough to suit all their needs.

1956. With a considerable amount of option?—With a considerable amount of option.

1957. So that the agricultural colleges could send their students there to be examined on the lines on which they had been taught?—Quite so.

1958. It would be a national guarantee of the students' efficiency?—Quite so.

1959. (*By Lord Moreton.*) How would you propose that such an examination should be paid for? It would cost a certain amount of money, and have you any idea how the financial side of that question should be met?—The payment would be, of course, for the examiners and examination expenses, and rooms and so on. I take it the universities would probably meet the council in that matter. I do not think with regard to the hire of rooms and so on, for examination purposes if the examination were held at one time at the London University, another time at Leeds, and a third time somewhere else, and so on, that there would be very much expense on that score. Then with regard to the question of examiners' fees, I think that would be met partly by the candidates' fees for examination, and I think the universities and the colleges would be prepared to give a small grant towards the central council which would defray the expenses.

1960. Would you be in favour of such a body taking the dairy examination work too?—They might do, of course, but there are so few dairy colleges in England that I think that might be left under the control of the dairy colleges themselves.

1961. Are you in favour of such a body being presided over by the Board of Agriculture, or would you have it entirely unofficial?—I should have it presided over by the Board of Agriculture or the Royal Agricultural Society.

1962. (*By the Chairman.*) What relation would the degree at that examination have to the degree of the London University?—They would be two entirely distinct things. The degree of the London University implies first of all a matriculation examination; secondly, an intermediate examination; and thirdly, a final.

1963. There would be no need for further instruction for students who took that examination?—No.

1964. You are contemplating an examination for another class of student?—Yes, for another class of student who is not good enough for the graduate examination; the the graduate examination means a very long course.

1965. (*By Professor Middleton.*) You think there is a

necessity for a second grade national examination?—A national examination.

1966. Of a second grade inferior in type to the university examination?—I think so. I think it would be desirable, more perhaps from the point of view of foreigners or our own colonies who require an examination or some evidence of that kind as a guarantee of a student's qualifications.

1967. But surely they take the evidence of a university degree?—Undoubtedly they take the university degree as evidence, but I mean in the absence of a university degree. Each college in the past has been in the habit of setting its own standard of diploma, and these standards vary enormously as you know, and what we want is some, as it were, national standard.

1968. (*Mr. Acland.*) You want to set up a second grade examination for the advantage of foreigners and others?—Yes, I think that is necessary. It is a test of training as well.

1969. Can you have anything like a uniform examination as a test of training, or do you think inspection is a better word than test?—If you insist on your students having gone through a number of years or terms course of training, then you supplement your examination with a test of knowledge and training as well. Take the London University examination. The student is not examined necessarily in subjects but has to provide evidence of having attended a systematic course of instruction on certain subjects.

1970. Do you think that that class of examination would be of educational benefit as well as a convenience?—No; I do not think it would be of very great educational benefit. It is simply for convenience and for the external evidence of a student's qualifications. That is what is wanted.

1971. Which could not be gained by inspection at the institution or by the report?—It could be gained in that way, but I very much doubt whether external bodies or external authorities would take the same notice of an inspection as they would of a definite examination. We have not got rid of the bogey of examination yet.

*Mr. M. J.
R. Dunstan.*

8 May, 1907.

Mr. WILLIAM MANNINGTON, Chairman of the Agricultural Sub-committee of the East Sussex County Council, called and examined.

1972. (*By the Chairman.*) You are a member of the East Sussex County Council?—I am.

1973. And Chairman of the Education Committee?—Of the Agricultural Sub-Committee of the Education Committee.

1974. You are Chairman of the Governing Body of the Agricultural and Horticultural College at Uckfield?—Yes.

1975. Will you give us some evidence of the work that is done by that college?—I would prefer to answer any question. I mean I do not quite know what you want; and as to details of the work, I think you will find that Mr. Woodhead, the Principal, would be better able to give you any information.

1976. The college was founded in the year 1894 by the East Sussex County Council?—Yes.

1977. For the purpose of supplying at moderate fees practical and scientific instruction in agriculture and horticulture?—Yes.

1978. To those who intend engaging in agricultural and horticultural pursuits?—Yes.

1979. Also to assist others who are actually engaged in farming?—Yes, in any way possible.

1980. Are the farmers favourable to your college?—They are now. At first we had a very unfortunate history, but we have got through that. We had a lot of trouble and that alienated the farmers a good bit; but under present conditions the farmers are rallying round very well indeed, and they frequently ask for information, and also send samples for analysis and that kind of thing.

1981. You are conducting experiments in various parts of the county?—We are.

1982. Are any experiments attended by the farmers?—Yes, there is a good deal of interest taken in them, and we also have experiments on our farm which we are carrying on in connection with the college.

1983. Is the farm the property of the college, or is it rented?—It is rented.

1984. What is the size of the farm?—102 acres, I believe, and the rent is £100.

1985. Do you do any work in connection with dairying?—Yes, we carry on a dairy at the farm, and the students do the practical work of milking, and also butter-making.

1986. Are the students mostly sons of farmers who attend the college?—They are mostly sons of farmers, but we naturally want the college filled up, and where we have applications from others we entertain them. We always let farmers' sons stand first, but where we have room, we do take other students. We now take them at a price at which they pay us. The out students cost the county nothing at all: they pay £75 a year now.

1987. Are the students of the county admitted by scholarships, or how are they admitted?—There are five scholarships—we limit ourselves in those to the sons of farmers. We have just initiated a new scheme by which sons of farmers who cannot afford to pay the full fees, provided they are sons of *bona fide* farmers in the county, are admitted at £10 a year. Of course we lose money out of them, but it is a class that we feel wants assisting more than any other.

1988. Are they resident at the college?—They are resident at the college.

1989. What number have you of those?—Six.

1990. I understand certain members of the County Council are not very favourably disposed towards your institution?—That is so; but I think it is in no way connected with the carrying on of the college.

1991. With regard to your finances; can you give the Committee any facts with regard to the mode in which you meet the expenditure?—We, of course, have always had our expenses met by what we term the "whisky

*Mr. W.
Mannington.*

Mr. W.
Mannington.
8 May, 1907.

money;" but now, owing to the Education Act of 1902, the demands upon that fund for secondary education are so great that we cannot meet it out of that fund, and that is partly where the difficulty comes in, because it means a rate, and that has been the ground upon which the hostile action has been raised—in order to avoid the rate; but they cannot avoid the rate whether they carry on the college or not—I mean the demands of the elementary education are so great that we must have a rate, and we may as well face it; but that is the hope of some, that they will save it.

1992. (*By Lord Belper.*) What is your rate for secondary education?—We have not got a rate yet. I forget whether it is coming forward, or whether we have just passed it, but we are going in for a halfpenny rate. It is not in working yet.

1993. (*By the Chairman.*) You say a halfpenny rate has been proposed?—Yes, it has been proposed and it has been carried through the Council. The question is rather sprung upon me, but I believe that is correct—at any rate you may take it that it will be carried through the Council if it has not already been.

1994. Do you think that is insufficient?—I think we shall have to go for more, unquestionably; but we must have the rate, whether the college is carried on or whether it is not carried on; the college does not stand or fall by that.

1995. What is the amount of the grant that you receive from the Board of Agriculture?—£250 now; it has just been increased by about £50 two months ago.

1996. Are there any lectures given in the county?—Yes. Our agricultural lectures are confined to farmers' clubs throughout the county. Whenever they are asked for they get them, but we feel strongly—only it is not just the time to go in for it—that we want a second agricultural lecturer. We think a good deal of good will be done, particularly now that we have the sympathy of the farmers, by another good lecturer on agricultural subjects only. We also have a horticultural lecturer, and also a poultry lecturer who goes round the county and who has met with most extraordinary success. The interest which is taken in the question of poultry rearing and so on is really beyond our expectations altogether: we have a good many poultry on the farm.

1997. Your students work on the farm?—Yes.

1998. Your lecturers belong to the staff of the college?—Quite so.

1999. The farmers, you say, come to the college and ask for advice?—A good many do now, but Mr. Woodhead can give you more particulars about that than I can, because he is familiar with it all.

2000. You say now the farmers are quite favourable to the college?—On the whole, very.

2001. They understand its practical usefulness?—I think it is widely appreciated now. I think the fruit stations which we have all over the county have materially assisted that—I mean they have enlisted a sympathy which did not exist before. We have six fruit stations where we plant fruit and keep them in training and so on as an object lesson for the neighbourhood because they cannot all come to Uckfield.

2002. Are there any local committees throughout the county?—In what way?

2003. Local committees composed of farmers who recruit for the college and who control the experiments?—No; our lecturer goes out wherever there are experiments and watches them himself. Of course the farmer on whose land the experiment is carried out works with him, or rather he works with the farmer.

2004. Who sends out the notices of those experiments so that other farmers may come and attend?—We circularise them.

2005. That is done by the Education Committee?—By the agricultural sub-committee.

2006. Other counties do not contribute to your college?—No. Surrey and Kent have a college of their own at Wye, and West Sussex, for some reason or other, does not join in. There was some talk of West Sussex doing so some time ago, and I fancy that they will, after a time, join us. I think in the course of time changes will take place, and that will happen. I think there is a good strong feeling among some of the members of the West Sussex County Council in favour of it. My reason for saying that is that we have recently had a deputation from the West Sussex County Council on the subject—Mr. Hubbard was the chairman, and I think there is a strong feeling in

favour of some sort of joint action being taken, but it has not ripened yet.

2007. You are sanguine about that, that the West Sussex County Council will join you?—I am, personally, but I am speaking entirely for myself.

2008. (*By Lord Barnard.*) How is the college governed and managed and controlled?—Mr. Woodhead is the principal.

2009. I do not mean with regard to the teaching staff. Who is the governing body—who has the control of it?—The agricultural sub-committee.

2010. How often do they meet?—Every month.

2011. At the college?—Not always at the college. In very bad weather, when one does not want to go round the farm, we meet at Lewes.

2012. Do you go minutely into the organisation and the subjects of the curriculum and that sort of thing?—We go into everything as carefully as we possibly can.

2013. Do you control the finance?—Yes, subject, of course, to the County Council.

2014. You report to the County Council?—Yes—to the Education Committee rather.

2015. Who acts as your clerk or secretary?—Mr. Young, the organising secretary of the Education Committee.

2016. Do you consider that is a satisfactory method of working an institution of this kind—are you satisfied with it?—Absolutely satisfied.

2017. Are the members of the committee mostly, or perhaps all of them, engaged or interested in agriculture?—Several of them are. I am a farmer to a considerable extent, and I have four sons farming in the county, so that I am tolerably interested in agriculture, and I have one of my own boys at the college.

2018. Do you or the Committee ever meet the Government inspector there?—We have met Mr. Brooke-Hunt on two or three occasions, or more than that I think.

2019. Do you consider that the Board of Agriculture's intervention through Mr. Brooke-Hunt is of assistance to you?—I think it has been very useful indeed; we are very glad to have been in touch with him.

2020. You are satisfied with the control of the Board?—Entirely so. I think, if I may say so, Mr. Brooke-Hunt, who has been there several times, will confirm what I say as to the improvement that has taken place in many things.

2021. I see by the official report of the Board of Agriculture that there is nothing done in West Sussex at present in the way of agricultural education at all?—Nothing.

2022. Supposing West Sussex should consider that it could best carry on this work through your college, would you have to extend your college?—We should now, because we are quite full.

2023. You would want further buildings and more teachers?—Yes, we have plenty of room for extension: we have about four acres of ground.

2024. Is it freehold?—We are buying it. There is a £4,000 loan, and we are paying it off together with the interest.

2025. I am not familiar with East Sussex. Excluding of course any county boroughs, if there are any in the area, is agriculture the principal industry in East Sussex?—Certainly. That was recognised by the County Council, and that was the reason of the establishment of the college; it is purely an agricultural county.

2026. What is the nature of your 100-acre farm?—Mixed—arable and pasture. We keep a few sheep—we have only 100 acres, you see. We breed Southdown sheep; we keep shorthorn cattle, cross them with a Sussex bull, and rear our heifer calves; and we carry on a dairy, too. That is an addition that we have just lately made.

2027. In fact the work you carry on is typical of the agriculture of the district?—Yes.

2028. Do you grow hops?—No; I have myself, but we have stopped that. We had no oast and could not carry it on at the college, and I suggested we should do away with the hops. We had no oast, and I suggested to the Committee that it could not be carried on to any useful purpose, so we stopped it. I may say for the information of the Committee that when we took the farm about thirteen years ago, it was just about the time I entered on the Council. I opposed it for all it was worth because it was such an absolutely wretched farm. I said then, and I say here, that I would not have had it if they had given it to me rent free; but we have laid out a good

bit of money there as a county authority, and the farm is now in first class order, and to give it up at such a time as this seems to me an absolutely unwarrantable policy.

2029. Have you a lease of it, or is it only on annual tenancy?—Only on annual tenancy. Then the horticultural garden—I was not a party to it myself, and I have no responsibility for it—but we have laid out a good deal of money upon that, and that we shall lose altogether if we leave the farm. The thing is practically done, and we should have to give it all up and the landlord would take the whole.

2030. Since you have been associated with the work has it developed considerably?—Very considerably.

2031. Do you think there is scope for further improvement?—I think we shall have to meet it; I think it is a necessity.

2032. Do you think you will have to further develop the institution?—I think so. We have now 22 Sussex students, and at one time we had none.

2033. Naturally—I need hardly ask you the question—you think that development will necessitate further financial assistance?—Yes, but we are carrying on the college now at a less cost than before. We have extended the college, and got our farm into good condition now, and everything points to a less expenditure in the future. When I was appealed to as to what we should require, I said we could do with £300 less; but my Committee said we had better be sure of how we stood first, but everything points in the direction of economy.

2034. Do you look upon a further grant as indispensable to your further development?—I think it would materially assist our position at the present time; that is the crux of the whole thing.

2035. You would not expect that any further Government assistance should be given without perhaps conditions of some kind being laid down?—No, and I should welcome the advice or intervention of the Board of Agriculture; I think that would help us very materially.

2036. If you got further assistance from Government do you think that the Council would meet it by increased financial support?—I do not think we should require increased financial support from the Council itself—you see if we join with West Sussex, West Sussex will have to contribute their portion, and I do not think there is a possibility of our requiring larger support from our own Council.

2037. (*By Lord Belper.*) I just want to understand your financial position in East Sussex with regard to your grant for agriculture. The whole of the part of the grant that you devote to agriculture is paid to the college, is it not?—Yes.

2038. That amounts to £2,345?—That is it.

2039. Your grant from Government for secondary education is £7,120?—Yes. It is gradually getting less, but that is about it.

2040. That is the figure given for the last year?—Yes, that is about it.

2041. You hope to get a halfpenny rate which will amount to about £2,000?—Yes.

2042. So that you spend about £9,000 on secondary education?—Yes. We are now building a hostel at Brighton, and then we have the secondary schools. We are just building a new grammar school at Rye, and one thing and another, and also pupil teachers' centres, and the claims are very heavy for secondary education.

2043. Of course if you have to do it out of revenue, the annual expenditure may be rather heavy?—Yes.

2044. You have no funds apart from what you receive from the Government?—No.

2045. I suppose your county is largely agricultural?—Yes, mainly.

2046. Therefore, that £2,000, although it is a considerable sum, is not more for agriculture compared with other industries in the county?—No. Some ten years ago the rage of the county was—it amounted to a rage—that everything must be done for the benefit of agriculture. I remember opposing a level crossing over a light railway, but the Council would not hear of it, because, as they said, that light railway was going to be of such benefit to agriculture. That, however, has been pulled down.

2047. Can you tell me what the elementary education rate was for last year?—9d. or 9½d.

2048. Do the farmers think that that is a large extra sum cast upon them, many of them paying nothing for

education probably before the Act of 1902 passed?—They did pay rates then; there were a good many Board schools at that time.

2049. But in the places where there were no Board schools the 9d. rate would come as an unpleasant surprise to the farmer?—Yes, it did to myself. There was no Board school near any of my land, and now we have to pay more.

2050. That does create difficulties in the way of raising a further rate for secondary education for these other purposes?—Yes, and then there is a very strong feeling, amongst farmers particularly, and these secondary education people ought to pay for themselves—I am dealing with public opinion all round me—that they are over-educating the children, and they cannot get boys on the farms, and so on. Of course, there is a good deal of hard fact in it, but that is what you have to contend with.

2051. At all events, the fact that they have to put their hands in their pockets to pay a considerable elementary education rate makes it much more difficult for you to raise a secondary education rate?—Yes, just so.

2052. (*By Mr. Acland.*) I suppose you could roughly group the work you do under the work done on the farm, the work attended by the farm students there, the lectures on horticulture and poultry-keeping given throughout the country, and experimental and analysis work done for the farmers—those three branches, the farm work, the lectures, and the experiments and analyses? Which do you think of those three is most useful and appreciated by the farmers at the present time?—The farmers' lectures, and also the analyses; that is really all they participate in, you see.

2053. How many students have gone through the three years' course?—Mr. Woodhead will tell you that; I have not those figures.

2054. I gather that there has been a rapid development in poultry-keeping and fruit-growing by the small farmer in your county?—Yes, very considerable indeed.

2055. Do people find it fairly easy to get land?—That is one difficulty which hinders fruit planting. Of course in planting fruit, particularly apples, and so on, they must have security of tenure, otherwise a man is endangering his position very much if he plants a lot of fruit and has to leave his farm. Supposing he dies, and the farm has to be given up, all landlords are not alike, and some landlords would take advantage of it; and then, again, it is very difficult to bind a landlord down to any agreement when a man lays down a lot of his land for fruit-planting.

2056. There is plenty of demand, you think, for instruction?—Yes, that is evidenced by the attendance at lectures, which is extraordinary in both of those departments.

2057. Do you provide for the board and lodging of the students at the college?—Yes; 33 all lodge at the college.

2058. That makes you full?—Yes, quite full, and we have several applicants waiting for admission; when I say several, two or three.

2059. (*By Mr. Staveley-Hill.*) Do you have any system at the college for the training of teachers at elementary schools in your district?—We are instituting centres now. I am not on that committee, so I cannot give you any information about that.

2060. Do you have market-day lectures such as have been described to us by previous witnesses?—No, we do not have those.

2061. Is there any provision for veterinary instruction?—Yes, we have veterinary lectures. I did not mention that, did I?

2062. No?—We have veterinary lectures every week.

2063. At the college?—At the college.

2064. (*By Lord Moreton.*) Have you done anything towards teaching the sons of labourers on the farm?—No, we have not done anything of that kind, but I think our elementary schools committee is taking that question up a bit. You see they must have instruction where they are. I do not know what the committee are doing about it, but we are not dealing with that.

2065. You are not considering the question whether you could do good work by taking young labourers on the farm and giving them instruction?—There are not many young labourers about.

2066. (*By Mr. Latham.*) You spoke of your farm being

Mr. W.
Mannington.
8 May, 1907.

Mr. W.
Mannington.
8 May, 1907.

about 100 acres, and that you paid £100 a year for it?—Yes.

2067. Is that the rent now, or when you took to it?—When we took to it. We have the farm at the same rent, but we have increased our rent by certain arrangements with the landlord by which we have had certain buildings put up which we pay interest on. I think our rent altogether amounts now to £130 a year, but I am speaking from memory.

2068. The County Council up to now have supported the college?—Yes, and it does now.

2069. You are rather afraid it will not do so in the future?—There is a motion for a committee of enquiry to enquire into the college.

2070. I think you said you had 23 farmers' sons?—Twenty-two.

2071. How many pupils have you at the present time?—Thirty-six.

2072. Will you kindly tell us what the professions of those students' fathers are?—Mr. Woodhead has all those particulars.

2073. Will you tell us what these lectures are principally on?—I think it is limited to the demand from the farmers' clubs. They invite the lecturer to give a lecture on a certain subject.

2074. That is quite sufficient. You consult the farmers' clubs as to what sort of teaching they should have?—They invite us, and we respond.

2075. You said you grew hops, but that there were none grown now at the college?—Yes.

2076. Did you go to Wye to learn hop growing?—No, I did not.

2077. Does your county get any instruction in hop growing?—I had instruction in hop growing when I was a boy—

2078. I only want to know how your county does in the way of getting education for hop growing. Do they have to go to Wye College?—No, we do not.

2079. Would there be any wish that the agricultural education should be on much broader lines if you had more money?—If we had more money we should consider what we could do with it.

2080. You made the remark just a few minutes ago that that was what you would do if you had the money. You said if you had more money you could probably offer the farmers more in the way of teaching?—I do not think I said so, but if I did I did not mean quite that.

2081. I did not think you did mean it when you said it, but you did say it?—I meant to say that if we had more money we could do more and enlarge the work that we are now doing. My meaning was that if we had more money we could have more pupils, but I did not intend to say that we should widen our field of instruction.

2082. The syllabus here gives one the idea that you teach a good deal?—So we do—we teach land surveying, and chemistry is a very strong point with us.

2083. What you really meant to say was that if you had more money you would be able to have more students, and not that you might have a more extended curriculum?—We might have a more extended curriculum if it was necessary, but what we want to do is to meet the demand for instruction.

2084. May I ask one more question with regard to this veterinary hygiene that you were asked about by my neighbour. Will you tell us how far you go in the way of veterinary hygiene?—I live 30 miles away, and I am not present at the lectures, and I could not tell you that.

2085. Is there any feeling in the district with regard to the teaching of it?—Personally, I am not in favour of it. We went in for one department of it, and that was shoeing, but that was an absolute failure. We bought a concern in the South of England, and I was against that at the time, and we sold it the other day for £5.

2086. How far have you gone in that way?—It is not practical. As far as I have any influence with the college, and I have a good deal, it is to give the students a good practical knowledge. They have the opportunity which I never had of learning scientific farming there, but they must have a practical knowledge as well. Without the practical knowledge it is no good at all, and that is not practical, to my mind.

2087. What is not?—Shoeing.

2088. Not practical?—No; I do not think a farmer

ought to shoe his own horses. I think he could employ his time much better in other ways.

2089. If he knew how to shoe his own horses he could tell whether his horses were shod badly or whether they were shod well?—All I can say is I have never shod a horse in my life myself, but I can tell whether a horse is shod badly or whether it is shod well.

2090. Yes, I should say you could. I should say you are a very good judge of whatever you see?—I am afraid you are speaking ironically.

2091. No, I have never seen you before, but I can tell from your evidence pretty well what you are?—Thank you.

2092. (*By Mr. Medd.*) Have you an Agricultural Committee in your County Council?—Yes, I am Chairman of it.

2093. All the agricultural and horticultural instruction is done by the County Council?—Yes.

2094. At the commencement of each year do you formulate a scheme to cover the whole of the instruction of the county, or are these lectures given spasmodically, so to speak, or just on demand at any odd time?—They are given outside just when asked for.

2095. You do not at the commencement of the year attempt to sketch out a scheme for the whole country; you depend on application for lectures from time to time?—Yes, and we have quite enough to do to meet those.

2096. I can quite understand that, but of course, looking at the Report on your work in East Sussex, there are certain gaps. You hope to make some provision for the training of teachers, do you not?—Yes, but that is independent of this college altogether; we have nothing to do with that.

2097. Probably the facilities for the training of the teachers could be or would be provided at this college?—No.

2098. You would not provide those facilities?—No.

2099. I may say that such facilities are provided at many of these colleges?—There is no thought of that at our college.

2100. With regard to continuation schools, you do not provide any horticultural or agricultural instruction through your continuation schools?—No.

2101. Nor have any of your elementary schools school gardens attached?—No.

2102. Those are all features in which interest, and, to some extent, knowledge may be imparted in agricultural matters?—Yes.

2103. Do you think that your Agricultural Committee would be willing to submit annually a scheme covering the agricultural instruction of the county to the Board of Agriculture for advice and suggestions?—I see no objection to that at all; we want to learn as well as to teach.

2104. Exactly, and you have spoken very highly of the assistance that Mr. Brooke-Hunt has given you?—Yes.

2105. Do you ever consult the Board of Agriculture in other respects in reference to the work of your county, apart from the college itself?—No, we have had very little communication with them; only his visits, and the visits of the President.

2106. Do you not feel, as a practical farmer, that you would get some assistance from the experience of the Board with regard to different types of instruction, and so on?—Yes.

2107. I see you have classes for farmers' sons?—Yes, but they are not responded to.

2108. I was going to ask you what the farmer thinks of those?—They have not been taken advantage of at all.

2109. Is not it the most difficult problem in agricultural education to attract the sons of small farmers and the small farmers themselves?—Yes, it is; but, of course, there are reasons why they cannot take it up.

2110. What should you think are the objections of the small farmer?—In the first place, he has opportunities at home, and he likes his home better than going back to school again. I tried hard to get my son, next to the one who is at the college now, to go to the college; he was living at home with me learning farming before he went into business, and I tried hard to get him to go to the college for a twelve weeks' course, but I could not get the boy to go, and I take that as a key to the whole thing. Then, of course, there is the expense; small farmers cannot stand it.

Mr. W.
Mannington.
8 May, 1907.

2111. Probably you are a large farmer yourself?—Yes, I am a large farmer myself.

2112. If you had the money in East Sussex, what particular forms of instruction do you think would be most useful for small farmers and their sons, or for the cultivators of small holdings? What would you suggest?—I think chemistry is a study which is most valuable. I miss it every day myself, and I only wish I had had the same opportunity when I was young of acquiring a knowledge of it.

2113. Then you would suggest these short courses that you already provide?—I think so, and land surveying and that kind of thing.

2114. I was trying to find some means by which you could suggest the difficulty you experience now in attracting them could be overcome?—Yes.

2115. Of course it is a most difficult problem?—The one question is money.

2116. And the disinclination to spare a lad who is wanted on the farm from the farm?—I think that will come, because the men themselves are becoming better educated, and I think they recognise the advantages a boy would get by attending.

2117. If we are to have small holdings we must have the men trained to cultivate them. What would you think a most appropriate training for a young man of that type?—I cannot see where they could have a better training than at such an institution as ours.

2118. But then the question of money comes in?—Yes.

2119. Do not you think you might be able to provide attractive instruction for them, say beginning at the age of 14 up to 16 or 17?—That is our very aim, because what we want to do is not to let the boys have a year or two away from school first, but that they should come straight from school to the college, and we limit the age now to that end, because we think it is much better for them to do that.

2120. Mr. Woodhead can tell us the limits with regard to age, and so on?—Yes.

2121. (*By Prof. Middleton.*) You told us that your lectures have been very successful. Do you have any lectures or demonstrations at the college farm? Do you get the farmers to come round and see the farm?—Anyone can who likes, but of course there is this difficulty that farmers live so wide apart, and it takes so long to get to and from.

2122. I take it that these lectures to which you referred, were lectures given in school rooms and so on?—Yes.

2123. Not in the open in connection with demonstration plots?—No, we have no demonstration plots.

2124. So that you can have no lectures in connection with them?—The lectures are generally at the farmers' clubs; most of the farmers join these clubs.

2125. You referred to the facilities of analysis being taken advantage of by the farmers in your county, and you said that that form of work was attractive to the farmer?—I think so, judging by the increased number of analyses that we have now.

2126. You have a distinct increase?—Yes, but Mr. Woodhead will have full particulars about that.

2127. There is only one other matter I want to ask you about. To go back to the subject of shoeing which you said was a failure in your county, can you explain in any way why it failed, beyond by saying that it was not practical? Do you mean you had not got a practical teacher?—No, we had a practical teacher, and we had a shoeing shop, and all the materials.

2128. Did the country smiths take no interest in it?—The country smiths were all up in arms against it, but they need not have been frightened, because there was no enthusiasm over it, and for my part I do not think it is a practical thing.

2129. You mean the country smiths knew more than your students did?—I think they ought to, and I think they would know more even after the students had learned all that there was to be learned.

2130. (*Mr. Davies.*) Are the agricultural conditions in West Sussex the same as in your particular district?—Pretty much so; there are just a few hops, but the conditions are practically the same.

2131. Then your college would meet their requirements if they were to join with you?—Yes, I do not see why not.

2132. Supposing the Board of Agriculture increased the grant they make to you, do you think that the West Sussex County Council would join in the scheme?—I cannot say; I have no means of knowing. I only know that when we met a deputation from that Council several members were very sympathetic, but it fell through, and I gather—at least I believe I am right in saying it—that a certain portion of the Council were against it.

2133. I think you told the Committee that in West Sussex they have no agricultural lecturers ever going through the county at all?—No, we let our lecturers go there sometimes, when they ask for them.

2134. Then they pay for them of course?—Yes, they have paid for them.

2135. I think you told us that your students worked on the farm?—Yes.

2136. Do you pay them for working on the farm?—Oh, no; I do not think that the labour we get from our students is worth anything.

2137. Do you make any conditions that a student, before he comes to your college, has spent a certain amount of time on a farm?—Yes, unless there are certain reasons why he should not have done. There are one or two who have not been on a farm much, but nearly all have. Some of them take particularly to horticulture, and they confine their attention to that, and there is plenty to interest and occupy them there.

2138. That is a condition laid down before a student is accepted, is it?—As a general rule they have all been on a farm.

2139. I think you told us that the college is a residential one?—Yes.

2140. You differentiate between the students who come from your own county, and the students who come from outside?—Only in the matter of terms.

2141. What fees do the students from your own county have to pay?—£50 a year for the county, and then they have an opportunity of getting a scholarship of £30 a year.

2142. How are the scholarships awarded?—By examination.

2143. Held by the college authorities?—Yes.

2144. You have no classes outside in the country districts?—No classes, except such as are formed locally, and who invite lecturers and we supply them with lecturers.

2145. At the farmers' clubs?—At the farmers' clubs and also on matters of horticulture anywhere. Our horticultural lecturer goes widely round the whole county and he has done a lot of good.

2146. But there are no evening classes specially for farmers' sons?—No.

2147. With regard to the analyses is that a paying concern?—Yes, that pays.

2148. Does the County Council make a grant towards it, or does each man who wants an analysis made have to pay a certain fee?—Everybody who wants analyses made has to pay a fee.

2149. That covers the cost?—Yes. There was a motion some time ago made by the County Council that farmers should have the analyses free, but I opposed it as a farmer, because I do not think it is any good to have these things too cheap, and as a matter of fact, it is mostly large farmers who require these analyses made and they are in a position to pay for them. Small farmers do not require them so much, because they do not deal with such large quantities, and whenever they want information of that sort they mostly go by what they are told by others. Therefore, we would have been letting a lot of men have for nothing who could well have afforded to pay for.

2150. Do you carry on any field trials in different parts of the county?—Yes.

2151. Do the farmers come to see the results of those?—Yes.

2152. Are they followed by a lecture?—Yes. That generally takes place at the farmers' club.

2153. Not on the ground itself?—Not, on the ground itself.

Mr. S. A. WOODHEAD, Principal of the Agricultural and Horticultural College, Uckfield, called and examined.

Mr. S. A.
Woodhead.
8 May, 1907.

2154. (*By the Chairman.*) As regards the courses of study at your college, you have a three years' course qualifying for the diploma of the college?—Yes.

2155. Perhaps you will describe to us what that course is?—A diploma course includes everything that we teach at the college. The students must attend for three years and must pass all examinations of course, and a final examination as well. That is the diploma course. Then there are four certificate courses. They can take either the agricultural certificate, or the horticultural certificate, or the poultry-rearing certificate, or the certificate in surveying. In any case they must attend for two years, and take certain subjects. For the agricultural certificate they take agricultural botany, chemistry, geology, elementary mensuration and surveying, book-keeping, veterinary hygiene, carpentry, physics and agriculture; for the horticultural certificate they take horticulture, carpentry, agricultural chemistry, agricultural botany, and agricultural entomology; for the poultry-rearing certificate they must take poultry rearing, carpentry and entomology; and for the certificate in surveying they take the Surveyors' Institution course. Practical work in all the above courses is compulsory.

2156. Is there any book-keeping?—Yes, book-keeping comes under the head of the agricultural certificate.

2157. Then you have a separate class for land agency students during the winter?—Yes, that is so, from October until the examination in March.

2158. Is that a course of one year or two years?—It is only held during the winter; it is not really a course, it is a sort of coaching class for the examination. Some students in land agents' offices come to the class, and we have a certain number in the college who are going in for it—generally one or two per year.

2159. Do you consider after that course that they are qualified as land agents?—No, I do not say that. Some of them are in land agents' offices, but those who are going in for the college course must attend for two years. It has been decided by the Surveyors' Institution that they must go through our full two-years' course before they can sit for the examination, but we specially coach them in the winter, along with the evening students.

2160. First of all they take the certificate course?—That is so, and at the end of that time, if they take our two-years' course they can sit for the Surveyors' Institution examination as well, but they cannot take the Surveyors' Institution examination until they have completed our two years' course.

2161. They must have obtained a certificate for the two years' course, and then they have a winter course in addition, is that it?—No. Suppose a student enters in May, and stays with us two years, at the end of that two years he can take our certificate, and the Surveyors' Institution as well, but if he is in a land agent's office he attends the winter course only.

2162. Then they are outside students who attend the winter course?—They are outside and resident students.

2163. A certain section of students attend the two years' course and get a certificate, and then pass the Surveyors' Institution examination, and that is recognised by the Surveyors' Institution?—Yes, that is the case, only they need not necessarily get our certificate before taking the Surveyors' Institution examination, but they must have attended our two-years' course.

2164. There are other students who are already in land agents' offices, and they attend the winter course?—Yes, they generally attend for agriculture, agricultural chemistry and geology. We do not take any other subjects. Those are the three subjects in which they really cannot get instruction in a land agents' office.

2165. What is the number of students who take a two years' course, and what is the number who take the winter course?—All our students are taking the two years' course, except one who has been with us for three years. He is waiting until he is old enough to go in for the Surveyors' Institution examination.

2166. Then you have a 12 weeks' course for farmers' sons?—Yes, that is from November to the end of February.

2167. Is that well attended?—No, we have no room for them; we get so many two-years' students that we have no room for any short course students at all.

2168. Is that 12 weeks' course in existence or not?—No, not at the present time. We have no one attending it.

2169. That is only what you propose to do?—No; we tried it one year, when we had, I think, two vacancies, but no one applied, and since then we have not had room for them at all.

2170. Do you consider that it is an urgent need that provision should be made for the sons of farmers in that way?—I think so, certainly.

2171. Will you give us the total number of students who have received instruction during the last five years?—115.

2172. There has been a gradual increase during that time?—Yes, a gradual increase during that time. We started at 19 and now we have 36.

2173. Then the type of student who attends?—Thirty of these are sons of farmers but in 26 cases their parents were deceased. I can safely say that 13 of those also were farmers. There are 16 tradesmen's sons, 11 from the professions, eight from the army, six schoolmasters, five clergymen, three bank managers, one missionary, five men of means, and four unknown.

2174. Fully 80 per cent. I see of the past students are at present engaged in farming, horticulture, poultry-rearing, or land agency?—That is so. There are 68 per cent. farming (that is including horticulture and poultry-rearing), and 15 per cent. engaged in land agency.

2175. Do any of your students, taking the diploma course, afterwards take up the teaching of agriculture?—No, our course does not go far enough to produce lecturers.

2176. Your course is distinctly intended for farming?—That is so.

2177. Then which side of the college work do you consider is the most important?—Certainly the agricultural side; but horticulture and poultry rearing are very popular.

2178. In the county?—Yes, they are very popular indeed at present.

2179. Do you think that more lectures to farmers throughout the county than are at present given might be given?—In the county on agriculture?

2179A. Yes?—Certainly.

2180. Do you think that that might be encouraged by starting local committees who might give encouragement to farmers and invite lecturers to come there and give lectures?—Yes, I think you might do it in that way.

2181. Mr. Mannington has already told us that at first there was much opposition to your work, but that now that opposition is no longer in existence?—That is so. Our correspondence, consequent on applications for advice, is now so great that we will have to take steps shortly to deal with it.

2182. Can you point out what part of the work is, more than another, of most interest to the agriculturists?—I do not think I can name any one part more than another, unless it is the experimental work. Of course, in the summer farmers are very interested in that, and also in the analytical work under the Fertilisers and Feeding Stuffs' Act.

2183. The lectures which are given during the winter bear, I suppose, on the experimental work which has been carried out during the summer?—That is the case.

2184. That of course increases the interest and the attendance at the lectures?—Yes. It is not so in the case of the horticulture and poultry lectures throughout the county. Those are arranged in autumn. We have given 55 lectures at 11 centres on poultry-rearing throughout the county in addition to the agricultural lectures, and 60 lectures on horticulture at 12 different centres.

2185. They are given at various centres throughout the county?—Yes.

2186. (*By Mr. Latham.*) May we ask what was the average attendance at those lectures?—The average attendance at the horticultural lectures was 40. The averages at the poultry lectures were 66, 76, 78, 50, 51, 40, 59, 34, 101, 42, and 54. I may mention that in one case a lecture was given at a village in which there were not

more than 200 inhabitants, and we had 120 people there.

2187. (*By the Chairman.*) You would desire to have a second lecturer on agriculture?—Certainly.

2188. You have only got one now?—Only one.

2189. You have no provision for the training of elementary teachers?—None whatever.

2190. (*By Lord Barnard.*) Would you mind giving the Committee a word or two of information about yourself? How long have you been at the college?—Ten years—five years as lecturer and five years as Principal.

2191. Were you engaged in the teaching of agriculture previously to that?—No, and I am not engaged to teach agriculture now; I teach agricultural chemistry.

2192. Are you personally associated by family ties with farming?—Yes, certainly.

2193. Are most of your staff men who have been brought up on farms—practical men?—Yes, very practical men indeed.

2194. Would you tell us the age at which your students come as a rule?—17, and we have them now up to 29, but most of them are from 14 to, say, 20.

2195. What sort of preparation have they had before they come to you usually?—Very poor indeed.

2196. Some of them from elementary schools?—Yes, and they are very badly prepared indeed—that is our difficulty.

2197. Do many of them come from elementary schools?—Some of them. I cannot state exactly how many, but several do.

2198. Have you many secondary schools in East Sussex?—No, very few.

2199. Would it be an advantage if the boys were better prepared? Could you confer greater benefits upon them?—I do not think we will make very much progress until they are. The boys from elementary schools are so badly prepared that they cannot even follow our lectures, and the lectures are made as simple as possible. Many of them cannot follow them, and some of them cannot take notes of them.

2200. Do you think it would be an advantage if a uniform system of tests were adopted throughout the country for these diplomas or certificates?—It would be a very great advantage indeed.

2201. Are your diplomas always granted on the result of examination?—Not altogether on the examination. In the prospectus we state: "It must be strictly understood that attendance at lectures and practical classes does not qualify for entrance to the diploma examination or the certificate examination. The general work of students will be taken into consideration. Any student may be refused admission to the examinations if in the opinion of the Principal he has not conscientiously followed the prescribed courses. Exception will be taken especially in the case of those students who cram for examination purposes."

2202. Do you ever refuse to admit students to the diploma course?—We have none in for the diploma at present. It is a three years' course, and we only have them for two.

2203. You profess to give instruction in land surveying and the other businesses and professions connected with agriculture?—Yes.

2204. I do not see in the Board of Agriculture report on your college that forestry is mentioned at all. Do you give any instruction in forestry?—None whatever.

2205. There is a very considerable area of woodland in East Sussex, is there not?—Yes, fairly large.

2206. Are a certain number of labouring men employed in the woods?—That I cannot say.

2207. You cannot tell me whether you think it would be an advantage if systematic instruction in forestry were given in the district where woods exist, as they do in East Sussex?—I would not care to answer that question, because I do not pretend to know anything at all about forestry.

2208. (*By Mr. Acland.*) You say that farmers take great interest in the experiments that you do. What sort of experiments interest them most?—I will give you a list of our experiments.

2209. I should like to know those that really are most interesting to farmers?—The experiments on the manuring of meadow land for hay, lucerne experiments, manuring of mangolds, and manuring of potatoes. We have four centres for these experiments.

2210. Is the chief interest displayed in the experiments in manuring?—Yes, chiefly.

2211. Do you think, as interest in your courses develops, you would be able to require a certain standard of secondary education of students with advantage?—We shall be compelled to do so. I do not see how we can go on as we are with the training they have before they come to the college.

2212. You are very severely handicapped by the lack of secondary education in those who come to you?—That is so.

2213. You require something better than is given in the ordinary elementary school?—Certainly, something a great deal better than that.

2214. Have you thought of it as a possible thing to require a standard of elementary education for students?—There is one point here that I should like to draw your attention to. I think that by offering, say, practically free scholarships to sons of farmers who have attended elementary schools and who have reached a certain standard of excellence in those schools, it might do some good; it would make the boys stay at school a little longer.

2215. You are referring to elementary schools?—Yes.

2216. You would not require attendance at a secondary school?—It would be better, but our instruction is so elementary in the first year that if a youth has passed the 7th standard at school he ought to be able to follow it easily. We accept the headmaster's report in lieu of an entrance examination; but in some cases, although the report is satisfactory, the boy is quite hopeless at certain work, which is a great drawback.

2217. You do not regard it as essential to ask for a higher standard of secondary education?—Not at our college, because our work is very elementary in the first year.

2218. Do you think, if it was the habit to send boys to secondary schools until the age of 15 or 16, it would be much easier for you to do your work, because they would be better prepared?—Certainly, and they would do better work also when they come to us.

2219. That is not the habit at present?—No, not at present.

2220. (*By Mr. Lamont.*) I should like to ask you a question with regard to West Sussex, whether you can give the Committee any more information than we have yet received as to why West Sussex has not participated in any way in your college?—I cannot give you any information whatever with regard to that; I do not know.

2221. They have a very much larger area of forest land in West Sussex than you have in East Sussex, and I put it to you whether they would not be more likely to co-operate with you, and more willing to co-operate with you if a definite course of instruction in forestry were given at your college?—It is quite possible that they might, but I do not think it is the lack of instruction in forestry up to the present that has kept them away. I cannot, however, give you any definite reason.

2222. (*By Lord Moreton.*) Do you send any pupils up to the National Diploma Examination?—Yes; I think we have put through altogether seven or eight.

2223. And also to the examinations of the Surveyors' Institute?—Yes.

2224. In your opinion would it be better if what is now called the National Diploma Examination was conducted on a different footing altogether—on such a footing for instance as this, the Board of Agriculture appointing an advisory committee to do the work, that committee consisting of representatives of agricultural societies and other bodies?—I think so. I think it would be better than it is at the present time.

2225. Why do you think so?—That is my opinion.

2226. You formed your opinion on reasons, I suppose, and will you give us your reasons please?—I do not think at the present time the National Diploma is a test at all. It certainly is not a fair test; a student may pass the examination, and may know little or nothing about practical agriculture. I think if the opinion of an instructor in practical agriculture was taken upon the candidate's work it would be better. At present, however, no practical examination is held. A candidate may get all his knowledge from books, and pass the examination without having any practical knowledge whatever. That is my opinion: the examination is not practical enough.

2227. (*By Mr. Latham.*) Are the students confined entirely to the sons of farmers and land agents?—No, there are 18 tradesmen's sons, 11 from the professions, 8 army

Mr. S. A. Woodhead.

8 May, 1907.

Mr. S. A.
Woodhead.

8 May, 1907.

officers, 6 schoolmasters, 5 clergymen, 3 bank managers, and one missionary.

2228. They are, we must suppose, all being more or less taught agriculture?—Yes, and of the past students over 80 per cent. are at present engaged in farming, horticulture, poultry rearing, or land agency (of which 68 per cent. are in actual farming, and 15 per cent. in land agency.)

2229. You say you have a 12 weeks' course for farmers' sons during the winter, and that they are very badly attended?—They are not attended at all.

2230. Will you tell us what that course is?—The course would be one of elementary agriculture, agricultural chemistry, elementary botany, book-keeping, veterinary work, and elementary mensuration chiefly, but they would also be allowed to attend any elementary class in the college.

2231. Have you tried extending it by holding courses in the summer that might be more interesting to them?—No, we have not tried that.

2232. Do not you think it is practically impossible to get them to come to these 12 weeks' courses in the winter?—It is at the time of the year when the farmer's son has least to do.

2233. Chemistry, for instance, is such an absolutely dry thing to start them with that it might disgust them before they got any further?—I think chemistry does in some cases, but not in all.

2234. There is not the slightest doubt that it does disgust some, I am very sorry to say. If the 12 weeks' course in the winter does not attract them in the way in which it is offered to them, would not it be better to have a 24 weeks' course, say, and divide it into two parts of the year?—Our course consists of 12 weeks, part of which is in one year and part in the next year.

2235. But they are both in the winter?—Certainly.

2236. I strongly advise something of the kind being tried. Do you know anything of the shoeing classes that Mr. Mannington has told us about that were such a great failure?—Nothing whatever; that was before my time.

2237. Can you give us any idea how far your instruction in dairying goes?—Each student has 12 lessons in butter-making; we do not take cheese-making at all.

2238. I see you say a six weeks' course in butter making?—Yes, of 12 lessons; they have two per week for six weeks.

2239. What time of the year is that?—That is all the year round; we send the students in batches of six, and they have 12 lessons; then their course in butter-making is completed, and we send another batch.

2240. Are they proficient butter-makers in six weeks?—They ought to be fairly proficient.

2241. And know all the ins and outs of the dairy?—No, I will not say that; that is quite another thing.

2242. Are these stationary dairies?—Yes, on the farm.

2243. Have you ever made any tour through the county with dairy schools?—I think some years ago they had a dairy van round the county, but I do not know why they gave it up.

2244. Was it not a success?—I cannot say; it was before my time.

2245. I see in the first year you do not give any attention to estate management at all, and in the second year you do not teach book-keeping?—That is so.

2246. Can you give us any reason why the book-keeping is left off after the first year?—In one year we consider a youth ought to know enough book-keeping.

2247. A youth who comes at 14 or 15?—Yes.

2248. He would be a very smart youth to learn book-keeping in a year, would he not?—But our students are not all 14; most of them are from 16 to 20, and some of them have done book-keeping before they come to the college.

2249. But these boys that you take at 14 you teach book-keeping to in the first year?—Yes.

2250. Then at the end of the first year you do not go on with it?—That is so.

2251. Do you not think that the very time you stop is just the time you ought to go on?—It depends upon the student.

2252. (By Dr. Somerville.) I think you passed through the course of instruction for the degree in the college at Newcastle?—Yes.

2253. And graduated at the University of Durham?—Yes.

2254. You came on, if I remember rightly, did you not, with a county scholarship?—That is so.

2255. I suppose we may take it that if you had not been assisted by a county scholarship the probability is you would never have gone through an agricultural course to the extent which you did, and possibly that you would not have been occupying your present position to-day?—That is so to some extent. I certainly might not have gone in for agriculture; I think I might have gone in for medicine.

2256. I suppose you went in for agriculture partly as the result of accidental circumstances, namely, the obtaining of this particular scholarship?—Well, I had thought about taking up agriculture, having been in the country all my life; but I had not really made up my mind until I got the scholarship. There were several scholarships offered, and I got the agricultural one, so I took it.

2257. In that particular case you came with a scholarship to an institution that was not in the county that had granted the scholarship?—Yes.

2258. For this certificate that is given by your college have you outside examiners?—No, none whatever.

2259. Is the examination entirely conducted by the members of the staff?—Yes.

2260. Will that be the case also when you grant a diploma?—Yes, as far as I am aware at the present time.

2261. Is this arrangement the result of insufficiency of funds to meet the fees of additional outside examiners, or is it the result of your conviction that the system is a good one?—I do not think it is a question of money at all.

2262. Are you satisfied that the results of an examination conducted entirely by the teachers of the candidates are perfectly unbiassed?—They ought to be; they are in my own case, but I think it would be better to have outside examiners; I admit that point.

2263. But still you have decided not to have them. Do you keep in touch with students who have passed through your college?—Some; not all.

2264. You have nothing in the nature of an old students' association?—Nothing whatever.

2265. Do you not think that good work lies before such an association?—Yes, I think so.

2266. You perhaps have not seriously considered the matter?—No, I have not thought of it.

2267. Who arranges these field demonstrations that are a feature of your work?—The lecturer on agriculture draws up the scheme. This is presented to the Agricultural Sub-Committee. If approved, the lecturer carries out the work, my duty being to see the Committee's instructions are carried out.

2268. He frames the details?—He does.

2269. You do not?—No, I do not.

2270. (By Mr. Medd.) I should like to ask you a question in reference to the short courses for farmers' sons. Have you had any pupils for those?—None whatever.

2271. Do you attribute the cause of that to the want of accommodation, or to the indifference or hostility of the farmers?—I do not think it is the want of accommodation.

2272. Is it purely prejudice?—I think so.

2273. In regard to the age of admission, the minimum age of your students is 14?—Yes.

2274. What would be the maximum age of those you have now?—29; but we have only one at 29, and the others are below 21.

2275. You have pupils ranging from 14 years of age up to 29?—Yes.

2276. The total number of your pupils is 36?—Yes.

2277. Those pupils ranging from 14 to 29 must vary very considerably in attainments and qualifications?—Yes.

2278. Do you not find the classification of them extremely difficult?—Extremely difficult.

2279. Must not this difference in age and attainment entail considerable additional expense both in regard to staffing and the arrangement of the classes, and so forth?—Yes, I think it does to some extent, but not so much in staffing as in arrangement of classes.

2280. It probably does?—Yes, certainly, to some extent it must.

Mr. S. A.
Woodhead.

8 May, 1907.

2281. Because in looking at the Report the total expenditure upon the college as compared with the number of pupils is high?—Yes, but the cost of the college includes all county work.

2282. Have you met with any institution of your size attempting to cater for boys of 14 and at the same time for men of 29?—Yes, I think there is another institution, or there was one in Cheshire, which does.

2283. You refer to the College at Holmes Chapel?—Yes, it used to be so, I think, with them.

2284. I think you will find that their pupils are now from 14 to 17 or 18?—Yes. We used to admit at 16, but we lowered the age to 14 in order to get the youths when they came out of the elementary schools.

2285. With regard to the economy of time and economy of money would not your college be more likely to improve in working if it confined itself to students from 14 to 16 or 18 or to students of above 18?—You mean admit only at a certain age or between two ages?

2286. Yes. Confine either the admission to pupils of 14 up to 16, or from 18 onwards?—Yes, and it would certainly be easier to work, too.

2287. You, in other words, are attempting now to combine intermediate and advanced agricultural instruction?—I cannot call our instruction advanced.

2288. Yet you aim at the National Diploma as a sort of *terminus ad quem*, do you not?—That is only in the case of those students who are specially coached for it.

2289. Then do you give a special preparation for a few selected students?—Yes, in the evening.

2290. I cannot help thinking that every institution must suffer in organisation and in efficiency when it attempts to provide for pupils of such very varying ages and attainments. You must be conscious of that yourself as principal?—Yes, I am.

2291. I am sure you must be, and if you could confine yourself more specifically to definite ages, probably the general work of the college would be improved?—It ought to be.

2292. You do not as yet provide any facilities for the training of elementary teachers, but I suppose the college could, as elsewhere, afford facilities?—I cannot say anything about that as yet.

2293. It has not, perhaps, been considered?—No.

2294. Do any members of your staff give assistance outside in the county otherwise than by way of lectures. Have they done anything hitherto for continuation schools?—Nothing in that line. Of course, we have answered letters asking for advice, and so on.

2295. (By Mr. Middleton.) Your usual length of course is two years?—Yes.

2296. I may take it with your 36 students you will have an entry of perhaps 18 or 20 fresh students each year?—Yes.

2297. Not many drop off in the second year?—Occasionally, but we soon fill up again.

2298. You are not seriously troubled with dropping away in the courses?—No, I cannot say we are.

2299. You have been doing a great many analyses?—Yes.

2300. Are you an analyst under the Sale of Food and Drugs Act for the county?—Yes, and under the Fertilisers and Feeding Stuffs Act.

2301. In sending your reports to the farmers do you give them any advice as well?—Yes; not on the official report, but privately by letter.

2302. About how many samples do you have?—Last quarter I had 20 under the Fertilisers and Feeding Stuffs Act, but under the Food and Drugs Act I had 120.

2303. (By Lord Barnard.) Are you the official analyst under the Fertilisers and Feeding Stuffs Act for the county?—I am.

2304. (By Mr. Davies.) May I ask what the staff consists of besides yourself?—A lecturer on agriculture; a lecturer on mensuration, book-keeping and estate management; on horticulture; on veterinary hygiene; on poultry farming; an instructor in carpentry, and one in smith's work; a laboratory assistant; and an instructor in dairy work.

2305. How many is that?—Nine.

2306. Of the 36 students how many of them come under the three years' course?—None at the present time. We have no diploma students. We have one student who

has been with us for three years, but he is really waiting until he is old enough to take the Surveyors' Institution examination.

2307. For the two years' course how many have you?—About half.

2308. About 18 that is?—Yes.

2309. Are they with you all the year round, from one year's end to the other practically, except their vacations? Certainly.

2310. There are no students at all in the twelve weeks' course?—None whatever.

2311. So that all your energies are directed towards getting the two years' student ready for the diploma?—For the college certificate if they take it, but many of them do not take the college certificate; they take agriculture, horticulture or poultry farming without taking the certificate.

2312. But they have to pass some examination before they leave the college, do they not?—No; they are not compelled to do so.

2313. They can come and stay there without passing any examination?—Yes, many of them do without taking the final examination for certificate; but they must take the examinations at the end of each term.

2314. I understood that there were a certain number of scholarships awarded by the County Council?—Yes.

2315. How many of them are there?—Five of £10 at the present time, and I think we have four students with scholarships of £30, if I remember right. I have not the exact numbers with me.

2316. So that about half your students get scholarships?—No, not half of them. Perhaps you mean from Sussex?

2317. Yes.—There are 22 from Sussex at the present time.

2318. If you have nine scholarships and 18 students coming each year it would be half?—Yes, that is so; but we only admit nine scholarship students during the two years.

2319. You were complaining just now that the type of student who comes to you is very backward when he arrives. I understand you have an examination before the scholarships are awarded?—Certainly. I am not complaining of the scholarship students at all, only of those who come in without scholarships.

2320. The scholarship students are able to appreciate your lectures?—Certainly.

2321. Do not the scholarship students have to pass an examination before they leave the college?—Yes, they have.

2322. They are on an entirely different footing from the others?—An entirely different footing altogether.

2323. The students from Sussex pay £50 a year, and the students from outside £70?—£50 for the students from Sussex, and £75 for those outside the county.

2324. Are those fees sufficient with the grant you get from the Board of Agriculture to maintain the college?—No. The students from without the county pay for themselves quite well, but the £50 paid by county students will, I think, just cover expenses.

2325. Who makes up the deficit?—The County Council.

2326. How much is that?—I do not keep the books, so I cannot give you that very definitely, but I think it is about £1,200 a year.

2327. You do not do any dairy work in the college, do you?—Only a six weeks' course for dairy students. All students attending the college and taking agriculture must take dairy instruction for six weeks—twelve lessons.

2328. Who gives the lectures in dairying?—We have a dairy instructress; she is really the farm bailiff's wife.

2329. She is only employed for six weeks in the year?—No, she is employed the whole year, because we send them in batches of six to the dairy—they attend every week for six weeks, taking generally two lessons per week.

2330. I understood there were field trials in addition to the lectures carried on in the county?—Yes.

2331. Those are carried on by the college?—Yes.

2332. Who pays for that work?—The County Council.

2333. That is included in the £1,200?—Yes, and the lectures outside as well—they are all included.

2334. Do you consider the student before he comes to your college should have had some practical experience on a farm?—It would be better if he had, I think.

2335. But you do not make that an absolute rule?—No.

Mr. WILLIAM ASHCROFT, Chairman of the Joint Committee of the British Dairy Institute, Reading, called and examined.

Mr. W. Ashcroft. 2336. (By the Chairman.) You are Chairman of the Dairy Institute Joint Committee?—Yes.

8 May, 1907. 2337. And Examiner at the Institute for the British Dairy Farmers' Association?—I am.

2338. Perhaps you will say something as to the condition of dairy education twenty-five years ago?—I should say that twenty-five years ago it was quite impossible, or nearly impossible, to get any information on dairying from any institute; there were nothing like the number of institutes that there are at the present day. It was extremely difficult to get a properly qualified dairymaid, and no one, practically speaking, seemed to know anything about butter-making, and of course cheese-making was only in a few hands. I grafted dairying on to my own mixed farm about thirty years ago. I got a dairymaid from Devonshire, and I think for a good long time she systematically overchurned the butter that was made. Mr. Jenkins, of the Royal, was the only possible instructor at that time, and he used to advocate the need of churning the butter after the French method, and consequently, following his advice, I changed the system in my dairy and I should think for a very considerable time my butter was consistently underchurned, and one fault was about as bad as the other. Then seeing butter made at a show or two by churn makers, I thought it wise to change my method. I changed it to a really proper way of making butter, and the thing was put right. That is what happened in those days, but if the thing happened nowadays I should not have the slightest difficulty in acquiring information or getting a dairymaid. That simply shows the difference between what you can learn now and what you could learn then.

2339. The supply of dairy education at that time was practically nil?—That is what I should say.

2340. And, from your personal experience you state that there was a very great need?—A very great need. You could not go anywhere to learn, and now you can go nearly all over the country and find an Institute.

2341. The British Dairy Institute was the first of its kind established?—I believe I am right in saying that the Institute founded at Aylesbury by the British Dairy Farmers was the first Institute that was founded. It was started, I think, in 1888—I am not quite sure if the travelling schools of the Bath and West slightly preceded that, or whether they did not, but they came into existence pretty much about the same time, I think.

2342. Was there a good supply of the first lot of students?—No, I cannot say that there was a good supply. I was speaking to our Secretary the other day about the first supply of students—he, of course, was Secretary of the Institute then—and he told me that Mr. Tisdale, the chairman of the British Dairy Farmers at the time, asked him to try and find students—if he knew any likely people he could persuade to come to the Institute, he was to try and get them. There was a good deal of prejudice amongst the farmers against the Dairy Institute to start with, and students did not come freely. I think during the eight years we were at Aylesbury the students would average from 40 to 50 in the course of the year. But that prejudice has died down. It has been killed simply because farmers have learnt to appreciate the teaching and to appreciate the people we turn out.

2343. Gradually the advantages are getting better known?—Yes, and I should say there is no prejudice whatever against Dairy Institutions now.

2344. Dairy Institutions are scattered all over the country now?—Well, that is rather a large statement, but they are practically scattered all over the country. There is one in the Midland counties, one in the North, one in Bangor and so on, and they are fairly equidistant from one another, situated to command a radius.

2345. You contrast the numbers in the first eight years of Aylesbury with the present number?—Yes, I contrast the number during the first eight years of Aylesbury, which was, I think, about 50, with the average of the students for the years that we have been at Reading, which, I think, is 100, or slightly over. You must remember that these figures must not be contrasted one against the other, because when we were at Aylesbury we were almost the only Institute of the kind, and now when you turn to the Reading figures you must remember there are half-a-dozen schools elsewhere to take students who might

otherwise go to Reading. So that you must contrast 50 against 100 plus the students that are going elsewhere, who might otherwise come to us.

2346. The Institution was transferred from Aylesbury to Reading?—Yes.

2347. Why did that happen?—We transferred to Reading largely with the idea of getting a better scientific education close to hand, and marrying ourselves to a scientific institution, so that we should be able to give better and more thorough scientific instruction, and at less cost, although I do not think that the less cost has been carried out.

2348. The expense of working was increased because of the extra cost of milk at Reading?—Yes. Of course, by moving to a centre like Reading we favoured the students on the main lines. From the point of view of the students it is an advantage for us to be at a centre like that, but from the point of view of a Dairy Institute where you have to buy your milk, you always have to buy it, of course, at a different figure in a place like that from what you would buy it at if you were situated right away out in the country. It is not quite a fair comparison in one way, because it is 10 years ago, but we now pay 2d. a gallon more for our milk than we did at Aylesbury, but if we moved back to Aylesbury, we should be able to get our milk at much less than we get it for at Reading, because the people who supply us with fresh milk at Reading have the option, if they like, of selling in the town. So that by moving to Reading we work at an increased expense for our milk, and we always make a loss on our milk in the winter, although in the summer we can make it pay. In the winter, however, we make a loss, and to such an extent that a loss is made on the whole year.

2349. You have, roughly speaking, three classes of students. Perhaps you will explain that?—I do not know that I can give you exactly the percentages. I generally catechise students as to where they come from, and what they hope to do—possibly Mr. Benson will be able to give you more definite figures, but I find a good many are either the sons or the daughters, or the wives, of small farmers, or possibly, some are on their own in a small way, who come at some little sacrifice—a considerable sacrifice, very often—to improve themselves, and they mean to go back to their farms, or to the work they have left to come to the college. There is a very large section of students of that description, and they are a class of students that ought to be catered for. They are a large section of the students who go through the Dairy Institute. Then there is a better class of students, who come with the object of qualifying themselves as dairy instructors, and taking up positions as teachers. Then one finds some who come really to gain knowledge sufficient for factory work, or to take up creamery posts, and so on. I should say that the first class is the main section of the students, and we look upon it as one of the most important sections, and the section we ought to push and study as much as possible. As an alternative method, you may divide them into two classes, as I have said further on, into students who come just to learn simply how to manipulate butter, or to manipulate cheese, in as short a time as possible, and who pick up their scientific knowledge in a haphazard sort of fashion in the short time that they give. That section, from what I am told, is rather changing, and we are getting a better class of students, who come with the idea of getting a scientific knowledge of milk and milk analysis.

2350. Those students come better prepared?—Yes, they come better prepared, and they are better students. Those who have come simply to learn how to manipulate butter and cheese I should call County Council students, who have come, perhaps, from a travelling butter or cheese dairy, and have come just to see what they can do in a little while. But we have rather fewer of those now than we used to have, and it is changing more into a class of students who really desire to go scientifically into the whole question of milk and butter and cheese. Then, of course, we have a very considerable number of students who come, say, for three months or for six months, and who mean to learn as much as they possibly can of the whole science of dairying, chemistry and bacteriology, as well as learning the practical manipulation of butter and cheese.

2351. Some of your students attend the courses at the College?—Some of them do. We have a certain percentage of students who are students of the College—of course,

always agricultural students. I think it is quite the exception for any student of the College but an agricultural one to come and attend classes in the Institute; but the Principal of the Institute informs me that he has often recommended people who wish to come to the Institute to go and take the agricultural course first at college, and then come into the Institute either from there or afterwards. Of course, as you will naturally see, it would work to their advantage to have an agricultural course preceding the Dairy Institute course. We cannot profess to teach agriculture in the Dairy Institute. The College also sends some of its agricultural students to the Dairy Institute; they are students of the College who come to the dairy. It is difficult to say what the percentage is, but I should say possibly 10 or 15 per cent. may be students of the College. I am speaking without exact figures, and I can only give you a rough idea.

2352. You have made arrangements with the College to facilitate that?—Yes.

2353. I suppose there is always an increasing demand for your students to obtain situations in creamery and factory works?—I should hardly say an increasing demand. You see the demand is limited for creamery and factory work, and I should hardly say there is an increasing demand.

2354. Creameries and factories are increasing throughout the country, are they not?—Yes, they are to a certain extent; but whether the demand for managers or for people qualified to take posts in them is on the increase, or whether we feel the demand, I should not like to say, but it may be so.

2355. With regard to the finances of the Institute, would you give the Committee some idea of the expenditure and sources of revenue?—Of course, on the credit side there are the fees paid by the students. Those fees are set at a figure to try and get as many students as we can, and they do not, of course, cover the expenses by any means, but we keep them as low as we can, and I think it would be better in a way if we could put them lower; it would bring us more students, and throw our education wider, but we cannot at the moment put them lower. Then there is a grant from the Board of Agriculture of £300. That does not cover the deficit, and the Reading College and the British Dairy Farmers' Association, being partners in the Institute now since we moved to Reading, have agreed to make up the deficit, and so at the end of the year, or during the year, both those bodies, the British Dairy Farmers' Association and the College, are drawn upon. I can hardly give you the figures exactly but we are drawn upon as a rule from £100 to £150 a year, each. That is what we have to pay. This last year, I think, from having paid only £100 for the year before, we shall have to pay about £150.

2356. Are your students resident students?—Yes.

2357. Have you a hostel for them?—No, there is no hostel for them. They reside in lodgings in the town.

2358. There is no difficulty with regard to that?—No.

2359. (*By Lord Moreton.*) They reside in Reading and in the surrounding villages, do they not?—There are villages round Reading.

2360. They reside not only in the town of Reading, but also in the villages round?—I do not know about the villages outside. I think most of the students live in the town of Reading; but there may be, of course, students who live outside.

2361. (*By Mr. Latham.*) I thought they had to live in lodgings under the care of the college?—I am not quite certain whether they are allowed to live outside the town if they can. The Principal now informs me that students under a certain age must live in Reading, but students over a certain age can go outside.

2362. (*By the Chairman.*) Where do students under a certain age reside?—They reside in Reading.

2363. (*By Mr. Latham.*) In a college hostel?—Yes. I am afraid I have not made that point quite clear—I was not quite clear about it myself—but I know that students under a certain age are under a certain amount of supervision by the college authorities.

2364. (*By the Chairman.*) Your students are drawn from a class who find it difficult to pay high fees, and low fees are a necessity?—That is the opinion I have formed from the class of man whom I have talked with when I have been examining there. I have come to that opinion, that they cannot afford to pay high fees, and they cannot afford to come for long. They come for as long as they can, and to them, in many cases, it is a considerable sacrifice to come at all.

2365. Does the county give you any contribution?—No, we have nothing from them. We used to have some scholarships, but we have not had any lately.

2366. How is the governing body of the Institute constituted?—The Institute is managed by a joint committee, appointed jointly by the members of the Dairy Farmers' Association and by the College. There are six members of each; six from the Dairy Farmers' Association and six from the College. We form a joint committee, and they manage the finances and everything connected with the appointments of the College.

2367. The Institution is inspected by inspectors from the Board of Agriculture?—Yes.

2368. You grant diplomas and certificates?—The diplomas and certificates that I allude to are the diplomas and certificates granted by the British Dairy Farmers' Association; they have granted those ever since they started the Dairy Institute at Aylesbury, and they continued to do so when they moved to Reading, and they continue their own examinations, which are, of course, held independently of the College. The College also hold dairy examinations, and, of course, students of the Dairy Institute go in for those examinations, but the diplomas and certificates to which I referred are those given by the British Dairy Farmers' Association.

2369. The diploma is higher than a certificate?—Yes. They give three classes of certificate. They give a diploma, which is the highest, in which they demand not only a fair knowledge of butter and cheese-making and the science of dairying, but also a fair knowledge of the science of agriculture. That is the highest. That involves a knowledge of agriculture. Then they give a teacher's certificate, in which they do not insist so much upon a knowledge of agriculture, but they insist that the person should be ready to give and capable of instructing—a person with an aptitude for giving instruction—both in the scientific and in the practical side of butter and cheese-making. That is the teacher's certificate; that is the second. Then they give butter-making certificates, or cheese-making certificates, which is the third. For a butter-making certificate, or a cheese-making certificate, the candidate must be able to make butter or cheese properly and well, and also be able to do a moderate scientific paper on the practice of dairying. They are asked a few questions on agriculture, but the principal questions are with regard to dairying, as to milking and butter and cheese-making, and so on; by no means a difficult scientific paper. They can take both butter and cheese-making. Of course, it includes a certain amount of practical work.

2370. How long is the course before you can take a diploma?—I do not think any student could properly take a diploma under about a year and a half. If he comes to the college with some practical work on the farm behind him, and then works hard for six months or a year, of course he might earn a diploma; but if he comes with no practical knowledge whatever, I very much doubt if he would take the diploma in a year, or even longer. I think he would fail for want of practical knowledge.

2371. How long would it take before he could get a certificate?—To take a certificate for butter and cheese a person ought to be able to do it, say, in three months or six months, that is if he has had a good school education, and if he is not a dolt in picking up the scientific education which he has to gather. If you send a man that can hardly read or write it is possible you would not get him to take a certificate under two years.

2372. How long does the teacher's certificate take?—The people who come to us for a teacher's certificate have, as a rule, gone through the butter and cheese-making certificates to start with. They have gone through their six months' course, and then they go on, or possibly they go away and work on a farm or get a minor engagement somewhere, and then they come back and work for a teacher's certificate. What they want is confidence in what they know, and they must have confidence in themselves, and that is not a thing that is acquired in a hurry.

2373. They have a better scientific knowledge, I suppose?—Yes, I do not say they are advanced scientific students, because they are not, but so far as they know it they know it properly.

2374. Do they get as much science as the diploma students?—Yes, I should say they do. As a general rule the teacher students know as much of the science of dairying as the diploma students.

2375. Is there a factory attached to the dairy?—No, there is no factory attached to it.

Mr. W. Ashcroft.

8 May, 1907.

Mr. W. Ashcroft.

8 May, 1907.

2376. And no farm?—There is a farm attached to the College.

2377. Not attached to the Dairy Institute?—No, not to the Institute. The college has had a farm within the last year or so, but before that they had no farm connected with the college, and all our milk had to be bought from a farm in the neighbourhood. Now a small quantity of our milk comes from the college farm, and we pay them for it on the same scale as our principal milk supply.

2378. You have all the appliances for making butter and cheese?—Yes, for butter-making and for the various classes of hard and soft cheeses, Cheddar or Stilton, or Cheshire or Wensleydale, and so on.

2379. Are there factories in the neighbourhood to which you can take your students?—No, I do not think there are any cheese-making factories in the immediate neighbourhood, and even if there were I do not think there is any necessity for a student to attend those because I think a student would do better to keep to his own cheese tub and his own churn, rather than running about to factories to look on.

2380. Your opinion is that the appliances you have for the purposes of instruction are superior to what you would be able to teach them with in a factory?—I will not say they are superior, but they are more diverse and equally as good, and they are to my mind quite sufficient.

2381. So that a student having gone through your course is quite at home when he gets into a factory?—Quite so. If a student comes to us for a certain course of cheese instruction, he is perfectly competent when he goes back to his farm, if he has applied himself while he has been with us to take up that work and go on with it.

2382. He would be competent to manage a factory would he?—That, of course, is rather a big question to answer, that would depend upon the student—rather more on the student than on his education, I think. But I think a student with fair brains could perfectly well qualify himself to take up managing work, that is, if he has got the gift of organising. A student may learn how to make cheese, but he may not be anything of an organiser or a manager when thrown on his own.

2383. (*By Lord Barnard.*) I do not think you have told the Chairman in what capacity you attend here. You come here as Chairman of the British Dairy Institute, I understand?—I happen to be at present Chairman of the Joint Committee.

2384. To whom does the Institute belong?—It belonged originally, when it was at Aylesbury, to the British Dairy Farmers' Association, but now it belongs to the British Dairy Farmers' Association and the Reading College, they are partners in it. I can hardly go into the exact particulars but that is practically how it is—they are partners in it.

2385. That is quite sufficient for my purposes. Is it a freehold property?—It belongs to the Reading College, who are, at present, arranging to sell it and build a new Institute near the present College buildings; but there is some dispute about the sale, and it is, at present, in abeyance. The Dairy Institute pays rent to the College.

2386. Is the constitution of the managing body in writing in any way?—Yes, there is a legal agreement between the British Dairy Farmers' Association and the Reading College in which all the terms are set out, including the terms of dissolution and everything of the kind. That has just been renewed for another year owing to this dispute about the sale of the present Institute. If the new Institute had been started we should have entered on a fresh agreement.

2387. You represent the British Dairy Farmers' Association on the committee?—I represent the British Dairy Farmers' Association on the Joint Committee.

2388. You are practically a dairy farmer yourself?—I am.

2389. You speak with a great deal of scientific experience and practical experience of dairy farming?—Yes, an experience extending over many years, but I put the practical experience first.

2390. I suppose the Principal will be able to tell us better as to the age which the students come to you?—Yes.

2391. I see the governing body includes representatives of the British Dairy Farmers' Association and of the Reading College. Does it include any of the teachers?—Only in this way, that ever since we have been at Reading the Principal of the College and the gentleman at the head of the agricultural department have always been members

of the Joint Committee, so that we have always had two teachers on the Joint Committee; and so we have now.

2392. Do they act as what is sometimes called advisory members, or are they full members with votes?—They are full members, they are elected members on the college side.

2393. You keep entirely separate accounts of your Dairy Institute, I suppose?—Yes, the secretary of the Institute is the secretary of the British Dairy Farmers' Association, but it is quite a separate account, and the accounts are submitted to the British Dairy Farmers' Association, and to the College for their separate contributions.

2394. Am I right when I say that the Institute was the creation of the British Dairy Farmers' Association?—Yes, I think you are perfectly right in saying that.

2395. Is the British Dairy Farmers' Association a modern institution or has it existed for some time?—It has existed, I think, since about 1882, but I am not quite sure.

2396. Is it an incorporated society or anything of that description?—Yes, I think it is.

2397. You have told the Chairman that you consider a great advance has been made in the promotion of technical knowledge in dairying?—Yes.

2398. Can you, speaking from your own knowledge, tell us whether the market price of dairy produce has increased of late years?—It varies so. If you ask me about cheese, I suppose cheese is better than it has been, but if you ask me about butter, if you want to compare the price of butter now with the price of butter 25 or 30 years ago, I should say that it is lower. I can give you a practical instance: when I began to make butter 30 years ago, I had no difficulty in getting from private consumers 1s. 8d. a pound, all the year round, but as time progressed I found plenty of competitors came along and the price had to go down, and I daresay now I should find lower prices still.

2399. Do you think the Institute has been of advantage to the dairy industry of the country generally?—Yes, I think so decidedly.

2400. From a national point of view?—Yes, because the country generally get their dairy produce of a much better and cheaper quality.

2401. Can you tell me whether the Board of Agriculture had any influence upon your removal from Aylesbury?—Yes, I think when we were at Aylesbury, we were told that unless we moved and married ourselves to a scientific institution our grant would be in jeopardy. I think that was one hint that was conveyed to us.

2402. You are quite satisfied with the control of the Board of Agriculture, and have found it helpful?—Oh yes.

2403. You have already told us, in answer to a question of the Chairman, about the students' fees?—Yes, they are on a sliding scale, you may say. The fees for a butter-making student are 10s. per week, for a cheese-making student £1 a week, that is if they only come for one or two or three weeks, but if they care to come for three months it is £10; if they care to come for six months they can come for £16, so that the longer they stop the cheaper they may come.

2404. In your accounts do you credit the college with the amount expended by the college for any instruction given to your students; and *vice versa*?—The British Dairy Farmers' Association pays to the College £100 a year for scientific instruction, that is what the Association itself pays the College. It is a little intricate, perhaps to understand, but they pay as part and parcel of the agreement.

2405. Do you think the operations of your Institute could, in the interests of the public, usefully be extended?—Yes, I think they could, most certainly. I think we should do better if we could have more laboratory work—at least a better supply of scientific work so as to be able to do more research work apart from what the College can supply, for that is rather full up, as you may say. I think on the one hand we ought to be able to do more in that way, and, of course, with more help behind us we could lower our fees and we could gather in more students. That, of course, is a supposition, but I think it would work so.

2406. Is there any other source except the Government to which you could look for increased revenue?—No; we have tried, and we have almost given up trying

to draw the County Councils. We used to get some scholarships, but I think we have given up even asking them now.

2407. I think you will agree with me in a statement I have made on more than one occasion—that no great financial support can be expected from agriculturists themselves?—No, I am afraid that is so.

2408. The agricultural industry in this country is not sufficiently flourishing?—No.

2409. Not like mining and other industries with which we are acquainted?—No.

2410. I think I interpret you rightly when I say that you are of opinion, from your personal knowledge and experience, that this Institute has been of great public service?—That I say without any hesitation whatever.

2411. (*By Lord Moreton.*) I believe on several occasions the examination for the National Diploma degree has been held at Reading?—Yes, of the Royal Agricultural Society.

2412. Have you ever been present at any of those examinations?—No, not personally. I have usually been examining myself when those have come on.

2413. Do many of your students go up for them?—Yes, when the examination of the Royal was in the autumn there was always a certain number of the students taking both—who went in for our diploma and teacher's certificate, and also for the diploma of the Royal Agricultural Society as well.

2414. Have you been satisfied with that examination?—Sometimes, yes; sometimes decidedly no.

2415. I do not mean as regards the percentage of pupils that pass, but whether you think it is a thoroughly practical examination?—You mean as regards the Royal Examination?

2416. Yes.—So far as I can judge, yes. We used to take a good deal of trouble to prepare for them, and we had to go to considerable expense—of course we were paid for it—to find extra plant for them, and we were quite satisfied as to how the examination was conducted.

2417. There is another question. I should like to ask you if you think it is a fair one. Do you consider pupils examined at the place where they have been taught have an advantage over pupils coming from a distance? I mean only as regards dairy work, of course. I do not know whether I have put it clearly enough. Let me put it in this way: should you consider that pupils at Reading had a slight advantage in an examination held at Reading, over a pupil coming from Derby to that examination?—You mean going in for the Royal examination?

2418. Yes, or any other dairy examination. I do not confine you to the Royal.—I do not think so. I have noticed students that have come under my observation, who have come from elsewhere, perhaps from Derby or from some other place, to Reading, to the examinations, and I do not think they are under any disadvantage. It very much depends upon the students themselves, although I must say, in answer to your question, that I have had the remark made to me that students going away from Reading to another college were under a disadvantage. That remark has been made to me, but I cannot say that it has struck me in examining pupils from elsewhere.

2419. You will not be surprised to hear that there is an opinion amongst certain people that a pupil has an advantage in being examined in the place of his tuition?—It has never struck me as being so in the various students I have examined, but I have had a remark, which will bear out yours, made to me, that students going from Reading to Derby went at a disadvantage. So that it comes to that in another way.

2420. (*By Mr. Lamont.*) I should like to ask you to repeat what you said as to the fees in answer to Lord Barnard, because I did not quite catch what you said?—The fees for a butter-making student are 10s. a week; for a cheese-making student, £1 a week, that is if they come for a short time; if they come for a three months' course, it is £10, and if they come for a six months' course, they can come for £16.

2421. Is that inclusive?—Yes, that is inclusive. Of course, the three months and the six months includes both butter and cheese, but the 10s. a week fee is only for butter-making, and the £1 a week fee is only for cheese.

2422. That is not, of course, inclusive of board and lodging?—No, those are the fees payable to the Dairy Institute.

2423. Could you give us any idea of what it costs a

student to live in Reading, taking lodgings and finding himself in food. I do not want to press you, but I think it would be of value if you ascertained that?—If I might appeal to the Principal I might be able to answer you definitely, but I should think that a student could find board and lodging in Reading for £1 a week.

2424. (*By Mr. Latham.*) I do not think it would be as much as that?—Perhaps not, but it seemed to me that it would be £1 a week, but possibly Mr. Benson can give you definite information about that.

2425. (*By Mr. Lamont.*) There is a farm attached to the Dairy Institute, is there not?—No, there is no farm attached to the Dairy Institute; there is a farm now attached to the College, which is under the control of the head of the agricultural department, which is intimately connected with the Institute.

2426. What is the acreage of that farm?—That I do not know, it is only a recent acquisition.

2427. (*By Lord Moreton.*) 200 acres is it not?—It is a small farm.

2428. (*By Mr. Lamont.*) How many cows do you keep?—I could not tell you, it has only just started, and I have never seen the farm myself.

(*Mr. Latham.*) It is not quite 20 cows.

2429. (*Mr. Lamont.*) Do you not think it would be of advantage if there were a creamery in connection with the Dairy Institute?—No, I cannot quite see the advantage myself from an educational point of view. A student comes to the Institute for a certain time, and if he is a conscientious student he has quite as much as he can get through if he wants to learn the proper manipulations of the different cheeses, and to learn what science he can get hold of in six months. I think his time would be quite as advantageously occupied in the Institute as by running about watching operations in creamery factories.

2430. Surely he loses what value there may be in seeing the work done by the use of pasteurisers or cream separators and other scientific instruments?—He learns the principle of the things, and I think when a man has learnt the principle of things, all about temperatures and so on, and what is to be done, once he is fairly grounded in the science I do not think there is any difficulty in applying that science.

2431. Do you not think that the greatest advance in the dairy industry of this country is to be looked for in the greater use, and the greater convenience and benefit to be had from the use of such instruments as I have mentioned?—No doubt pasteurising or sterilising milk is coming to the fore, and no doubt it will develop greatly.

2432. When I was in Denmark not very long ago, I went over the works of Burmeister & Wain, who are amongst the largest makers of scientific dairy instruments in the world, and they told me they were establishing a depot in Dublin because of the large demand that there was in Ireland for their instruments. I said "Are not you doing anything for England and Scotland," and they said, "No, we have a small branch in London for dealing with the Colonies and abroad, but that is all," and I asked then whether they were not proposing to establish a depot for England and Scotland, and they said there was not likely to be any demand in England and Scotland for scientific dairying, and that they were not afraid of British competition. Can you tell me what is the reason for that?—There is no demand for them in the country. It is coming in the large towns—you can hardly say it has come yet—and no doubt when it does come, we will try and develop it in the same way, and by teaching and providing demonstrations of what is needed.

2433. You think you must wait for the demand?—I do not think it is pushed upon us at present: it possibly will be.

2434. Then to come to the work that you are doing in the dairy; you are paying attention, I suppose, to the milk yield of your cows?—Yes, everything of that kind.

2435. A careful record is kept of that, I suppose?—Well, there are no cows to keep records of, but the advantages of keeping records and the need of keeping records, and so on, is, of course, taught, but if you have not got any cows you can hardly keep records of them, can you?

(*Mr. Latham.*) I should like to say that I think the records of the quality of the milk is kept better there, possibly, than any other place in England.

2436. (*By Mr. Middleton.*) You have an experience in general agriculture as well as dairying, I suppose?—Yes.

Mr. W. Ashcroft.
8 May, 1907.

Mr. W. Ashcroft.

8 May, 1907.

2437. You, I understand, are steward in charge of experiments for the Bath and West of England Society?—Yes.

2438. You move about a great deal in the South of England, and are in contact with farmers throughout the South of England?—Yes.

2439. So that you are able from personal observation to testify to the improvement that has taken place in the teaching of dairy subjects during the last 30 years?—Yes, certainly. I can say that, and I am also bound to say that there is room for still further teaching yet.

2440. I was just going to come to that. You have indicated the advance that has been made, and now I was going to ask you what further requirements are necessary?—Simply in matters of dairy education; there is still room for more advanced knowledge, going a step higher in all manufactures, both in manufactures of cheese and in manufactures of butter.

2441. Have you a sufficient supply of institutions now? Does the institute that you represent here sufficiently serve the South of England?—I should say, looking at the number of institutions there are dotted over the country, that if they are properly supported there is a sufficient supply. I do not know that it is fair to put Reading to me as a particular instance, but I should say there are quite enough, and that a multiplication of them would not be of advantage to the dairy industry. I think, however, that they should be better equipped even than they are.

2442. You prefer to strengthen existing institutions rather than to establish additional institutions?—That is what I mean, yes.

2443. (*By Mr. Latham.*) I feel a little diffident about questioning this witness, as he is one of my colleagues on the Bath and West of England. I did not understand what you meant by saying the cheese making now was in few hands?—I think you have misunderstood me. I said that 25 or 30 years ago it was extremely difficult to get any definite information on butter making, and that the cheese making then was only in a few hands. You might find here and there good cheese-makers, but they were only a few in number, and that you would hardly find any person who was competent to give you instruction in butter making at that time at all.

2444. I suppose when you started at Aylesbury it was in a very primitive way?—Yes, it was in a very primitive way. The surroundings were very small. We were the pioneers of it, and we only had one purse to draw upon; but still, although it was in a primitive way, we did at the time do extremely good work.

2445. Now you have made very great strides by coming to Reading?—Yes, and now we are better equipped. In the first place, we had all our experience at Aylesbury to guide us in building the present Institute, which was a very great factor; in fact, I think it is one of the greatest factors for success.

2446. With regard to the contribution from the County Council, indirectly, if not directly, I think the County Council of Berkshire helps you. It is in this way, is it not, that they would not give quite so much to the College if the college did not give something to you?—That is a question that I am afraid I am not competent to go into.

2447. I am a member of the Berkshire County Council and I can speak to that, and I do not want it to go out that we give nothing to the Institute?—Possibly, if you give more to the college on our account, that would be so, but I should prefer more direct assistance.

2448. You think you pay very dear for your milk at Reading?—No, I do not think we pay very dear where we are. I think we have very good terms for the milk, but what I mean is this, that you have certainly to pay more for the milk at a place like Reading, where the milk can be sold in the town if necessary, than you would have to pay in a place right away in the country where the farmer has no town in which to sell his milk, and if he wants to sell it he must put it on rail.

2449. Still you must be aware that the great majority of the milkmen all round Reading send their milk up to London?—Yes, quite so, and this man is situated quite near enough to retail it in Reading if he chose, but we have made an arrangement with him and of course we must have a supply from a farm close to; we could not do with rail milk.

2450. You made a remark about diminishing students; is not that to be accounted for entirely by the loss of the travelling dairy schools?—No, I should not like to say so—you mean the remark I made as to students from the

County Council schools who come for a short time and go away again?

2451. Yes?—You might establish a connection between that and the travelling dairy schools, but I do not think it is so.

2452. You have been asked about the cheese-making at Reading and cheese-making at home. Of course, the cheese-making at Reading is very much more varied than any home maker could possibly do?—Yes. If a man comes to Reading he can be instructed in whatever cheese he wants to make, and in all the different varieties—Cheddar, Cheshire, Stilton, Wensleydale, and so on—but if he goes to a farm he would probably only learn one method.

2453. Even if he only wanted to learn one method himself, it would give the student a good insight into the various varieties of cheese, and should make him a better man of business?—Yes.

2454. You rather surprised me when you said that butter did not sell at such good prices as it used to sell at years ago. I suppose I may take it that what you mean is owing to the large quantities of indifferent butter that it sold at a lower price?—Yes, I think you might put it in that way.

2455. If we had as good ways of making butter 25 years ago as we have got now we should certainly not have lost the industry as we have lost it at the present time?—Yes, there is a great deal to be said for that. The imports of butter, and of good butter, have increased tremendously in the last 25 or 30 years, and it is those imports that affect the price of the market.

2456. And our poor quality of butter made it worse?—Yes.

2457. Mr. Lamont asked you a little about cheese and butter factories. I should consider that in all probability our teaching was quite equal to that in factories, or possibly a little better. What is your opinion?—I should say so. I am a great advocate of the person being under a proper instructor or instructors, and learning to do the things themselves. I do not believe in looking on and just doing some little of the work yourself. I will give you an instance of that which was mentioned to me the other day. I was saying that ours was the first institute that was founded. "Oh!" said some one standing near me, "Lord Vernon established a factory at Sudbury before yours." I believe he did, but you could hardly class it as an institute. It was a factory. "Yes," said a man standing near me, "I went there myself, and all the time I was set to pulling milk up a hoist." If that is a sample of the work done at the factory, simply sticking to one thing, you are really better off at an institute where you are taught to do the whole thing yourself. I do not think you would be allowed to spoil butter, but you have the chance of experimenting at the Institute, and that is the most valuable thing of all, that you are able to do the work yourself.

2458. Are you satisfied with the Institute at Reading?—I think so. I am not always satisfied with the scientific knowledge of the students, but I think that applies to most institutes. I think you perhaps expect too much in the limited time a student has to give to the institute, and perhaps it is more a blot on the shortness of the time than on the teaching of the institute.

2459. With regard to the finance, everything is done that possibly can be done with the funds at your disposal, and if you had more money you would enlarge your work?—Yes, we could enlarge the laboratory, and we could have a more scientific equipment for research work, which is necessary, and which we ought to have in order to keep on advancing. That is one reason why I should strongly advocate more encouragement and more help, and on the other hand I think that with more encouragement we should be able possibly to lower our fees for the very students who most need them lowered. Those are the two reasons why I should advocate assistance being given us, and both of them are very strong reasons, I think. We really do want to have a more scientific and better laboratory accommodation in every way, and more bacteriological work, and everything of that kind pushed forward. Of course there are the college laboratories, but they are generally pretty full, and I am assured by the Principal that more could be done in that way if we had more room of our own.

2460. I think I know what your answer will be to this question—you are perfectly satisfied with the produce that you are able to turn out?—Yes, quite.

2461. (*By Mr. Davies.*) You have told the Committee

that the cost of the milk was a great deal more in Reading than you previously paid at Aylesbury?—Yes.

2462. I suppose there are other compensating advantages which you get from being near the University College?—Yes, we of course get the advantages of scientific training quite close through being married to the College, whereas when we were at Aylesbury we had to find our own.

2463. Do you look upon yourselves as the agricultural department of the University College at Reading?—No, we look upon ourselves as the dairying department of the University College. The College gives instruction in dairying apart from the instruction which we give in the Dairy Institute. They give their own dairying instruction as well as us, and there are examinations in dairy instruction at the College quite apart from the dairy instruction that is given in the Dairy Institute.

2464. Do you not occupy laboratories and so on that belong to the College?—Yes, we do to a certain extent, and the room is rather crowded, I think. We should like to have more room and be able to give our students more room. The Principal informs me that it is a pity that we have not got more laboratory accommodation. We work in the College laboratories you see; we have a small laboratory of our own, but it is a very small one compared with what it ought to be.

2465. Is there a certain amount of over-lapping between your department and that of the College?—No, not over-lapping, I would rather put it overcrowding; I think we strain the laboratories of the College.

2466. Is it not the fact that the College gets a pretty big grant from the Treasury?—Yes, I do not quite know what the amount of it is, but we get a portion of it; £300 of it is allocated to us.

2467. I think you told us that your students were practically divided into three classes?—Yes.

2468. Do you make any differentiation in the charge?—No, that is only a rough division as regards the percentage division. What I call class I is the largest section. We make no difference in the fees for any class of student either rich or poor.

2469. Do you not think it would be desirable to make a distinction between those students who are going to become factory managers and the others?—That is very pretty in theory, but it would be very difficult to work, I am afraid.

2470. You do not think you could make a reduction in the fees for those who were the sons of small farmers?—If you did that you would have to be always defining what was a small farmer, and you would have to say when he was competent to pay, and when he was not competent to pay, and I should not like to be the inquisitor.

2471. Some witnesses have told us that that is being done and that it is possible. You have not any travelling dairy schools now?—No, not now.

2472. They have all been given up?—Yes, they have all been given up. We worked one in the counties, and we worked one when we were at Aylesbury, but there is nothing of that kind in Reading, in fact all the travelling schools have been given up practically since we have been there. I should say to a certain extent that the colleges have taken their place.

2473. Did they not serve to bring students to the College?—Yes, certainly.

2474. There is only one other thing I want to ask you. Mr. Lamont told us about his experience in Denmark. I was not quite sure what your opinion was with regard to that as to whether more attention ought to be paid to scientific apparatus and so on, or otherwise?—You mean with regard to sterilising and pasteurising milk?

2475. Yes?—I think if the demand progresses for sterilised or pasteurised milk in England, attention will have to be paid to it, but I do not think there is a very great demand for that at the present time. There is a modest demand in large towns, but hardly any demand elsewhere, I should say. I do not mean to say it will not grow, but it has not come yet.

2476. Is it not the duty of your Institute to provide for that and show these people how to do it?—Yes, but it is a very vexed question.

2477. Do you carry on any experiments in your Institute?—No, except in a very modest way—you mean in the way of cheese-making?

2478. Yes, you have cows now, have you not?—No, we have no cows; the cows belong to the College.

2479. Do they allow you to carry on experiments with them?—They carry on the experiments with them themselves—openly, of course.

2480. Do you not wish to get in closer touch with the College?—No, we are on a very friendly arrangement with the College. You see the farm itself has only been started in the last year or two by the College; it is quite a new addition.

2481. (*By Mr. Lamont.*) I should like to ask you one or two other questions on the same point. You have told us that you have no farm, and therefore, of course, you have no cows. You have accordingly no training in milking, I take it?—No; there is no practical training in milking.

2482. No experiments are going on as to the results of feeding on the quantity or the richness of milk?—Nothing beyond the experiments that have now been started by the College with their cows. They are now carrying on what you may call experiments to demonstrate the result of feeding on yield of milk and so on—I do not say they are advanced experiments, but they direct the attention of the students to what they ought to know.

2483. Do you direct the attention of your students to the experiments that are carried on at the College?—Yes: for instance the college milk comes in to us and they are shown the percentages there are in the college milk as compared with the milk that we get from elsewhere, and, of course, the head of the agricultural department who lectures in the Dairy Institute would draw the attention of the students to what experiments were going on in the College, or to any experiment that he himself was conducting. The connection between the two is very intimate; the head of the agricultural department of the College comes in and lectures to the students in the institute several times a week.

2484. There is another very important point I want to put to you. You know that in Denmark, and in the United States, and possibly also in many places in this country, a new method of milking has been introduced within these last few years by a kind of massage of the udder, whereby a further 5 per cent. of the ordinary yield is obtained probably, and I dare say you know that that last milk is much richer in the way of butter fat than the milk that has been got before. Have you any means on the farm of directing the attention of the students to that?—The principal informs me that since the College farm has started, the students have the advantage of going there to learn milking.

2485. They will, therefore, have that advantage, otherwise it would seem to me that if you have no cows, and no factory, your work would be scarcely complete?—You must remember that so many of our students come to us from farms that I almost invariably ask the students, who come before me for examination, where they have come from, and whether they have learnt to milk, and I should say 60 or 70 per cent. of them tell me they know how to milk, and have been in the habit of milking.

2486. You obtain the great preponderance of your milk from outside, from other farms?—It all comes either from the neighbouring farm or from the college farm.

2487. Do you have any system of inspection of the cows in the farm from which the milk comes?—We always have a system of analysing the milk, as to what it consists of.

2488. But not in the direction of examining the cows themselves, as to how they are kept, and as to their general healthiness?—No, but I think we are satisfied of that. Two members of the committee visit both farms very often, and if they had any complaint to make they would lay it before the committee.

2489. Of course no one dreams of sterilising milk now, but a great quantity of milk is pasteurised, and as you know it is sold in two qualities, one quality for feeding children at a higher price than the other, and a much more careful system of supervision goes on in the places from which that milk comes. That is what I wanted to get at, whether anything was being done on those lines?—No, very little is being done at present in the College on those lines.

2490. May I ask you, as a last question, whether you do not think your work would be more complete if it did begin at the beginning, and if you had your own dairy, your own farm, your own cows, and your own factory?—I quite admit that. If you have your own dairy and your own cows, it would be a great advantage, but if you have not got those conveniences, you must do without.

Mr. W. Ashcroft.

8 May, 1907.

Mr. MILES BENSON, called and examined.

Mr.
M. Benson.
8 May, 1907.

2491. (*By the Chairman.*) You are the Manager and Chief Instructor of the British Dairy Institute at Reading ?—Yes.

2492. The instruction given at the Institute is both practical and theoretical ?—That is so.

2493. And is arranged with a view to meet the requirements of those who need either elementary or advanced dairy instruction ?—Yes.

2494. Or who wish to specialise in the manufacture of any particular variety of dairy produce ?—That is so.

2495. Perhaps you will now give the Committee a few of the special facilities which are provided for those who wish to study dairy chemistry, milk analysis, or bacteriology ?—With regard to the dairy chemistry, we have recently entered into an arrangement with the University College, who are practically adjoining us, to give a course of dairy chemistry extending over a period of six hours per week. That has been arranged since the beginning of the college term. With regard to bacteriology, I may say that the lecturer of the agricultural department of the University College is giving weekly lectures on general bacteriology. In addition to those lectures we have a scientific lecturer from the College whose regular work it is to lecture at the Institute during the college terms, so that we not only get bacteriology and chemistry in the College, but we get college lecturers on those two subjects in the Institute. That has been very much appreciated, because in previous years we did not get the amount of dairy chemistry and bacteriology which was necessary, principally because we had no such arrangement made for instruction in those subjects.

2496. Will you tell us what you do in the way of research work ?—I am afraid there is not a great deal of that work done. Of course research work would take up a good deal of time. The Institute is open all through the year, with the exception of a short vacation at Christmas, and during the year we have a large number of students—the average is 100—and the time that the institute staff has at its disposal would not allow of much research work. Of course we should like to see it done. We have only a certain claim upon the College for research work, and we should like to be in a position to ask the College to assist us still further in that respect. At present the College is giving us all that we are entitled to in the way of instruction.

2497. Do you think it is more the duty of the College than of such an Institute as yours to carry out research work ?—We have not the staff to carry out research work, but we should like assistance from the College in conducting research work at the Institute.

2498. The students may join at any time ?—Yes.

2499. And for any period ?—Yes.

2500. Is there any entrance examination, is any test applied to the students who come to you ?—No, there is no entrance test of any kind.

2501. Are any scholarships held ?—There are very few. We shall have scholarship students from Glamorganshire and the County of Dorset, but those are about the only two counties who send scholarship students to us.

2502. Your summer course of six months begins in April, and ends in September ?—Yes.

2503. For what instruction does that course provide ?—That is the course that we would recommend to a student who proposes to come to us to take the certificates referred to by Mr. Ashcroft. That is the course that would be recommended to a student who comes to us in order to qualify for a butter and cheese-making certificate.

2504. The winter course commences in October and extends to March ?—Yes.

2505. Who are the students who attend the summer course, and who are the students who attend the winter course ?—In the winter course we get a good number of students who come to learn butter-making and soft cheese-making, and a number who come to learn chemistry and milk analysis, milk testing and dairy bacteriology.

2506. Do both the students who attend the winter course and the summer course attend scientific courses ?—Yes, they get scientific instruction during that time.

2507. Students who wish to take the higher diplomas in dairy farming and dairying you recommend to take a preparatory course of agriculture at the Reading University College ?—That is so.

2508. In addition to the summer course at the Institute ?—Yes. In those examinations where diplomas are awarded a considerable amount of agriculture is necessary, and for many years past a great number of students have entered for this diploma examination who certainly have not had the necessary training in the science of agriculture. Of recent years, upon that account, we have recommended students who intend to learn dairying thoroughly to take a college course. It may be a sessional course or a two-term course, dependent on the knowledge they possess when they come. That course would be taken previous to a six months' course in the Institute, where they would gain their knowledge on practical dairy matters.

2509. Do any of the students who attend the winter course go through this preparatory training at the University College ?—Very few.

2510. You consider that for that class of student it is less necessary ?—Yes.

2511. The main object to those students is practical training ?—Yes. Of course during the winter we have all the College agricultural students once weekly, and in some cases twice weekly.

2512. Then you have students who attend for periods exceeding one month ?—Yes.

2513. A month is the minimum, is it ?—Many come for less than a month. Sometimes we have a student who comes for a fortnight, or even less than that.

2514. They take instruction in cheese-making and the general routine of dairy work ?—Yes.

2515. That is entirely practical ?—Yes.

2516. They do not get any certificate ?—No, we award them no certificate at all.

2517. During recent years you have found that there is an increased demand, as compared with former years, for instruction in scientific work ?—Yes, I think that is largely on account of the appointments that are being made by dairy factories and milk retailers. Those appointments afford openings for men who can test milk or any other dairy product, and in addition to that there is a general desire to study dairy bacteriology and chemistry.

2518. That is a result, you say, of the appointments which are made for the management of dairy factories, and of the farm inspectors who are appointed by the dairy companies ?—Yes.

2519. Dairy companies have taken to appoint farm inspectors ?—Yes, the people who deal in milk are beginning to realise that they must systematically test and analyse milk and get to know what they are selling.

2520. Therefore the result of the increase of dairy factories has undoubtedly acted beneficially in recruiting students for your college ?—Yes, but I should not say entirely. Many of the firms who are selling large quantities of milk and other produce have appointed men to do nothing else but test and analyse the produce which goes from their premises, and certainly there are many good appointments in factories for men who know how to analyse and test milk, butter, cheese, &c.

2521. What is your view about the questions which were asked Mr. Ashcroft with regard to the desirability of having a dairy factory attached to the Institute ?—I may tell you that in my student days I went to a factory to learn dairying. I went to a factory for six months, and during that time I learnt nothing of any value to me. I was never allowed to touch anything. I was never given even an opportunity of making up a pound of butter. The result was that I was unemployed for most of my time, and, as Mr. Ashcroft mentioned, I did a great deal of the hoisting up of the milk in the lift. I do not think a factory is the right place for a student to earn dairy work ; he would be inclined to get into careless methods without a careful preliminary training on a more primitive scale, and in addition to that he would be running too great a risk of spoiling produce.

2522. You think he should have the other training first ?—I think so.

2523. You will admit, of course, that the factory that you are referring to is an instance of how the thing ought not to be done, but if there was a dairy factory where instruction was properly given, then you would not deny, would you, the importance of it ? Take the subject of book-keeping, for instance ; that is a very important subject ?

—Yes, but of course my point is that in my student days I did not know where to find a factory where such instruction was given, and I think that the same difficulty exists now.

2524. You are speaking of your personal experience in former days?—Yes.

2525. Do you admit that the extension of dairy factories would be beneficial? Take the case of Denmark, where they are everywhere, and where I believe instruction is given?—Yes.

2526. Obviously that includes some knowledge, for instance, of machinery; you would require some engineering knowledge?—Yes, of course a man who is going to enter into a milk concern where a lot of milk is handled must learn somewhere how to manipulate a large quantity of milk, and how to manage the machinery which deals with a large quantity of milk, and the factory is the only place where he would get that knowledge.

2527. Quite so; therefore you would admit that with proper organisation, and as a sequel to the individual instruction given at your college, such instruction would be useful?—Certainly.

2528. Among the students at present at Reading you have one who is studying in the interests of one of the largest factories connected with milk in this country?—Yes, that is the Anglo-Swiss condensing factory.

2529. Two students have recently passed through the school who were connected with one of the largest dairying concerns in the West of England?—Yes, I refer to the Wilts United Dairies, a large establishment in Wiltshire.

2530. Will you give us a list of the localities and counties from which students come?—I have a statement here which supplies that information.

(The Witness put in the following table):—

COUNTIES AND COUNTRIES FROM WHICH STUDENTS HAVE BEEN DRAWN, FROM JULY 6TH, 1896, TO MARCH 31ST, 1907.

Northumberland	1	Oxfordshire	38
Cumberland	9	Hertfordshire	22
Westmorland	1	Somerset	48
Durham	9	Devon	13
Yorkshire	12	Cornwall	16
Lancashire	29	Dorset	95
Lincolnshire	2	Wiltshire	27
Cambridge	1	Hampshire	60
Norfolk	7	Middlesex	6
Suffolk	13	Surrey	27

Holland	3		

Summary.

English Counties	879
Wales	81
Scotland	31
Ireland	33
Jersey and Isle of Wight	8
Colonies	16
Foreign Countries	35

Total Students 1,083

2531. They come from all parts of the United Kingdom, and there are 35 from foreign countries also?—Yes.

2532. You can also give us an analysis of the Students' Register showing the length of course?—Yes, from the date of transference to Reading.

(The Witness put in the following table):—

ANALYSIS OF STUDENTS' REGISTER, JULY 6TH, 1896, TO MARCH 31ST, 1907.

Year Ending Mar. 31st.	Total Students.	Men Students.	Women Students.	LENGTH OF COURSE.							*
				Less than 4 weeks.	4 to 6 weeks.	6 to 8 weeks.	8 to 12 weeks.	3 months.	6 months. and over.		
July 1896-7	82	37	45	41	21	8	6	6	—	—	
1897-8	133	48	85	49	60	8	6	10	—	—

	1083	438	645								

* University College Sessional Students attending the Institute once weekly.

2532A. You say you have had great difficulty in keeping in touch with students after they leave you?—Yes, that is a difficult matter.

2533. You have therefore been able to give us only an approximate account of their doings?—Yes.

(The Witness handed in the following statement):—

10	per cent. take up dairying in the Colonies.
18-20	„ return to their dairying pursuits at home.
5-6	„ go as Dairymen.
12	„ Dairymaids.
6	„ Dairy Teachers.
10	„ Take up dairy-farming.
25	„ Farming.
4	„ Agricultural Lecturers.
5	„ Farm Bailiffs.
5-10	„ Inspectors, Analysts.

A large number of Reading students hold appointments as dairymaids in private dairies and estate dairies, and in several instances these dairymaids have established a reputation at important agricultural shows for their butter.

2534. Among the teachers of dairy work there are very few whose names do not appear on your Institute register?—I think that is so.

2535. At the present time three of your old students are employed as Government Dairy experts in Australia and Natal?—Yes.

2536. You have also given us the results of the public examinations of your students?—Yes. I think you will find in this statement, information given on a point that was put to Mr. Ashcroft referring to the number of diplomas awarded to the Reading students. You will see that 39 per cent. of the total number of National Diplomas awarded at the English centre were gained by Reading students.

2537. That is by students of the College?—Yes, joint students of the College and the Institute.

2538. You also give the results of the British Dairy Farmers' Association's examinations?—Yes; those are held twice yearly.

(The Witness handed in the following tables):—

DIPLOMAS AND CERTIFICATES GAINED IN PUBLIC EXAMINATIONS BY READING STUDENTS JULY, 1896, TO MARCH 31ST, 1907

National Dairying Diploma (English Centre).

Year.	Diplomas Gained.
1896	5
1897	4
1898	4
1899	5
1900	1
1901	4
1902	5
1903	3
1904	9
1905	3
1906	4

Total 47

Total number of Diplomas awarded at English Centre, 120.
39 per cent. gained by Reading students.

Mr.
M. Benson.
8 May, 1907.

BRITISH DAIRY FARMERS' ASSOCIATION'S EXAMINATIONS,
JULY, 1896, TO MARCH 31ST, 1907.
(Examinations at the Reading centre.)

Year.	Diplomas.	Teachers' Certificates.	Cheese-making Certificates.	Butter-making Certificates.

In Dairy business ...	5
Total ...	102

2540. During the past ten years the institute has sent up annually to the London Dairy Show a large educational exhibit of dairy produce?—Yes.

2541. Approaching in weight $1\frac{1}{2}$ tons of produce?—Yes.

2542. In conjunction with that annual exhibit the College has contributed a scientific display?—That is so.

2543. That combined educational exhibit demands some months of preparation?—Yes. We commence to make the produce referred to in July. It has to be made with great care. The making of it is entrusted to students—those who wish to join the cheese-making classes at that time of the year are advised to do so when we commence to make the show produce. The exhibit not only provides useful instruction to the visitors at the show, but also to the students who are in training at the time when the produce is made.

2544. The number of enquiries that you have received during the year from the people who require either dairy-maids, dairymen, or teachers, has been 34?—Yes.

2545. During the year you have had also ten enquiries from past students requiring posts?—Yes.

2546. And 50 enquiries from the public other than past students for advice on dairy matters?—Yes; those enquiries are from people who have trouble at home in their own dairies with their butter or their cheese; they send samples to us probably of faulty butter, or cheese, and invite our criticism and advice thereon.

2547. Are samples occasionally sent to you for analysis with regard to imported butter and imported cheese?—No.

2548. What further development do you think should be given to the work of the institution?—I think that there is a great lack of knowledge in dairy bacteriology; we want

to be able to identify and classify the bacteria in milk. The books that we read on bacteriology describe some particular microbe that has been found in milk, and a name is given to that microbe. Then another investigator writes upon a microbe that he has discovered, and he gives it a name. We do not know but what this same organism is identical—whether it is the same thing grown under a different condition. We want some reliable information on dairy bacteriology. That is work that will take a lot of time, and it will mean considerable expense in equipment. That is the kind of work we should like to do at Reading. It is quite easy to isolate the microbes in milk, but it is another thing altogether to be able to isolate and to be able to identify them, and our difficulty is that we have nothing to refer to to help us in identifying these organisms which are constantly giving trouble in cheese-making.

2549. You mean that that is still an unexplored field of research?—Yes; particularly the organisms in milk which we have to deal with in cheese-making; then we would like to conduct an exhaustive experiment on the ripening of Stilton cheeses. We would like to know how to be able to turn a cheese blue at will, and there are many other experiments that would be useful connected with the ripening of such cheese, but which of course would take a considerable time to carry out.

2550. You think that the Board of Agriculture ought to give encouragement to such experiments?—I think so; I should be very glad if it would.

2551. (By Lord Barnard.) To follow up one of the questions which the Chairman has just put to you, have you any suggestions yourself as to how this knowledge could in the first place be obtained and in the second place diffused?—I think some years ago the Board of Agriculture conducted some most useful experiments in Somersetshire connected with Cheddar cheese making, under the direction of Professor Lloyd. Copies of the record of those experiments were published, and they were bought very eagerly by dairy students, who have made good use of them. From our point of view we should like to have seen those experiments carried on further.

2552. Do you think that if under the influence and guidance of the Board of Agriculture some central association of all the institutions engaged in dairy instruction were to be connected that it would be an advantage instead of each of them, as it appears to me at the present day is the case, working almost independently of its neighbour?—I think some such arrangement would be an advantage.

2553. One of the previous witnesses was asked whether he did not consider it would be of advantage for the purpose of following up the careers of students and also enabling them to continue the advancement of their own knowledge that associations or clubs of students should be formed?—I may say with regard to the institute students that a students' club has quite recently been started with a membership of over 100 already. I think that the students' club has been in being now for about a month. The secretary is the son of a Cheshire dairy farmer, who is secretary of the Cheshire Dairy Farmers' Association.

2554. That practically answers the question that you have, although only recently, realised the advantages of such an institution?—Yes.

2555. Now, to go to quite another branch of the subject, would you give the Committee very briefly an outline of your own career?—Do you mean what I have done?

2556. Were you in early life connected with farming?—My father was a yeoman farmer in the Pennine district of Cumberland.

2557. What led you to take up this particular form of farming—you talked about your student days just now?—I followed the example of a senior brother—

2558. Please do not go into very great detail because we have not a great deal of time left to us?—I may say that in 1886 I had a brother who was interested in dairying. There was no dairy school to go to, and he naturally went to some gentleman interested in dairy farming who could give him instruction. He went to Professor Long, who was then living in Hertfordshire, and he took instruction there for two years, and after his course there, was appointed manager of the British Dairy Institute at Aylesbury. He acted in that capacity until within two years of its transference to Reading. I was a student at Aylesbury in the first year that it started; I think I was there very nearly two years in all. There was then a great demand for instruction, and I spent several years going about from one private dairy to another giving private instruction. In the meantime I spent some months in

the various factories in this country, and I have been employed as a manager of a factory. I also took the opportunity of going round the various dairying districts, especially the cheese-making districts of Wensleydale, Cheshire and Leicestershire.

2559. How long have you been in your present position?—When my brother left Aylesbury he went to take charge of the Midland Dairy Institute, and I succeeded him at Aylesbury. I was in charge of the institute at Aylesbury in 1895 and 1896, and I went to Reading when the Institute was transferred, and I have been in charge for over 12 years.

2560. From what you have told us you have had considerable experience both in practical business and in teaching?—Yes.

2561. I daresay you are prepared to state that as the result of that experience you consider that the practical work alone is not a sufficient training?—No, it is not; certainly not.

2562. On the other hand you would not contend, I daresay, that theory alone is sufficient without practice?—I should not think so; I think the right way to train is to take the practical work first and the theoretical work afterwards. I must say that at one time I was rather prejudiced against theory, but now that I have to know more about theory, I prefer the theoretical work to the practical.

2563. Are your past students enthusiastic; do they admit the advantages which they have obtained?—Yes, I think so. Dairy students are very earnest sort of people who want to get all the information they can—at least that is so in our case.

2564. What ages are your students as a rule?—I should say the youngest students that we have would be 18 years, and the eldest may be—we had two students who left us recently whose ages were, I think, 60, but I should think that if we took the average age it would be 25 or 26.

2565. How many of them live in hostels?—All the girl students under 21 reside in college hostels. A very large men's hostel is being built in Reading for the college. That has been given by Lady Wantage, and when that hostel is built all the men students will reside in a college hostel too.

2566. You are going to abandon the lodgings system then, I suppose?—Yes, it is not popular; the students find it more comfortable in the hostels, and I think when the men's hostel is built it will be one of the finest hostels of its kind in this country.

2567. Can you tell us what it costs for lodgings in Reading?—To get comfortable lodgings it would cost from £1 a week to one guinea.

2568. What would it cost them in the hostel?—Practically the same.

2569. Are the regulations of the courses of study and so on entirely in your hands, or are they controlled by your committee in any way?—The courses of study?

2570. The courses of instruction?—As far as the practical instruction is concerned that is in my hands. We look to the College for the theoretical work. Of course, I do a good deal of theoretical teaching, but a great part of the theoretical work is directed by the College.

2571. Are there any failures for the diploma and certificate examinations?—There are failures and we have some students who are bound to fail. We, of course, have capable students and incapable ones, and it is very difficult to make a capable student out of an incapable one. The difficulty we have is this; that so many come to us who have forgotten their arithmetic, and we have to teach a great number of them the elements of arithmetic. That applies to nearly all these people who come from the country districts.

2572. It seems to me, as far as I can judge, from the evidence you have given to the Chairman, that the course pursued by the students is a little haphazard. It seems to me that the students can come for quite a short up to quite a long period?—That has always been so with a view to accommodating people in dairying districts who cannot come just when they like. We get a large number of students from the cheese-making districts who cannot come at a definite time; they prefer to come perhaps between hay time and harvest, or between turnip hoeing and hay time, and it is to accommodate those people that we keep the Institute open for them, to join when they like.

2573. I should like to know whether it is your opinion that your Institute should be left to make all its own regulations on questions of that kind, or whether there should be some central system of organisation, I will not

say controlled by, but under the supervision of the Board of Agriculture?—The difficulty I think would be that there are, of course, always local conditions to consider, and I think they would probably present a difficulty there.

2574. At present you are entirely unfettered by any central regulations?—That is so.

2575. Would it be practicable by the co-operation of all the institutions in the country and other experts on the subject to have more of a standardisation of butter than there is now?—Do you mean as regards quality?

2576. Quality and so on. I believe it is done in Denmark, is it not?—I do not know.

2577. So that the judges at local shows would be able to judge more critically the different exhibits?—In a large agricultural show, for instance, where there is a big entry of butter, it would be very difficult to judge all those butters on points because it would take up such an enormous time. I have judged at many shows where there have been large entries, and have tried to judge on points, and have found that it has taken up practically half the day, and even then I have not finished the work thoroughly. I think the fault lies in the fact that there are not enough judges to do the work at these shows. The judging of butter at shows would no doubt give more satisfaction if all judges made their awards according to flavour, texture, colour, appearance, and moisture present. Some judges do not recognise all of these merits, all of which contribute to the good properties of butter.

2578. I was referring more particularly to small shows where I think the result is far more doubtful than in the case of large shows. I am not an authority on butter myself, but I always very much doubt whether the prizes are correctly awarded?—I think there is a good deal of bad judging at some of these small shows. It is because all the properties of good butter are not taken into account.

2579. Do Government departments ever consult you at all—the War Office or any department of that kind?—I think not. We have enquiries from Government instructors in Australia very frequently, and we have applications from the Intelligence Division of the Board of Agriculture asking us to look over a pamphlet which is intended for circulation; to revise if necessary any little fault.

2580. The chairman of your committee stated it just now and I think you will support it, that you and other institutions similar in character are desirous of having further financial assistance from the Government?—I think so.

2581. You are desirous that you should have that assistance?—Yes.

2582. Are you in favour of the Board of Agriculture going to the Treasury and to the House of Commons for such a grant, and being able at the same time to say they are prepared to impose further regulations and conditions, or should they ask it without any conditions or regulations at all? Do you think any steps should be taken to say that any increased grant should be accompanied by any increased work, or any increased efficiency?—I think, so far as my experience goes, we have worked very hard for the amount that has been contributed towards us compared with what is done by Government assistance for colleges like those in America. For instance, some of the best bulletins that I read on modern experiments come from America. They are sent to me practically free of cost. I have only to intimate that I would like them and they are sent to me absolutely free year after year. An enormous amount of most useful experimental work is done in these colleges which I should imagine could not be done without financial assistance from the Government. We would like such experimental work conducted at Reading, but our staff is limited and there is very little time for work other than teaching.

2583. Then it amounts to this really, that you consider that the central authority, the Government of this country, has really got some leeway to make up first—that it has to catch the institutions up rather than that they should catch the Government up, that practically the Government is behind?—I think so; I think the headway the American colleges have made in conducting experiments has been due largely to the substantial help that they have had from their Government.

2584. (By Mr. Middleton.) You referred to our lack of knowledge on subjects connected with dairy bacteriology. I do not quite gather what you mean by that phrase. Is your difficulty at Reading that you have not got a bacteriologist who is able to recognise the organisms which you find in your produce, milk, etc.?—I think it would be very difficult to find a man who could recognise bacteria when he saw them.

Mr.
M. Benson.
8 May, 1907

Mr.
M. Benson.
8 May, 1907.

2585. But there are other methods?—Yes.

2586. My point is this: do you fail because you have not got the man who could conduct the work, or because you think you are dealing with a number of organisms which have not been described and which require description?—Yes, that is what I mean.

2587. You were referring just now to the bulletins which are issued in the United States?—Yes.

2588. You probably know, therefore, the work that Wisconsin has done, and also that in New York State station?—Yes.

2589. You think the work which they have done in connection with the ripening of cheddar cheese need not necessarily apply to cheddar cheese ripening in Reading and that there ought to be fresh investigations. Is that the point?—No, I merely wanted to point out that we learn more of experimental work through American bulletins than we do through English ones, because in America they experiment more and go more into the subjects which particularly interest us. Personally I should like to see a grant made to one or more agricultural colleges or dairy institutes for the sole purpose of investigating the bacteria which affect cheese-making.

2590. The work which has been done in that direction in foreign countries does not meet your case?—More requires to be done.

2591. Of course, you yourself are not concerned in the teaching of bacteriology?—I have been making a study of it for some three or four years, but I am not supposed to be a teacher of bacteriology. The bacteriology instruction is provided by the College, I assist in the teaching of that subject.

2592. From your own knowledge do you say you have come across what one may call new organisms?—Yes, organisms which it is impossible to identify by the reference which is available.

2593. It is in that direction that you want further help?—Yes.

2594. The value of the factory was referred to by one or two members of the committee. Have you not at the Institute all the types of machinery that would be found in a factory?—We do not profess to train a student in factory work, because ours is not a factory district. I have pointed out already to our committee that it is necessary that we should give instruction in the use of power-driven machinery. In the plans of the new building provision has been made for produce to be made on factory lines, that is with motive power. We do not ignore that necessity.

2595. So that when you are fully equipped you will be able to do all that a factory could do, except give them business experience?—Yes.

2596. Which, of course, could only come by actual practical work?—Yes.

2597. (*By the Chairman.*) In your teaching is there any knowledge imparted of cattle-breeding?—We have lectures. Students who take the six months' course, which extends from April to September, will have a definite number of lectures on cattle management—the management of cows. They are taken over farms usually once a week, and if it is not a farm that is visited they are taken to some demonstration or other which will afford them useful instruction either in dairy work or dairy farming. We arrange demonstrations, and we occasionally visit a London dairy. Only last year we visited one of the largest milk establishments in London. Lectures on the management of cattle are given at definite periods by the college lecturer.

2598. Also on the feeding of cattle?—Yes.

2599. And of the influence of the feeding of the cattle on the milk?—Yes, that is included.

2600. And on the results the milking processes give?—Yes, that is included in the syllabus of examination which our students are working for.

2601. Is that the examination of the British Dairy Farmers' Association?—Yes, we have that examination twice a year, and we are continually going over that syllabus.

2602. Is anything done in the way of hygiene?—As regards dairy work?

2603. As regards the influence of hygiene on dairy work?—We do not make a point of sterilising milk, but we do

pasteurise on a small scale. We pasteurise all our milk for butter-making purposes, but I find in the particular locality of Reading that people will not have pasteurised milk for drinking purposes. You have to force it upon them very strongly in some districts, and even then they will not have pasteurised milk. I have a brother who has two large milk-retailing establishments, and he tells me that the public prefer good clean raw milk to that which has been treated by heat, and that it is only when there is a scare, for instance a fever scare of any kind, that he resorts to the pasteurisation of milk.

2604. Lord Barnard alluded to the necessity of standardising the quality of butter. As you are aware and as Lord Barnard has pointed out, to that is due the great success of the export trade of butter from Denmark, and the security which is given to the public in England with regard to the quality of butter in accordance with the present legislation. I do not know whether that is a subject which you have enquired into. Do you think that is sufficient?—I do not know that it covers all the loopholes. I do not think it does.

2605. Of course you are in favour of stringent measures being taken to prevent the adulterated article coming on the market?—Yes. I know of certain methods and processes connected with the butter trade that I should be sorry to describe here.

2606. (*By Lord Barnard.*) I should like to ask you a question arising out of the question that was put to you with regard to giving attention to the breeding of suitable dairy cattle. Have you by any chance received in the course of the last few months an enquiry for information on that subject from some American university. I have myself, but I cannot remember the name of it?—No, I have not received any enquiry of late.

2607. I recollect now it was on dairy shorthorns—for statistical information with regard to the milking capacity of shorthorns. I am a shorthorn breeder, as you may know?—I received a similar enquiry some time ago from *Hoards Dairyman*, an American paper, enquiring into the milking properties of the English shorthorns. The editor was under the impression that the shorthorn was an unsatisfactory dairy cow.

2608. The application to myself was certainly from a college. I merely introduced it to show the enterprise of American colleges in trying to obtain information on such an important point?—Yes.

2609. (*By the Chairman.*) I understand your view is that a great deal more has to be done with regard to research, and that you would like the Board of Agriculture to find specialists who could devote their whole time to that work of research which you have described?—Not their whole time necessarily, but a certain definite portion of their time to a college.

2610. I understand that the work is of a very intricate nature?—That is so.

2611. The number of people who are competent to conduct such research is, of course, limited, and therefore you would select the best man that was available, and do not you think it is desirable that that should be done, and that they should be allowed to devote their whole time to it?—If that arrangement could be made without bringing up a financial question, yes.

2612. I am now asking from the point of view of the importance of these experiments?—It would be desirable.

2613. (*By Professor Middleton.*) Your suggestion was that your Institute should be furnished with a fund which would enable it to engage a bacteriologist?—Yes, a fund to be set aside for bacteriological investigation.

2614. Not that a bacteriologist should be furnished by the Board, but that the funds should be furnished by the Board?—Yes.

2615. (*By the Chairman.*) You would be pleased if one was found who could devote his whole time to it?—Yes. I think the co-operation of a practical man in a scientific experiment is too often overlooked. A scientist very frequently conducts experiments which do not bear upon the difficulties of the practical side of the business.

2616. You would like such a man to be attached to the Institute, but that he should be under your direction, and that he should devote the whole of his time to such investigations?—Yes, I would like to work with such a man.

SIXTH DAY.

Thursday, 9th May, 1907.

PRESENT:

The Right Hon. Lord REAY, G.C.S.I., G.C.I.E. (*Chairman*).

The Lord BARNARD.

Lord MORETON.

Mr. F. D. ACLAND, M.P.

Mr. DAVID DAVIES, M.P.

Mr. NORMAN LAMONT, M.P.

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Professor T. H. MIDDLETON, M.A., M.Sc.

Professor WILLIAM SOMERVILLE, D.Sc.

Mr. H. S. STAVELEY-HILL, M.P.

Mr. A. E. BROOKE-HUNT (*Secretary*).

Mr. H. L. FRENCH (*Assistant Secretary*).

Sir C. THOMAS DYKE ACLAND, Bart., called and examined.

2617. (*By the Chairman.*) You are Chairman of the Experiments, of the Publications, and of the Dairy Committees of the Bath and West and Southern Counties Society, and also Chairman of the Devon County Education Committee?—Yes.

2618. Perhaps you will explain to the Committee what is the nature of the experiments that the Society carries out, their objects, methods and results?—The Experiments Committee was started about 25 years ago, I think, and it went on the principle of illustrating for the benefit of the farmers all over our district the results and principles that had been arrived at at Rothamsted, not in the way of distinct research, but for the purpose of letting farmers test, with guidance and assistance, the results of those principles on their own farms under varying circumstances. We were rather hampered for money, and so we could only have five or six experimental stations. Of course we should have liked to have had a good deal more, but the funds of the Society would not run to it. We have maintained the system of experiments from that time down to the present time, and during the last six years we have been experimenting, with the co-operation of the Board of Agriculture, on the subject of the influence of manures upon mutton. That, I think, is the chief experiment at work now. We have also five or six experiments generally devoted to questions connected with the improvement of grass land, carried on, not for purposes of research, but as illustrating principles arrived at elsewhere, so that farmers in each of their own districts should have an opportunity of seeing what has been done.

2619. That is done in various centres?—Yes, we have had sites at various different places; the sites have been moved about just according as landowners or societies put sites at our disposal. For instance, on coming down to Devonshire we asked for a clay site and a sandstone site. We also tried to get a site on the siliceous ground in the north part of the county, in order that Devonshire farmers might see as nearly as they could how far the principles arrived at were applicable to their own circumstances.

2620. Who are the persons who conduct these experiments?—We have a steward who is a very qualified man, Mr. Ashcroft, and before him we had another man who was a land agent, who was a very qualified man. We have not had any chemist to superintend it. We have always had the guidance of Dr. Voelcker in laying out the sites. He has always been co-operating with us in carrying them out, and he has reported upon them, and we have also had the assistance of Mr. Carruthers with reference to the grass experiments, and indeed with reference to wheat and barley experiments; we have always been guided with scientific assistance, but we have relied mainly on our own consulting officials, Dr. Voelcker and Mr. Carruthers.

2621. How are the funds provided?—From the Society's fund. The Government makes a special payment in connection with the experiment on the influence of manures on mutton, but had not previous to the commencement of that experiment, made grants to the Society in respect of its experimental work.

2622. You could carry out more experiments if you had more funds?—Certainly; we could multiply the sites. I do not think we should like to desert our system.

2623. Then with regard to the Journal which you publish for distribution?—We have had a Journal which has been going on for 70 or 80 years; I cannot tell you when the first number of it was published; and besides that we have been in the habit of publishing extracts from the Journal on different subjects. Here is a report on experiments, another one on dairy education, another one on the art of butter-making, and so on. These things have been published and sold at cheap rates or distributed gratis according to circumstances, sometimes the one and sometimes the other. They usually have been extracts which have been taken out of the Journal, and they have been placed at the disposal of persons who wanted them, and have been more widely distributed than the Journal itself could be.

2624. Is that a gratis distribution?—Not by the Society, but by members of the Society.

2625. The farmers read these extracts?—I think they do.

2626. And appreciate them?—Yes. I have often heard farmers express gratitude for the information they have found in the Journal, and in these extracts from it.

2627. Do they apply the hints that are given in those extracts?—Well, that is a thing that I should hardly like to say.

2628. You have travelling schools for dairying in Devon and Somerset?—We had, but they are now in both cases run by the County Council in each county, and not by the Bath and West Society. They were set on foot by the Bath and West Society, and then each county in its turn took them over. I know in Devonshire they are entirely now in the hands of the Education Committee of the County Council, but they were started by the Bath and West of England in each case.

2629. Does the County still carry on this dairy school?—Yes, and there is a big demand for it, and one which is constantly increasing; indeed, it is engaged for the next 12 months at different places in the County.

2630. Under your auspices?—Under the auspices of the County Council.

2631. But the Society does not carry on the schools any longer?—The Society handed them over to the County Councils when they were prepared to take them over.

2632. The Society has left off carrying on these dairy schools?—Yes, I think it is true to say that the Bath and West have not now any migratory butter school, but it maintained a connection with the cheese school in Somerset until quite recently.

2633. Then you have a stationary cheese school?—That is the one I am speaking of, the cheese school in Somerset. It is stationary in this respect, that it does not methodically move about like the dairy schools do. In the cheese district it has stayed on one farm, I think, for two or three years, and then moved to another farm for two or three years.

2634. In that sense it is also a travelling school?—In that sense it is a travelling school.

2635. I understand that has been taken over by the

Sir C. T. Dyke
Acland.
—
9 May, 1907.

Sir C.T. Dyke Acland. County Council in Somerset?—Yes, it is entirely managed by the County Council.

9 May, 1907. 2636. They provide the funds?—I think so.

2637. The society also had travelling farriers' schools for Somerset, Devon and Dorset?—Yes. Those again were started by the Bath and West of England Society, but were taken over in Devonshire, and also in the other two counties, entirely by the County Council. In Devon the school was abandoned for a year or two, but it is resumed again in our scheme for next year.

2638. Is that attended by farmers' sons and farmers?—No, I should say it was more attended by blacksmiths, but I think if a farmer's son wished to become a student he would be allowed to do so. It has been extremely appreciated.

2639. By the farmers?—Yes, very much indeed.

2640. What is the experience of the Agricultural Subcommittee of the Devonshire County Council with regard to lectures?—Soon after the technical education system was put into force we started some veterinary lectures, and they were attended in very various ways. In some places they were very well attended, but in other places they were scouted. Our experience was such that we did not carry them on after a year or two. We did not on the whole think that the profit gained by the farmer was sufficient to make it worth while continuing them; they were too apt to ask the professor for special prescriptions and instructions that applied to their own individual cases, and on the whole we came to the conclusion that the money was not well spent, and we gave it up. We do, however, find that instruction in agriculture, horticulture, bee-keeping and in poultry-keeping is very much appreciated. We have men going round the county under our Education Committee in Devon, and we find that that is very much appreciated, and I think that the farmers are anxious that it should be maintained, as far as I can judge.

2641. You have no difficulty in finding fit lecturers for those lectures?—No, I do not think we have any difficulty in that respect.

2642. Are there any chemical lectures?—No; I do not think purely chemical lectures have had any real value; we tried them a little, but it has not come to anything.

2643. Are there any scholarships given to farmers' sons?—About 20 years ago we offered some scholarships to farmers' sons, but they were not well taken up. We offered scholarships to farmers' sons who intended to become farmers, but we did not find them well taken up, and we, therefore, abandoned that. Then we tried an agricultural side at one of our secondary schools. That went on for a few years. I think we did get once as far as 20 students who took the agricultural side, but that has now also proved a failure, and we have abandoned it.

2644. That was an agricultural side to a technical school?—Not a technical school, an ordinary secondary school, one of the old endowed grammar schools, at Ashburton.

2645. Is it your experience that secondary education had better be general—that it is no use starting an agricultural side to secondary schools?—That is the general opinion certainly, and my own view with regard to that is that it is wiser to let the farmer's son have the widest and broadest general education that you can give him to as late a period as possible—defer the specialisation at school till the last possible moment. I think if he is a farmer's son—and I am speaking of farmers' sons—he gets sufficient experience in his ordinary life at home to enable him to learn, probably, more farming than you could teach him at school, and what you want to do is to let him have the widest and broadest general education for as long as you possibly can, and so increase his powers of reasoning and observing, and make him an intelligent and sharp lad. I do not believe you can teach practical agriculture at school; you can teach the scientific principles which affect the practice of agriculture, but the practice you cannot teach at school. I remember the school which was started at West Buckland many years ago by Prebendary Brereton and the present Lord Fortescue's grandfather. That was intended to be a school for farmers' sons, and I think there was a school farm attached to it then. The farming part of it never succeeded. The school was very well carried on and succeeded very well for a long time; it was almost the only secondary school of the middle-class type that we had for the county at that time, but of late years it has not had nearly so favourable an experience. It is very much better now

than it was, but that is not in consequence of the teaching of farming. That has not been done. The teaching of farming entirely fell through. It is a good general education of a business-like character that a farmer wants for his son.

2646. And then encourage them afterwards to go to an agricultural college if they have the means to go there?—We have had no agricultural college in the West, and I do not think that many of the farmers that I know would send their sons to an agricultural college if we had one.

2647. You do not think the want of an agricultural college in the West of England is felt?—No, I honestly do not, and I say so definitely, because three or four years ago—I cannot give you the date exactly—there was great pressure put upon us to spend some of the "whisky money" in starting an agricultural college, and many members of the committee were very sceptical about it. As far as I can recollect, we sent round circulars to different boards of guardians to find out the opinion, as well as we could, of the farmers, and my impression of it now is that out of 16 boards of guardians about 15 were against it. I cannot quite recollect the figures, but at any rate we came quite clearly to the conclusion that an agricultural college would be pure waste of money.

2648. (*By Mr. Latham.*) Is it fair to ask you to say whether you think the good teaching of our society—the Bath and West of England Society—has anything to do with that? You will admit that the teaching of the Bath and West of England Society has been very much appreciated in the West?—Yes, I think so.

2649. Your last remark I rather thought applied to that, and that, had we not had such good teaching by the Bath and West of England Society, the need, possibly, for an agricultural college might have been stronger?—I do not know that I should quite agree to that, because the teaching of the Bath and West of England Society has been available for adults, and an agricultural college, as I understand, is intended for boys, or at any rate quite young farmers, before they go into business, and I think the two cases are different.

2650. (*By the Chairman.*) Can you give the Committee any information about the continuation schools?—We find them an extremely valuable means of instruction in the country wherever we can start them. There is no question about that. I think the whole of the agricultural community, if I know anything at all about it, are well aware how fast the process of forgetting what a boy or girl learns at school sets in as soon as they leave school. I do not think there is the faintest doubt about that; it is universally known, I think. Many people say that the work of the schools is entirely wasted, because it is all forgotten so soon afterwards. I do not know how far one can carry that, but I am very convinced that continuation schools are of the utmost value. There again, however, I do not know that you can teach agriculture; I do not think you can. I think you might stimulate subjects which would be of interest in all sorts of connections with agriculture; you can teach children to observe the habits of insects, various different kinds of nature study, you can enliven them in a certain sense, you can carry further in the continuation school the object lessons which have been part of the instruction in the ordinary day school, and above all things you can foster and continue and develop their desire to learn, but I do not think you can teach them agriculture. You can give them opportunities of learning. But then you must remember that in the rural districts there are a large number of districts where a continuation school is nearly impossible—when I say it is nearly impossible I mean a school that is worth maintaining. I do not think it worth maintaining a school just for the sake of educating three or four children; and in many cases you cannot get more than that together. In many villages it is impossible to get a good nucleus together, but where you can get a good nucleus, then I think it is worth doing.

2651. Where they exist they are well attended?—That depends a great deal upon the teacher. I think they are appreciated by the pupils where they are well done, but it is, of course, quite conceivable that the teacher may make it so dull, or in some way or another alienate his pupils and make them lose their interest, and I have known them die out. As a rule, however, I should say they would be appreciated.

2652. You think they should be made attractive?—Yes.

2653. And that depends on the personality of the teacher?—To a very great extent. I am afraid that is inevitable.

*Sir C.T. Dyke
Acland.*

9 May, 1907.

2654. Then the training of teachers?—I suppose that is intended to refer to the training of teachers for elementary schools. One thing is obvious, that nature studies ought to be made an integral part of the work of all agricultural colleges and pupil-teachers' training centres. I do not say that that is done, but I think it is quite essential. I think in all training colleges, as far as it is possible, you should endeavour to get the students to appreciate the main principles of such sciences as affect agriculture and country life as you can get into the time that they have; but their time is extremely full, and I do not think that you ought to carry that instruction very far beyond what would in ordinary language be called a rather elementary stage; for two reasons, one, because if you carry it much further it entails considerably more effort on the mind, and the student is apt to think that he knows a great deal more of the science than he really does, and also this, which is more important, that he must stop the science of chemistry, or whatever science it may be, as soon as he leaves the training college, and he immediately begins to fall into the rear, as far as the science is concerned, if he has been carried on to an advanced stage. I do not think, therefore, that more than an elementary stage is really required for the purpose for which they have to learn it.

2655. What facilities exist in the various counties for the training of teachers?—There are training colleges—I cannot tell you exactly what they are—in the West of England. We have two training colleges in Devonshire, one diocesan and the other at Exeter, a day training college. The diocesan is a men's college, and the day training college at Exeter is mainly for women. At Truro there is a training college which I think is for women also. Then, of course we have under the County Council some pupil-teachers' centres.

2656. Your Society does not deal with that matter?—No; the Bath and West of England has nothing to do with that at all.

2657. Then the school gardens; what is your opinion with regard to those?—I have seen in some instances the school gardens very successfully carried out, but that again depends mainly upon the teacher. Where they can be carried out, and where the boys can devote some of their playtime to the cultivation of the garden, undoubtedly it is a very good thing for them; but I have heard the parents say that they can teach them gardening at home, and they would much rather they spent their time in the school hours in instruction of other kinds, and they do not think that the time which they give to the school ought to be wasted on what they can teach them at home. I do not say I agree with them, but that is the point of view some of the parents take.

2658. With regard to the experiments on farms, perhaps you will mention to the Committee the Seale Hayne Bequest, and what effect that has had upon it?—I may say that I know very little at present with regard to the Seale Hayne Bequest. I am speaking from the County Council point of view. Mr. Lambert is mainly responsible for the arrangements, and he has not been able to arrive at any decision as to where the site is to be, or as to how much money is to be devoted to the site, and indeed it is in a very elementary, not to say in a nebulous stage, at present.

2659. The Bequest is for the carrying out of experiments?—Yes. It is intended to establish a centre of agricultural instruction somewhere in the neighbourhood of Newton Abbot, near Exeter. That is practically all I know about it.

2660. Are there any local committees in the counties who arrange for those experiments?—For the experiments conducted under the County Council and the Bath and West of England?

2661. Yes.—No, I do not think there are. I think that the arrangements for the experiments now conducted in different parts of the county are entirely made by the agricultural sub-committee of the County Council. They are conducted by our peripatetic instructor. I am speaking with a certain amount of doubt, but I do not think there is any definite local committee.

2662. Are there any farmers' clubs who take an interest in it?—There is the County Agricultural Society, and there are various smaller local societies, but so far as I know they have nothing to do with the experiments.

2663. Then with regard to short winter courses, what is your opinion as to the usefulness of those?—I believe that something might be done in that direction either by the Seale Hayne Bequest or by arrangement with Exeter College. I think we might arrange for farmers' sons in

the county and in the adjacent counties attending short courses in special subjects at such a centre. I have heard of it being done in certain places, but I could not give you details. I believe, however, that they would be appreciated. I believe the farmers could spare their sons for five or six weeks, say, in the winter to go through a definite course of instruction at a centre not very far from their own homes. I think that might work, and I should like to see that started, but we have not the means at present to start it.

2664. You have not held any?—Not up to the present.

2665. Then with regard to research?—I have a view about that which I should like to put before the Committee. I think that the efforts of the Board of Agriculture ought, if I may venture to say ought, or at any rate might, in my opinion, be well devoted to the prosecution of research in as many centres in England as possible, with a view to the circumstances of the locality and the money available. That, I venture to think, is a special function, from that point of view, of the Board of Agriculture, and I should like to see it go further in that direction than it has at present done, but I think that the formation of the character and the development of the intellect of the agriculturist is the work of the Board of Education, and I want to see the two Boards working together on a line which would prepare the child, whether he be the son of a labourer or of a farmer, to train him to observe and reason, and so forth, and prepare him to take advantage of the work of the Board of Agriculture, to learn from the research which may be made and the illustrations of it which may be conducted in his neighbourhood. Therefore, I think we should have the two Boards doing good work all in one line, co-operating with each other. That is the picture that I have formed in my own eye of what I should like to see done. I think that is the best way in which they can work with each other. We at present in Devonshire, and I believe it is the case with other counties too, are a little bit confused as to the superintendence of the different things that we do. We have under the committee classes in thatching and hurdle-making and sheep shearing, and we have continuation schools where a certain amount of agricultural science is occasionally attempted to be taught; we have, of course, our dairy and farriery schools which I have mentioned, and we have had our agricultural side. All those have been definitely treated as instruction and education. Mr. Brooke-Hunt has done us very valuable service by coming to look over them, and very rightly too, because there are no agriculturally-trained inspectors under the Board of Education; but I venture to think the superintendence of those things and the spending of the money which was intended for instruction and given over to us for the purposes of education is a function of the Board of Education and not of the Board of Agriculture. That is a private view which perhaps I should not press on the Committee, but that is my opinion. I do not think that the Board of Education is in a position at present properly to inspect and control the expenditure of the money which is spent on such instruction as we can give of an agricultural kind.

2666. What you wish to see is that the Board of Agriculture should establish what we might call research stations to which farmers might send artificial manures or butter or anything which required analysis?—Yes.

2667. I think you have already said that you deprecate school farms and the teaching of agriculture in farm schools?—I do altogether, because either the education or the farming must go to the wall. The essence of farming, as I understand it, lies in attention to details, and strict economy and great experience and skill, and a variety of considerations which Lord Moreton at any rate knows very much better than I do. Those things are not education or instruction. The work of education is of a different sort altogether. I think, if you attend to the farm and make that pay, the school will have to go to the wall, and if you attend to the school and neglect the economy of the farm, then the farm will go to the wall. The combination of the two I do not believe to be economically possible.

2668. You have mentioned the schools at West Buckland and Ashburton?—As I have tried to explain, West Buckland is a very good secondary school, but not a good agricultural school, and it did not do any good to the farmers' sons in the way of agriculture. What it taught it taught them well, but not agriculture.

2669. Does that apply to Ashburton too?—Yes, I think it applied also to Ashburton. The farmers did send their sons there, but it did not flourish.

2670. I understand that you do not object to an experimental farm, as such, but you object to a combination of

*Sir C. T. Dyke
Acland.*

9 May, 1907.

an experimental farm with a school?—Yes, I think that is about it. But then I should say this about experimental farms, that what is true as the result of experiment of one farm is very likely, indeed probably, not true of its neighbour. What is true of a farm on one side of a valley, would probably not be true of a farm on the other side of the valley, and the same with the hills, and if you are experimenting you must be constantly moving from farm to farm.

2671. You are not in favour of experimental stations then?—No; I am not in favour of experimental stations.

2672. Although you are in favour of research stations, you are not in favour of demonstration stations?—Research is another matter, but I am not in favour of demonstration stations; I do not think you can spend money with any profit on continually demonstrating in one spot. Move your demonstrations all over the place, and interest as many farmers as you can by continually moving them about—that is my view.

2673. Then with regard to a scheme for the county, are you in favour of schemes, which, of course, ought to be very elastic, and ought to be based on the experience that has been already gained, being annually submitted to the Board of Agriculture?—I think that is quite a reasonable request from either of the Boards which supply us with funds, and intend to guide us in expending the money. I think that it would be quite a reasonable request that we should at the beginning of the year state what it is our intention to carry out during the ensuing year with the money we propose to spend. I think that is a perfectly reasonable demand; I think it will secure far more careful administration of the money, and will turn the attention of the Committees much more seriously to the whole subject, and I think it is a request that ought to be made.

2674. These schemes, you think, should be submitted to the Board of Education and the Board of Agriculture?—Yes, I think they ought to work together with reference to it.

2675. Can you give us a description of the arrangements that have been made in Devonshire by the County Council Agricultural Committee?—That is quite a recent development, and I am not quite certain that I can say that it is actually in force, but what is proposed has been proposed after consultation between the chairmen of some of the committees and Lord Fortescue, who is the Chairman of the Council. I am told that it is a similar arrangement to what has been carried out in some other counties. We have found it necessary, I should say to begin with, to establish a sort of general purposes committee of agriculture for agricultural subjects which come before the Council to be referred to. We have already had at work an agricultural sub-committee of our Education Committee, and what is proposed now is that the members of the Council who form the sub-committee of the Education Committee should form a committee for agricultural purposes, perhaps I ought to call it, and should report direct to the Council on all subjects which have anything to do with agriculture, but when they are dealing with education they will report to the General Education Committee, and their suggestions with reference to education would be under the supervision and under the control of the General Education Committee. Then I think it is proposed that for the general agricultural purposes committee they should be at liberty to co-opt other persons who would be on their committee for general purposes and would not be on their committee for purposes of education. I think that that ought to form a really valuable committee for general purposes.

2676. What is your opinion with regard to the system of the Board of Agriculture correspondents in counties?—I know so little about it that I hardly like to express an opinion—so little that I do not really know who the correspondents are in Devonshire. I ought to know, perhaps, but I have had no means of finding out, and if I wanted to go to any of the correspondents for any purpose I should not know to whom to go, and further I should not know how to find out except by referring to the Board of Agriculture itself. I do not think it is a very wise arrangement. I think the committee that we are proposing to have will be a very much more valuable means of communication with the farmers than the arrangement of correspondents is; in fact I do not know what the system is, but I have put my feeling before the Committee on that point.

2677. You have already stated that you are in favour of a central consultative committee consisting of representatives of societies for various areas over the whole country?—In London?

2678. Yes. Are you in favour of that?—Yes; the

only thing I wish to say is that it occurs to me that the Royal Agricultural Society of England ought to be able to furnish whatever that consultative committee can furnish; I should have thought that they were the natural body for reference.

2679. But you are in favour of a central body of representatives of societies in various areas which the Board of Agriculture would consult?—Yes. Though I referred to the Royal Agricultural Society of England, of course there are other societies, and it may very well be said that they ought each to have a representative on the central committee.

2680. With regard to inspection, have you any observation to offer to the Committee on that subject?—Do you mean the inspection of the expenditure—of the manner in which grants are expended?

2681. Yes.—I do not know that I can add much to what I said just now with regard to that. I think the Board of Agriculture would naturally have an inspector to visit any sites and to be in communication with any committees to which money has been devoted by that Board, and I think that the Board of Education again would naturally have inspectors for a similar purpose. But what I really wish to see is that the two Boards should put their heads together and arrange for a system such as I described just now, and arrange for inspection of the system. The whole subject is one which concerns both the Board of Agriculture and the Board of Education; it is almost impossible to cut a clear line between the two. I think the inspectors of the Board of Agriculture ought to have an *entrée* into the classes and institutions which are carried on for the purpose of instruction in agriculture, just as they ought to have in their own research stations.

2682. Your idea is that the inspection of the instruction for agricultural education should be carried on by inspectors of the Board of Agriculture?—No, not necessarily by the Board of Agriculture—not independently of the Board of Education. I want to see the whole thing treated as one under the officers of both the Boards; that is what I should like to see. I think from the very beginning, from the elementary school up to the research station, it ought to be looked upon as one subject to be dealt with both by the Board of Agriculture and by the Board of Education. I should have thought that they might have managed to work together, to have contributions for the purpose of education distributed by the Board of Education, the contributions for the purposes of research distributed by the Board of Agriculture, and the inspectors working together to see that the whole thing was done without waste.

2683. I quite understand that. I only mean, of course, you are in favour of a separate staff of inspectors of the Board of Agriculture, and a separate staff of inspectors of the Board of Education, working together?—Yes, that is what I want to see.

2684. What further development in the way of extension do you think at this moment ought to be given by the Board of Agriculture to agricultural education in the country? You, of course, have given considerable thought to that?—First of all I think they might institute some other stations of research in different parts of the country, and in connection with the stations of research I think they might encourage the farmers to consult scientific men, both for the purposes of analysis and advice, and so on, in connection with these research stations. I think that that could be done. I think that it would be a very wise policy on the part of the Board to encourage all the different local agricultural societies to conduct experiments managed by committees of their own, and guided and superintended by an inspector from the Board of Agriculture, and that these societies might be assisted with moderate grants to conduct experiments of their own, with a very free choice under proper guidance, of the different objects of the experiments. I do not think, for practical purposes of agriculture, the Board of Agriculture could do a more wise thing than to cultivate among the farmers that spirit of experiment and observation. That would be, in my opinion, a very valuable function, and so far as I know it is not at present attempted beyond the borders of the large societies that are well known, but I think it might be done in every county society.

2685. Your experience is that farmers now quite appreciate all the efforts in that direction?—The farmers would appreciate it, I think.

2686. Your experience has shown that development can best be directed in the direction of research work and the carrying out of experiments at different centres, because the farmers can better understand the practical

Sir C.T. Dyke
Acland.

9 May, 1907

value of those?—Certainly. A great advance has been made, since we started our experimental stations in Devonshire, by the farmers, and the instructor tells me that he has constantly considerable groups of farmers round him when he pays his periodical visits to these stations. That advance, as far as I can judge, is entirely owing to the institution of those stations and shows the great value of that kind of work.

2687. The farmers value his advice?—Yes, and they come and talk to him. I should say, we supply the manures for the experimental stations. The farmer himself, with the instructor, superintends of course the distribution of the manures and all that. I would not for a moment advocate the spending of money in manures to be supplied all over the place and applied indiscriminately. I do not want any wasteful expenditure of that kind, but I am sure any useful encouragement that could be given in the direction of those experiments would be extremely wise, and very useful. I am very sanguine about that.

2688. (By Lord Barnard.) I gather, Sir Thomas, from what you have told Lord Reay, that you approve very highly of research and think it very useful?—Yes; I think it is necessary.

2689. Are you aware that in many of the University agricultural departments research and instruction are carried on together?—Yes.

2690. Would you agree with me if I were to suggest that research and instruction were almost inseparable?—I do not think I should say that—I mean research can go on independently of instruction quite well, and instruction can go on without research, at least I should have thought so.

2691. I gather that you are of opinion that farmers should be encouraged to take advantage of the results of research?—Certainly.

2692. And that practically that is beginning to become the practice in the county of Devon in your district?—I hope so, and I hope all over the country too. The object of the Bath and West of England Society, as I said just now, has been to spread the results of research as well as we can do it by illustration, the illustration being to show the farmers that the thing has taken place, with the hope that they will carry the thing further themselves.

2693. I also gather that you draw, and I agree with you, if I may be permitted to say so, a very sharp line between education and instruction?—Yes.

2694. That is to say, you consider the foundation of education is to form the character and broaden the mind and intelligence, and so on of the student?—Yes.

2695. For that purpose you think an ordinary education is better than a special education?—I am inclined to defer specialisation to the last moment compatible with the career of the individual.

2696. You do not deprecate specialisation, say in University centres, of course?—No, I do not; certainly not under proper conditions.

2697. You have no University centre in the West of England, I think, which has any special department for agricultural instruction?—No, I think not.

2698. Would you think it would be a good thing if you had one?—You said for agricultural instruction.

2699. Well, higher agricultural instruction?—I do not agree with agricultural instruction, so to speak, from a University point of view. I do not think you can teach farming in that way; you can teach the science of farming, but you cannot teach farming.

2700. You have expressed it better than I did. That is really what I meant—the science connected with farming. If the science connected with farming is to continue to develop you must have instruction where such development can be carried on—where teachers can be trained, for example?—Yes, where teachers can be trained, and where scientific men can carry out research—yes, that I agree with very strongly.

2701. I suppose you are aware that in the Universities of Scotland there are a great many young men who take up the agricultural side and take degrees?—Yes.

2702. Do you not think that the system could be equally well applied all over England?—The Scotch farmer and the English farmer are very different creatures. I believe the Scotchman thinks a great deal more of that kind of requirement—a diploma, and so forth—than the English farmer at present does. It is possible that you might get an English farmer to take that line more than

he does at present. At present his great anxiety is to get his boy back to the farm as soon as he can and teach him the practice of farming. As far as my experience goes he does not hold much by the specialised instruction off the farm. That is my experience. I do not say whether it is right or wrong, but that is their view.

2703. He is beginning to appreciate more and more the advantages which can be obtained from science in connection with his industry?—That lies at the back of my suggestion that the research stations should be multiplied. I think the more research stations are multiplied about the country, the more the farmers will begin to see actually what science means, and therefore they would be anxious for their boys to get whatever benefit they could from seeing the results of science achieved before their eyes.

2704. You will agree with me that the opinion of the farming classes is changing and developing in that respect?—Certainly.

2705. And that we must not regard the present position as final at all?—No.

2706. We must go on?—Yes.

2707. I should like to ask you a question with regard to your suggestion that the Board of Agriculture and the Board of Education should co-operate. I know you have had great experience with regard to departments, Sir Thomas. Do you think that two departments could work together conveniently?—I should have thought they might. I should have thought that for that purpose you might have let your inspectors of education and your inspectors of agriculture consult together and with the sanction of their superiors carry out some definite scheme of inspection, of general superintendence. I should have thought that was possible.

2708. You are in favour then of the further development of the Government control, we will call it, of the research work to which you specially allude—that it should be taken up more by the central department of the Government, or at any rate that the initiation of it should be left to the central department of the Government, and that it should not be left to the counties to do it?—Research work you are speaking of?

2709. Yes?—If you want to develop it, I think you will have to resort to some extent to the Imperial Exchequer, and of course whenever that takes place, you must have Government control.

2710. I suppose you are not of opinion that this £10,500 which was granted last year by the Board of Agriculture was entirely useless?—Not useless, I should like to see it doubled. We must be thankful for small mercies, that is all.

2711. I was very much interested in your remarks about the Board of Agriculture Correspondents. You do think that the system of the Board of Agriculture being locally in touch with each county as a unit is of value although you do not, perhaps, approve of the actual system of individual correspondents?—I do not quite understand what the intention of the Board in instituting the correspondents was, but as far as I know it has not had very much fruit in the counties that I know.

2712. That is my experience also. I was wondering whether you could suggest—I think you did suggest to the Chairman, in fact, that you thought that that system might be further developed by having some sort of local committee in each county?—We have got a County Council elected for the general business of the county, and I cannot help thinking if we have a kind of general agricultural purposes committee on the County Council that the Board of Agriculture might do a good deal through that committee. It might ask that committee to collect information for it; it might ask that committee to superintend the expenditure of funds; it might ask that committee to inform the Board whether any special development or any special needs existed in the county. It seems to me that that is the only possible channel of communication.

2713. I am speaking from my experience, of course, of my own county. In my county—the county of Durham—although there is a considerable amount of farming, agriculture is entirely overshadowed by mining and other industrial pursuits. Do you think that such a system would be suitable in such a county?—That is a thing that I, not living in Durham but living at the other end of England, should not like to say.

2714. In our last County Council—I do not know about the present one—we had only two persons out of the whole number who were in any way associated directly or indirectly with agriculture?—With reference to Durham

Sir C. T. Dyke I do not care to express an opinion, but with regard to Devon and Somerset, and the adjacent counties, I am prepared to do so.
Acland:
 9 May, 1907.

2715. You consider the Royal Agricultural Society might be a type of a good central information and intelligence department?—It is a great society covering the whole country, and I think that would be a very natural source of reference for the Board, and that is the object of the proposed consultative committee, I understand.

2716. You would not object to the Central Chamber of Agriculture, I suppose, being associated with that committee?—No, if any body of that kind is contemplated perhaps it would be wise to elect upon it representatives of all the leading societies interested in agriculture.

2717. (*By Mr. Acland.*) I notice from the return which we have here from the Board of Agriculture, that last year Devonshire spent about one-sixth of its "whisky money" on agricultural education, Cornwall a third, Somersetshire a fifth, and Dorsetshire and Wiltshire about one-fourth. Devonshire comes in considerably lower than any of the West of England counties. Is there any special reason in Devonshire which has made the proportion of the "whisky money" spent on education comparatively small. Is there a feeling against it in the county?—No, I do not think there is.

2718. Do you have special demands in Devonshire for secondary education, pure and simple—very heavy demands for aiding the secondary schools which would rather pinch the agricultural education?—We have recently developed and passed through the Council a scheme which ought to eventually produce five or six good secondary schools which will be available for the sons and daughters of rural and urban communities, and we so far are of opinion that we may not require more than a half-penny rate for that purpose, but the County Council does not like that half-penny rate. It was given, but it was given, if I may say so, with rather a bad grace. The scheme was once thrown back and on that occasion it was thrown back, I think, mainly because we proposed to take away the sum of £150, which was spent in prizes for the students of our dairy school. We thought the expenditure a wasteful one, and we endeavoured to retrench in that respect, but the Council would not have it at any cost, and as that was the feature of our scheme, they sent the scheme back and delayed it by a year. However, the grant is insisted upon by the Council, and now the scheme has gone through.

2719. I gather there is a very great pressure and a great number of demands on your money available for education other than elementary?—Yes, but there is not any great feeling against one part of that expenditure, rather than another, by the ratepayers.

2720. May I put it in another way: is the increasing pressure on this education money which has grown in the last few years developed particularly with regard to agricultural education, or to put it in this way, farmers having to pay a big new elementary rate, have they complained that so much money is going for agricultural education?—No, I do not think they have. There has been no complaint about money being devoted to agricultural education. I think that some persons not interested in agriculture have been inclined to think that a certain amount of money which has been devoted to such things as agricultural processes has been rather wastefully conducted. It has been often said we do not get the proper class of persons to go to these classes. It has often been said that the money goes into the hands of skilled thatchers and sheep shearers, and so on, and does not help the farmers, but I think the farmers themselves value these courses a great deal, and I should say the pressure is more in the direction, from the farmers, at any rate, of our spending more money for agricultural purposes than the other way. I should say the Council was generally in sympathy with expenditure on agricultural education.

2721. May I take it that if you had more money generally available you would not anticipate strong opposition in the county to spending the same sort of proportion as you at present spend on agriculture for that purpose in the future?—No, I think not.

2722. If you had more money, what is the chief purpose for which you would wish to use it in order to do work which would be appreciated by the farmers—research?—I am afraid that question has taken me rather by surprise, as it has been such an extremely improbable contingency that I had not thought about it. But I think that research and experiments are the most useful directions for expenditure.

2723. You would be inclined to spend money on research

and experiments rather than on itinerant lecturers, or on permanent courses at a permanent centre?—I think, if there was a good permanent centre, that the encouragement of those short courses that I spoke of would be well worth attempting. I cannot say that it would succeed, but my impression is that it would.

2724. You think although those short courses would probably succeed that there would be no demand, or no demand worth supplying, for anything more than short courses?—I do not know that I could put it so strongly as that, but I am not very sanguine that the farmers would send their sons away after the secondary school stage is past for any long period; I do not think they would. My impression is that in Devonshire and Somersetshire and Cornwall at present there is not much inclination in that direction, I think, and the money would very likely be wasted for some years.

2725. Yet you said there had been in the past considerable pressure that you should establish a permanent college?—Yes.

2726. From whom did that pressure come?—Newspapers! We did not find that there was anything real at the back of it. We did our best to find out, and I think the whole committee were convinced that there was nothing in it really. I think I am perfectly accurate in saying that it was much more newspapers than anything else.

2727. I noticed yesterday, when we had evidence from the Dairy Farmers' Institute at Reading that they told us that a considerable number of students had come to their Institute from the western counties. Do you think that young farmers have gone from the western counties to other centres or institutions in any large numbers?—For instruction do you mean?

2728. Yes, for instruction?—Not so far as I know; I am absolutely unaware of any. I do not say there are none, I only say I do not know of them.

2729. You do not think that the deficiency of such institutions in the west is made up by their existence in other parts of England—from the point of view of the west?—I do not wish in any way to discourage the foundation and development of the Seale Hayne College at all. I think, under careful consideration and wise guidance, that a very valuable institution may be erected.

2730. You think, considering that you have money available you could spend it in better ways than that?—I think we could spend our present money in better ways. I should be loth to set up an institution with the money we have in our hands. We have far more to do with it than we can conveniently do.

2731. I suppose you think, from the point of view of research, that there is a great deal that can be discovered by working away year after year at one place?—On the lines on which such institutions have been carried on?

2732. As at Garforth, near Leeds, with regard to the manures and cropping and deterioration and so on?—Yes. I have no doubt that research of that kind is very necessary and very beneficial, but I do not say that research must be confined to that kind of thing.

2733. Again, you would say you could find more useful things to spend your money on than in that kind of research?—I think we spend our money in Devonshire a good deal better in the interests of farmers in affording them the means of apprehending the stage that research has already arrived at than we should by devoting our money to the purposes of research, because, as far as my experience goes, research cannot be carried on without very heavy expenditure, and our money does not admit of it.

2734. The research which you favour is rather educational research than research which is slowly and laboriously going to add a little mite to agricultural knowledge. It is the educational research that you have mainly in view?—I rather distinguish between education and research—I tried to just now. My view is that research is one thing and education is another, and that you cannot quite combine the two.

2735. I mean demonstration.—That I am quite in favour of. I think that is part of the educational object that I think we ought to devote ourselves to, not original research. Original research is one thing and the illustration of the results of original research is another, and that is the thing that I believe our committee ought to take up.

2736. You spoke of the labourers. Is there any complaint as to the want of skill or aptitude on the part of young labourers in the West of England?—That is rather a difficult question. I constantly hear it said that we never

2720a

find any of the fine old labourers that we inherited, and we do not see any new ones coming to take their place, and I occasionally hear farmers say that they are hard up for labour. I think there is some truth in that, though I am inclined to believe that there are labourers to be had if a farmer exerts himself in the right way to get them. I am not very despondent about that. I think that the old hands among the labourers are somewhat averse to encouraging the learning of their arts by the young hands. That has been my experience. I mean a thatcher, for instance, will be very unwilling indeed to train a young thatcher, although the thatching trade has nearly gone out. A hurdle-maker again—I will not say he will not do it if he is paid for it, but it is very difficult to get that well taken up and carried out.

2737. If you had more means, could you do more than you do for the education of the labourer?—In that kind of skill?

2738. Yes. You have evening schools, and you have classes in agricultural processes?—Yes.

2739. Do you think there is anything more that you could do to get hold of the labourer?—I think farmers would be glad to see expenditure of that kind if it could be done practically, and the money not wasted. It requires a great deal of strict superintendence, personal interest and contact with the actual work. I know of no channel through which our money has flowed in which it has been so difficult to prevent waste; but I think it is well worth doing.

2740. You think it is well worth doing?—Very well worth doing if it can be done, only it must be done with considerable care.

2741. In advising the setting up of a consultative committee, putting apart the question of the composition of that committee, had you in mind a body similar in functions to the consultative committee of the Board of Education?—Yes, I think I had.

2742. An advisory, but not an administrative body?—Yes.

2743. Distinctly not administrative?—Distinctly not responsible for administration.

2744. Yes. You were asked how the Board of Agriculture could, by additional expenditure, encourage farmers to take interest in the results of science. Have you considered whether the Board of Agriculture could directly do anything at the larger shows in the country, such as the Bath and West of England Show, by having stands and lecturing on the results of experiments during the year, and that kind of thing?—I do not think that a show yard is a very good place for a lecture. That is my experience. They do take place, but I do not think the farmers get a great deal from them. This is my view rather: it may be a one-sided view. I do not mean to say that where you have got a dairy school as we have at work that a good dairy lecturer may not, with an audience collected for the express purpose of hearing him on a particular subject, give a very interesting and instructive lecture, but I think, as I said before, a show yard is not a very good place in which to have a lecture.

2745. You do not think the Board of Agriculture could usefully do more than they now do in connection with shows?—There is one thing I should like to see, if it was possible for the Board of Agriculture to do, and that is, if they had in their possession what they could lend to shows, such things as diagrams or specimens, or models of such things as injurious insects, the various ways of treating timber, and many other such subjects that would occur to us. I think if they could lend diagrams of that kind to societies who could exhibit them for a short time, it might stimulate interest which would lead to subsequent inquiries. It would not be a very expensive thing to do, and I think it might be very useful.

2746. (By Mr. Staveley-Hill.) With regard to the veterinary classes which you spoke of—and I was sorry to hear you say they were not a success—were the lecturers or instructors that you had in veterinary science members of the veterinary profession in your neighbourhood?—He was a member of the Veterinary College, I think.

2747. Did you find any difficulty or disinclination on the part of the veterinary profession to give these lectures or instruction?—Any unwillingness do you mean on their part?

2748. Yes?—No.

2749. Were those classes well attended?—They varied very much indeed; it is almost impossible to tell. There were some places where, on market day, you would get a

room full, and there were other places where, on market days, you would not get one. It was almost impossible for us to foresee. I think they were of some value, but I doubt whether they justified the cost. On the whole, we came to the conclusion they did not.

2750. Was the result the same in all the three counties that you have named?—No, I only speak with any certainty of Devonshire. I have not been in connection with the committees of either Somerset or Cornwall.

2751. (By Lord Merton.) As regards the consultative committee, of which we have heard a good deal this morning, would you mind telling me exactly what you think it ought to do. Could you imagine an instance where it would be appealed to. I want to get at what your idea is as to the scope of its work. I do not feel that I quite understand what it would have to do. Supposing there was a consultative committee in existence now, Sir Thomas, in the City of London, and that your county of Devon had a subject that they wanted to put before it, what sort of subject would that be—what sort of questions would come up?—I have not thought that out very much, but it occurs to me that a body of that kind might give valuable advice, or might help in getting information at any rate for such a thing as the regulations about diseases, and work of that kind. They might give an opinion to the Board as to how such regulations are working, or what modifications are required, and so on. I do not say that is a very essential thing, but that is the sort of thing.

2752. You spoke about giving information to the Board. I rather gathered at first that the object of the consultative committee was not so much to benefit, if I may say so, the Board of Agriculture, but as setting up a body that might be of use to county associations or county societies, and I was rather thinking that the primary object would be in helping rural work?—Helping rural work?

2753. Well, county work—rural work—or is it simply a go-between between the Board of Agriculture and the counties?—That is what I thought was intended—a kind of go-between between the Board of Agriculture and the people in the rural districts.

2754. In your opinion it would be better to set up such a body rather than to get the Board of Agriculture into closer contact and touch directly with the districts?—I do not see how the Board can get in touch except through its inspectors. As I have already told the Committee, I do not know how the system of correspondents works; I do not know who they are even in my own district.

2755. Nor do I.—And so far as I am concerned, the system does not exist; I know nothing of it, and if anything of the kind is contemplated I should have thought that some kind of committee such as was described, consisting of representatives of the various institutions, would have been a very good way to arrive at it.

2756. I should like to ask one or two questions about the farriery, and veterinary instruction. I think you said the farriery instruction was appreciated?—Very much indeed.

2757. Do you think it has left permanent benefits behind?—Oh, yes. After the farriery school had been through a district, I have often been told by the farmers they were extremely grateful for it—I mean in this sort of way, that it prevented their horses being damaged, because the smiths had been well trained.

2758. Did you find any professional jealousy against it?—No, we never found any at all.

2759. To go to veterinary instruction, it is very curious what you tell us, that in certain districts on certain days the lectures are dead failures, whereas in other districts they were great successes?—Yes.

2760. May I ask if the same lecturer experienced success one day and failure another?—Yes, the same lecturer; it was quite a mystery to us.

2761. I suppose there was no professional jealousy coming in?—Of course, that might have taken place without our knowing it. It was very astonishing to us to see how very much the different districts, and not very far from each other, varied in that respect.

2762. (By Mr. Latham.) I think we may fairly take it for granted, looking at the map yonder, that the Bath and West of England Society has done as much as was possible to be done in scientific education, considering that there was no college in their district?—I think that the Bath and West of England has done all that it could to promote the instruction of farmers in its district, but there could be no college that would cover the whole district of the

Sir C. T. Dyke
Acland.

Sir C.T. Dyke
Acland.

9 May, 1907.

Bath and West, because you know it takes in the Southern counties as well. It has never been in relation to any particular college.

2763. We know what a very great stride the dairying industry has made in the West?—Yes.

2764. Possibly greater than in any other part of England. Is not that almost entirely in consequence of the action of the Bath and West of England Society?—Yes, certainly.

2765. Going back to the cheese schools, that is almost entirely the work of the Bath and West of England Society?—Quite.

2766. You said the cheese schools were located for two or three years in one district?—Yes.

2767. They have done an immense deal of good in trying to find out certain soils which were very injurious to cheese-making?—Yes, I think Professor Lloyd, who has been working with them, has been carrying on a very careful investigation of all the circumstances that affect the making of cheese, and I think he has arrived at some valuable results.

2768. The results of those enquiries and this teaching are published in the Journal of the Society?—Yes.

2769. Those go out broadcast and do an immense deal of good?—Yes.

2770. I should like just to say with regard to the shoeing classes, because I am steward of the department, they have done a great deal of good?—Yes, an immense deal of good.

2771. Not only confined to your own district, but it has gone through Wales and different parts?—That is so. May I add that the Cider Institute has its origin, I believe, in some of the things that were going on under the auspices of the Bath and West of England?

2772. With regard to the scholarships that used to be offered, were they offered by the Bath and West of England Society?—No, not in my time. I do not think I remember any scholarships being offered by that Society.

2773. That is my experience also, but I was rather under the impression that you did say that you offered scholarships, and I thought you must be alluding to the County Councils?—Yes, I was alluding to the County Councils. Perhaps I did not make that clear. I do not remember the Bath and West of England ever having offered a scholarship, and I have been connected with them for many years.

2774. You say sometimes the lectures were very successful, and sometimes they were not successful?—That is so.

2775. Were they always on the same subject when they were successful?—Yes, that is what I meant; I was thinking then of the veterinary lectures. I forget now what the subject was—I am afraid I cannot recall it—but there was a course of lectures by a qualified member of the veterinary college that was very much appreciated in some places; but, as I said, we had class after class in different subjects, and the results never could be foreseen.

2776. We know well enough that the travelling dairy in the Bath and West of England is almost a national institution, is not it?—The travelling dairy has been started some 20 years, and has been at work with increasing appreciation the whole time. There never has been a time during which the work of the travelling dairy school has not been bespoken months in advance.

2777. I think you said just now that there was a little feeling in the County Council that possibly the money allocated there for prizes was not for a good object?—We thought it was very wasteful. Our experience led us to believe that the dairy school would be no worse if those prizes were discontinued.

2778. You are well aware that the students who came to the competitions came from all over England?—I believe they did.

2779. And that the good teaching that was given there was very much appreciated by the dairy world?—Very much. I suppose most of the students were local.

2780. I think not?—That I cannot say.

2781. Do you think farmers' sons can be taught better scientifically in these various colleges, or whether they can be taught possibly in a better way in the way of making a living in their own occupations?—I am afraid that is a subject on which I can only speak theoretically and not practically, because I have had no sons to educate myself; but if I was a farmer, or had to advise a farmer, my views would be to keep the boy's education and instruction as wide and as broad, but as unspecialised, as possible, until he was at least 16; but I think after 16, if his father

can spare him, that another year or two would not be wastefully spent at some special agricultural college or set of classes. But I am very anxious indeed that the specialisation should be postponed to the latest possible moment. I do not mean to say that a boy cannot be usefully taught the elements of some science, or more than one—two or three sciences. I think it would be very much to his advantage that he should learn the elements of some sciences before he goes out to work on the farm.

2782. With regard to the experiments that have been conducted, I know they have not been very large, but they have been very successful?—Yes, certainly.

2783. They have always been carried out with the idea of being practical?—Most decidedly.

2784. You made a remark just now that the difference in soils is so great on different sides of the valley that it is almost impossible to teach on one united line?—What I meant by that was that the conclusions which you may derive from an experiment carried on upon a farm on one side of a valley might be very erroneous for the guidance of a farmer on the other side of the valley. As you know, the aspect, the shelter, the soil, the command of water, and all sorts of things are different upon every farm, and therefore a farmer has to think for himself whether he can really infer from what he sees on another farm, that what answers there will answer on his own.

2785. I think you also agree that the research that is likely to be propagated by the colleges and institutions is of a very different character from what had been started by the Bath and West of England Society?—Yes; the Bath and West of England Society's experiments, except in reference to the operations of Professor Lloyd with reference to cider and cheese, have never been in the direction of original research.

2786. With regard to the cider, the Bath and West of England Society were premiers in making any organised attempt to deal with that by the aid of scientific education?—Yes.

2787. I was very disappointed to hear the remarks about the Board of Agriculture Correspondents. I am a Correspondent myself, and although I should not like to say they do the thing any better in Oxfordshire than in other places, still I always try to do the best I can, and possibly they do the same, and I have found the system has been of great use?—I cannot say the same in our case.

2788. You are supported by Lord Moreton and Lord Barnard, so you are not alone in your experience, but we always think they are useful?—I will not say they are useless, but I have not found out their use yet.

2789. You made a very strong recommendation, one that I very much agree with, that the Board of Agriculture might do a great deal more for our local agricultural shows?—I think so.

2790. Would you tell us in what way you would suggest that the Board of Agriculture could be useful in that respect?—As I said just now, I think they might encourage local societies to take up experiments, and they might superintend the experiments and guide them and develop them.

2791. To go back to Lord Moreton's question as to a consultative committee, would not that be the very thing that would be useful to the societies to send up their returns to?—Yes, I think certainly when constituted it would be of the very greatest use in advising the Board how it could best work with those local societies; that is one of the subjects on which they would do good.

2792. Do not you think it would be very useful in all the large shows if the Board of Agriculture would endeavour to assist such a side as they have at the Royal, with regard to research in the different values of manures and soils? I think that is most instructive, and one of the best sides to agriculture?—Yes, I can conceive directions in which the Board of Agriculture might do a great deal to stimulate interest in the study of agriculture through the means of these county societies.

2793. I know the Royal Agricultural Society has done an immense amount of good to us, and the Board of Agriculture would be exceedingly useful also if they would take that matter up, and it would be money well spent?—I think so.

2794. Now, with regard to labourers, it is possible that the reports sent in from Devon and Somerset show that there has been a great deal done for labourers in those two counties?—Yes, in the way of instruction.

2795. Yes, in the way of instruction. We have done a good deal for them, no doubt, and it has done good?—Yes, I

think it has done good, and I should like to see more done; but I am bound to say I am not prepared with any suggestion as to how more can be done; it is a very difficult subject.

2796. I am aware of that. Do you get a superior man in your district to be your instructor?—In some cases, yes. I have seen some very good instructors who are old hands, good old labourers; but sometimes you cannot get them to do it.

2797. I quite agree. I think the great success of the farriery school was, we always had a registered shoeing smith to be the shoeing instructor—a man after their own heart?—Yes.

2798. Does that apply to the sheep-shearing and hedge-trimming and rick-building, and so on?—There is no analogous institution.

2799. I quite agree; but in the districts of all agricultural societies they have prizes for ploughing, and rick-building and sheep-shearing, and that sort of thing?—We have done that.

2800. Do the champions of these several societies teach the men?—I do not think they do much.

2801. The great secret of the failure, in all probability, is that too high a class of man is engaged to teach. I know men of agricultural pursuits are very much against being taught by men who do not know what they are teaching about?—That is very true, but there are two sides to that. A man may be a first-rate workman and a very bad teacher.

2802. I quite agree.—Of course, if the Board of Agriculture were able to take such a subject as that in hand a good deal might be done in the way of getting good workmen to teach. I do not know how far that could be done. I have never considered the subject, but it would be a very good thing if it could be done. I do not know whether it can.

2803. Lastly, it is quite fair to say that should the Board of Agriculture feel inclined to spend some more money on agriculture, there is ample room for it to be done?—Ample.

2804. (*By Dr. Somerville.*) With regard to the Agricultural Correspondents of the Board who were appointed to keep the Board informed of the requirements of local authorities as regards various things, amongst other things as regards education, might I ask whether you are acquainted with a volume that is issued annually, which gives an account of the proceedings of the Board in what is called the Intelligence Division. Do you know this annual publication?—I do not think I do. May I look at it?

2805. Certainly. (*Handling volume.*) In the appendix, annually issued, there is a list of all the Agricultural Correspondents?—I do not think I have seen this volume before, as far as I know: I do not think I have come across it.

2806. Are you aware that a list of the Agricultural Correspondents of the Board is exposed in every rural post office in the United Kingdom?—I did not know it.

2807. That is an arrangement which the Board of Agriculture made with the concurrence of the Post Office, and in every rural post office, I believe, in the United Kingdom, the names of the correspondents are exhibited?—I was not aware of it. May I, in connection with that, venture to make a suggestion? I do not think what I am going to suggest has been done, but I think the Board might usefully send to every post office a certain number of copies of its leaflets, and request the postmaster to keep a list of those leaflets accessible, and the names of the last few posted in its window.

2808. By permission of the Chairman I am allowed to ask you whether, in your opinion, instruction in forestry might be developed in the south west of England?—I hardly know quite what kind of instruction in forestry you are contemplating. I can hardly give an answer to the question.

2809. In the north of England, in connection with the centre at Newcastle, and in the north of Wales, in connection with the University College at Bangor, there have been appointed, with the support of the Board of Agriculture, expert foresters, and the duties of these men are to give instruction to woodmen and others interested in forestry at local centres, and their services are available as regards advice for anyone who has woods, the advice not being given for nothing, but for a comparatively small fee. Do you think that the woodland owners in Devon would take advantage of such expert advice if it were thoroughly sound

and thoroughly in conformity with local conditions, if facilities were given for the obtaining of such advice?—I should hardly like to say. I know that Lord Fortescue has recently had his woods reported upon, and a very valuable report was given to him; but I do not think it was done by one of the Board's men, as far as I know.

2810. That was done by Professor Fisher of Oxford?—That was not one of the persons to whom you allude?

2811. No?—I could not venture to give an opinion as to what the large landowners would do. I think foresters are appointed for most of the woods in the hands of large landowners. One landowner, who is possessed of more of that kind of land than anybody else in his county, has an extremely able forester of his own, but I doubt whether they would generally be much appreciated.

2812. (*By Mr. Medd.*) In regard to the future relationship of the Board of Agriculture to the Board of Education, you desire, of course, to see complete co-operation between the two Boards?—Yes; I think it is extremely important.

2813. You do not suggest that the educational work of the Board of Agriculture should be wholly transferred to the Board of Education?—No. As I tried to explain just now, I think it ought to be regarded as one whole—from the elementary school up to the research station—and I want the two Boards to take interest in it.

2814. You might put it in this way, perhaps, that the Board of Education should be primarily responsible for all that comes under the head of general education; that is to say, all the work done in elementary and secondary schools and the training colleges. The Board of Education would be responsible for that?—It seems naturally so.

2815. And the Board of Agriculture, on the other hand, would be primarily responsible for all technical instruction bearing on the industry of agriculture as given in agricultural schools and colleges, the two Boards working in union with regard to the supervision and inspection, but the Board of Agriculture being primarily responsible for the technical and industrial training, the Board of Education for the educational work?—Yes, I think I should say so.

2816. With regard to this report, it had not come under your notice before. (*Handling volume*)?—No.

2817. That report does not concern any question which comes within the scope of this enquiry; it does not deal in the least with educational matters, and therefore it is not to be wondered at that you have not come in contact with the Correspondents. The Correspondents, the names of whom are given in that Report appear to be wholly concerned with purely agricultural and not educational matters?—Yes.

2818. Can you suggest any way in which the literature of the Board of Agriculture might be made more accessible to those interested in it?—I should like to see it sent to the post offices throughout the rural districts.

2819. The literature itself sent to the post offices?—Yes. I think all the literature which is distributed gratis by the Board should be sent out to every rural post office in the country.

2820. All the pamphlets and leaflets?—Yes; and not only that they should be accessible there, but that their accessibility should be made well known.

2821. You are Chairman of the Devon Education Committee and you have various other appointments, and yet you find some difficulty in ascertaining what is issued by the Board of Agriculture in the way of literature?—The Board very kindly send me most of their leaflets.

2822. They do not appear to have sent you that Report?—I do not remember to have seen it.

2823. Unless you apply for it the literature is not brought to the doors either of the farmer or of the labourer under the present system. They have to apply for it?—That is so.

2824. In other countries there is a wide distribution of literature, which is made accessible to people interested in the cultivation of the soil, is not that so?—Yes, and I think more might be done in our own country.

2825. With regard to the disinclination of Devon to establish an agricultural college probably the idea to establish one was suggested after the establishment of the present existing colleges. Do you remember when the idea was mentioned?—The unwillingness was to establishing a college out of the "whisky money"; we simply had not got the money to do it.

2826. Exactly, that is what I was going to say. In the case of the other colleges they enjoy endowments, or they

Sir C.T. Dyke
Acland.

9 May, 1907

Sir C.T. Dyke
Acland.

9 May, 1907.

are directly connected with a university, and no county to-day could afford the capital expenditure to have one of their own?—We certainly could not.

2827. And no other county could. Of course, in the remarks you have made, you do not wish to disparage, in any way, the Seale Hayne Bequest?—Not in the least. I think I may say that our committee look forward to that as an extremely useful thing, and we are very anxious that the scheme should be carefully thought out, and we shall do our best to develop it.

2828. In other words, if a county enjoys a large bequest or endowment, and can thereby establish an agricultural college, it would be a benefit for agricultural research and education to that locality?—When you say an agricultural college, I suppose I must admit that phrase on the whole, although I am not sanguine that the farmers will send their sons for any long time away from their farms after their school days—I am not sanguine about that.

2829. That depends upon the growth of opinion. They have succeeded in Denmark, for instance. It also depends on various social and economic circumstances which may alter in time, and there is no serious reason why what succeeds elsewhere may not succeed here. It only requires time?—There is no reason why it should not. Of course, the supply may create the demand; I cannot say.

2830. With regard to the suggested consultative committee, its duties and functions would be analogous to those of the similar bodies connected with the department in Ireland and the Ministries of Agriculture, say, in France and Holland. It would be an advisory committee, and it would consolidate agricultural opinion, and bring pressure to bear upon the Board concerned with agricultural interests?—It occurs to me it might be a most useful instrument in that way.

2831. You were a member of the Executive Committee of the Agricultural Education Committee?—Yes.

2832. The views which you have expressed here to-day in regard to the co-operation between the two Boards, and the need for larger funds, and an increase in the inspectorate and the distribution of literature, and the appointment of a consultative committee, were embodied in resolutions passed by that Executive Committee some years ago?—Yes, I think so.

2833. Those resolutions * still remain a practicable policy in regard to agricultural education?—Yes, with the exception of No. 5.

2834. With regard to the training of teachers, you have no facilities at all in Devon for the training of existing teachers?—You mean special agricultural instruction?

2835. Yes, the training of them in agricultural subjects. You have not started short courses for them?—No, but we have had some Saturday classes.

2836. They are not mentioned in this Report of the Board. You have had them?—Yes, we have had them in past years to which teachers could go.

2837. They are not being held now?—No, they have been discontinued. I do not think there are any classes included in this year's scheme; but there have been some to which teachers were encouraged to go.

2838. You are aware, are you not, that a third year's course of training may be had by an acting teacher at agricultural or horticultural institutions?—I have heard that, but I did not know it until yesterday.

2839. And arrangements are now being made at Wye for males, and at Swanley for females, to enable them to get such a third year's course of training. Are you aware of that?—I am a little sceptical about the usefulness of it. I do not think the teachers in the elementary schools could do very much in the way of what could be

really called agricultural instruction. I am very anxious now to see them well taught in nature study and the art of encouraging nature study among the children; but I do not think I want to see the elementary teachers, either male or female, carried on beyond that.

2840. You have not seen the schemes suggested for them at these institutions, have you?—No, I have not; but I know this, that the curriculum in training colleges is so extremely full now that I cannot believe you will, with much usefulness, add an advanced study of science of any kind to their present curriculum.

2841. This training would not be, of course, at the training college, but would be at the agricultural or horticultural institution?—Quite so, but as I understand it, it is to be carrying to a rather advanced stage their instruction in agriculture and horticulture.

2842. No. I may mention that the specific subjects of horticulture and agriculture are absolutely excluded. The whole scheme is devoted to what you rightly term nature study, that is to say, the study of plant and animal and insect life?—I could not say a word against that, certainly; I am very anxious to see that carried out.

2843. I was at the Board of Education the other day in reference to it when the Principal of Wye discussed a scheme, and that is exclusively the subject. With that you would agree?—I quite agree that I want to see that taken up, but it occurred to me when I heard it spoken of yesterday at the meeting of the County Councils' Association, I do not see where the money is going to come from. It may come from the Government to a certain extent.

2844. The Government is a party—But at present the cost of the training colleges is considerable, and you will have to add half as much again in order to carry it out.

2845. The grant from the Board of Education in the case of males would cover the cost with the exception of about £10 or £12. The Government would give the third year with the exception of a few pounds. With regard to the school gardening, you spoke of the attitude of certain parents. Have you found much objection on the part of parents with regard to school gardening?—I do not think that can be considered a serious difficulty. I only meant to say that that was the attitude that was taken up at the time by the parents, and that you cannot be absolutely sanguine with regard to school gardens.

2846. The attitude of the parents in Kent and Surrey is, as we have been informed, that they have welcomed it?—I also think that in Devonshire, as the school gardens multiply, the appreciation of them will grow. I have seen some very well carried out, but I do think, and I am sure the parents agree with me, that the more the boys can be got to use their playtime, rather than their school-time in the gardens, the better it will be for them.

2847. You spoke of the great importance of a practical and attractive continuation school?—Yes.

2848. I think you have been in favour of a suggestion that under certain circumstances boys should be released from attendance at the day school at the age of 12 to attend a continuation school up to the age of 16, under special circumstances and in particular localities?—For the boys for whom that could be arranged, I think it would be a very good thing, but you must remember that although we can take children about in the daytime in vans from remote places to the schools we want them to get to, we could not arrange it at continuation schools.

2849. (By Professor Middleton.) I have listened with great interest to your evidence, and I shall not detain you with many questions. When you were asked by the Chairman if you had any suggestions to make with regard to development by the Board of Agriculture, you placed first that the Board should institute some additional

* The following is a copy of the Resolutions referred to:—

ORGANISATION OF AGRICULTURAL EDUCATION.

Resolutions adopted at a General Meeting of the Committee on December 12th, 1901.

"1.—That, if the Board of Agriculture retain their present educational work, it is essential that there shall be complete co-operation between that Board and the Board of Education on all educational matters specially affecting the agricultural classes."

"2.—That for the purposes of agricultural education the country should be divided into districts, and such inspectors appointed as may be necessary."

"3.—That groups of counties, not yet affiliated to any collegiate centre, should be formed, each group being affiliated to some centre."

"4.—That, after due enquiry, reports should be issued dealing with the most appropriate forms of agricultural education for each county."

"5.—That permanent Demonstration Stations should be organised in each county or group of counties."

"6.—That official information bearing upon all matters of agricultural interest, whether educational or otherwise, should be distributed to the public free of cost."

"7.—That to carry out the above objects it is essential that larger funds be placed at the disposal of the Board of Agriculture for educational purposes."

"8.—That the work of the Board of Agriculture might be facilitated by the appointment of a Consultative Committee on the analogy of those of the Board of Education and of the Department of Agriculture in Ireland."

stations for research and enquiry?—I think it would be an advantage if it could be done.

2850. Your great object is to stimulate the interest of farmers and to make them think more about scientific matters?—Yes, and appreciate the results of the work of scientific men.

2851. You suggested that might be done through the agency of agricultural societies?—They would undoubtedly help a good deal.

2852. Do you think it would be practicable to carry on such research or experimental stations as you allude to, through the Royal Agricultural Society?—Yes, my own opinion is that that is one of the things that they are most able to do, or that they might do with most benefit.

2853. Perhaps you are aware that at present most of these experimental stations or research stations are directly associated with agricultural colleges?—Yes.

2854. I can say from my own experience that I have frequently attempted to get local chambers of agriculture or farmers' clubs to take up part of this experimental work, and I have found great difficulty in getting them to do it.—Yes, that is quite true.

2855. Even when local pressure was brought to bear. Do you think a central body in London could secure that local interest which a man on the spot would fail to get?—I do not know that the consultative committee themselves could do it, but I think you might by means of the consultative committee arrive at finding out who the people are in a district to whom you might most successfully appeal.

2856. Provided there are people in the district. I know some districts very intimately where I am afraid I should fail to find them.—I think I may venture to say, by degrees the appreciation of the value of that sort of thing is growing in the country, and I think that through the agricultural societies the growth could be stimulated.

2857. You would rather, perhaps, see it developed through the agricultural societies than through the colleges. Is that your idea?—I would, because the societies involve constancy on the part of the members themselves. The people are resident in the district and if you could get their efforts directed to this channel I think it would come with a greater chance of appreciation. I do not know whether I have made myself clear.

2858. Yes, but personally I should be very much afraid that the effort would not last long.—I do not know at all.

2859. Many local agricultural societies have, as a matter of fact, started experimental stations?—Have they been helped?

2860. Yes, they have been helped, and they have dropped them. There is just one other part of your evidence that I want to refer you to. You said research was one thing and education was another. I suppose you were referring to lower-grade education. You would not make that observation with reference to the higher grades of education—the class of education that goes on say at universities and university colleges?—When a man has reached an advanced stage in the science which he is studying he may begin no doubt under guidance to set himself to research work, but he has got a long road to travel before he comes to that stage.

2861. I quite agree so far as the student is concerned, but what about the teacher?—I quite agree that teachers ought to be encouraged to carry on research, but I do not quite see how they could carry out their work in education and their work in research simultaneously. I do not say so positively, but I should have thought it would be difficult.

2862. Coming to your county of Devon, you found certain lectures were greatly appreciated, and certain were scouted, and that the lectures appreciated were horticulture, bee-keeping and poultry-keeping?—Yes, they were all of a very practical character.

2863. The other lectures of a scientific character were not so much appreciated?—Not so much—not generally.

2864. Because the men who were giving those lectures were not able to translate them into practice for the farmer?—Yes, I should say that is the truth of it.

2865. Do you think men would ever be able to teach farmers who were not themselves familiar with experimental work and farming both. Could you make use of an instructor who had not himself had experience in some form of research work?—I agree for the purpose of training the

instructor that research work is extremely valuable, absolutely. *Sir C.T. Dyke Acland.*

2866. And the failure of your instructors may have been because they had no experience?—I cannot speak of particular instances, but I think it is extremely likely it may be so. *May, 1907.*

2867. While you put forward research as one of the most important subjects with which we have to deal, you deprecate rather the experimental farm and the experimental station?—For the purposes of research, yes, because you could hardly get a practical farmer into a really scientific state of mind—I mean research depends upon exact science, does it not, on all the processes being carried out in an exactly scientific manner, and a farmer cannot be brought into that state of mind.

2868. What you mean is we cannot take an ordinary farm, and use it for the purposes of research; it must be controlled?—Yes, you must have a scientific man watching it.

2869. I did not quite understand what class of experimental farm you alluded to when you deprecated the experimental farm?—I deprecate demonstration and illustration being carried on at fixed stations. I think that it is much more valuable to arrange for their being carried on at different places in successive years. I think you get more for your money, so to speak. More people are interested in it, and you do not require, and certainly cannot get from the ordinary farmer, the scientific precision which makes experiment amount to research. You can get a principle which you well know beforehand fairly illustrated on any farm you choose to apply it to. I do not know whether I have made myself clear.

2870. Yes, I understand your point. You believe that demonstration plots should be moved about the country?—Yes, I think that is the most useful form.

2871. (*By Mr. Davies.*) I think you told us, Sir Thomas, that agriculture is almost the exclusive industry in your county. Is that so?—We have no great factories anywhere and agriculture is the chief thing no doubt.

2872. The majority of the people there are very much interested in agriculture?—I do not know that I should exactly say that. They are interested in the prosperity of agriculture in this sense, that nearly all the towns in Devonshire depend upon the prosperity of the agriculturists surrounding them.

2873. You also told the Committee, I think, that there is no agricultural college as a centre for the counties of Devon and Somerset and Cornwall?—Not at present, no.

2874. Your personal opinion, I gather from your replies to different questions is that you yourself are of opinion that there should be a centre of that kind?—I am in hopes that the Seale Hayne Bequest, when the institution is established, will be found to be of great value, but it all depends, of course, on the scheme and how it is carried out. We are in the dark with regard to that at present. I think there is plenty of room for research and that instruction can be carried on.

2875. The great drawback now is that the farmers will not appreciate it. That is the great reason why the County Council do not proceed with it I suppose?—No, I do not say that, I think they will appreciate it if it is properly carried out. What I said with reference to that subject a little while ago was only intended to convey this: that we were not prepared for, and we did not think that there was a *bona fide* demand for an agricultural college some years ago sufficient to justify us in spending the large amount of money that would have been required to establish one. We thought that our expenditure of the grants given to us might be more wisely carried out in another direction.

2876. Do you think that it is a good thing to have an agricultural department in connection with a university college—that there are any advantages in being in close touch with a university college?—I hardly know how to answer that, because I do not believe that you can teach farming at an institution. You can teach them agricultural processes, but I do not think you will make a college farm succeed as a farm. At the college, however, you can certainly teach them things that would be of very great value to them in the practice of agriculture.

2877. At Leeds, Bangor, Aberystwyth, and some of the other colleges there are agricultural departments directly in conjunction with the other work of the college?—Yes.

2878. More or less apart from the ordinary curriculum of the college?—I do not know a bit, and I should like

Sir C.T. Dyke
Acland.

9 May, 1907.

to know whether the balance sheets of those farms can be regarded as satisfactory. It may be that they do show a satisfactory balance sheet, but if that is so I should be surprised. If the bailiff of the farm can produce a satisfactory balance sheet and show that the institution is richer for having a farm, it might be regarded as satisfactory evidence, but I should doubt it.

2879. I am afraid I have not made myself clear. What I want to know is whether to take Bristol, for instance, which I believe is a university college, and which students from your particular county attend?—I do not know that they do, but they may.

2880. It is the only college near you, is it not?—Yes.

2881. Whether it would not be thought at all possible to have an agricultural department in connection with the college there?—You mean to say by the agricultural department, a department devoted to teaching science as applicable to agriculture.

2882. Yes?—I do not see any reason why they should not.

2883. Do you think the County Council would be prepared to give you a grant for that purpose?—Our County Council?

2884. Yes.—I would not speak positively to that, but supposing they were to give us scholarships, I think possibly we might send some students there on terms to be arranged.

2885. Is dearth of students due at all to the lack of secondary schools in the counties of Cornwall, Devonshire, and Somerset?—I am glad you have asked me that question, because I think it is quite possible that it is. I think, if the condition of our secondary education in Devon were better, that it is quite possible that the boys themselves who have been through secondary schools would be intelligent, and would persuade their fathers to let them go and carry on their work a little further at these institutions.

2886. Some of the witnesses have told us that the type of student who came up, especially to the short courses that have been held at the agricultural departments connected with these various colleges, was not fit to receive the instruction that was provided for them, especially in the chemistry.—That, I should think, was extremely likely.

2887. That seems to have been due to the lack of secondary schools and education; and when you told the Committee that the farmers would not take advantage of the college, even if an agricultural college was provided for them—?—Did I say that?

2888. I understand you to say so?—I said I was not sanguine about it; I am doubtful at present.

2889. Whether that was due to the fact that the sons of the farmers were not sufficiently qualified even to receive simple agricultural education at a college?—I think that would be true of a very large number of them, certainly I know in the case of a great many farmers' sons—men who, come to me for farms when I have had farms to let—I frequently find that they have not been to anything but an elementary school; but I do think this, that when the endowed schools have gone to work, progress has been made with the farmers' sons, and I look forward, under the Act of 1902, to a very considerable advantage coming to the farmer in respect of secondary education, and I hope, when the farmers have the schools accessible to them, there will be many more boys fitted for availing themselves of an agricultural college.

2890. I think you told the Committee that you deprecated any sort of special instruction in agriculture in these secondary schools?—Yes; I deprecate devoting any part of the teaching at secondary schools to specialising in farming.

2891. You would not object to having a special course in science in contrast to the classical side of a secondary school, would you, because our experience has been, that, supposing a farmer sends his son to a secondary school for two or three years, and he is taught Latin and French, and so on, and little attention is paid to chemistry and botany, and he goes straight back to the farm and he simply forgets all he has learnt in a year or two, and is not much better for having gone at all?—I think the curriculum in a secondary school in which science did not form a part of it would be very deficient. I think our object in providing secondary schools for the people in Devonshire—we are now trying to provide five—our object will be to educate the sons of the people in the neighbourhood who are going in for other kinds of business besides farming. We cannot devote ourselves more to the business of farming for farmers' sons than to any other kind of business into which these lads may be intending to go. We must fit them as widely as we can

for their different careers in life; and, therefore for the good of the school as well as for the good of the boy, specialising must be deferred to the last possible moment. I think that the general education at secondary schools ought to be kept as liberal and wide as possible, and that special education for farmers' sons or others should be conducted chiefly at some other school. I am quite in favour of a wide education. I do not want at all to see the education in secondary schools confined to classics, and French, and languages, and so on; science must have its place; only not agricultural science.

2892. In connection with the Journal of the Bath and West, what organisation have you for the distribution?—It is distributed to all the members of the Society.

2893. But not to other farmers?—No; the institutions get it.

2894. It does not come within the reach of the smaller farmers?—Members of the Society get the Journal; and as I explained, we occasionally, when we are asked, take one particular subject in any particular year that may be desired, and reprint one and sell it or distribute it gratis to people who ask for it.

2895. I think you said two sets of experiments are carried on in your county, one set by the agricultural committee of the County Council and the other set by the Bath and West?—Yes; that is true to a certain extent. There is, in Devonshire, one of the manure and mutton experiments being carried on by the Bath and West Society, and the County Council have their own experiments being carried on independently from that by their own instructor.

2896. No attempt is made to co-ordinate the results?—No, no attempt is made at all; they have nothing to do with each other.

2897. Is the dairying industry as flourishing now as it ever has been in Devonshire? I understand that you have no travelling dairy school there now?—In Devonshire we have had a travelling dairy school for several years—I do not quite remember how many, but nearly twenty I should think—and the demand seems to increase rather than to diminish, and it is bespoken now for twelve months ahead. It gives a course of about three weeks in each place, and then it moves on to another place; and, as I have said, its work is bespoken very far ahead.

2898. (By Mr. Latham.) You are very anxious about these agricultural societies carrying on research?—Not research, experiment.

2899. I have no doubt a very strong reason for you wishing that they should do it is in consequence of their being all over the country. They visit the different towns all over the country, and in consequence of that you think it very desirable that they should be induced to do it?—Yes; I think it would be a good thing if they could be induced to do it.

2900. Mr Middleton said it was tried and it was found to be hopeless; but I do not know a single county where it has been tried.

Professor Middleton: Norfolk has had experiments in connection with the Chamber of Agriculture.

2901. (By Mr. Latham.) The Chamber of Agriculture is not a real agricultural society. You have a very large number of societies that are scattered all over the country.—Yes; that is my point.

2902. (By the Chairman.) You have stated that in the present stage of development you do not believe that you can induce any great number of farmers to send their sons to these colleges in the west of England. What I want to ask you, is the curriculum which you would prescribe for the son of a land-owner, say to fill a position offered by an owner to whom expense was no object, and whose object was to obtain a man of the utmost efficiency with regard to estate management; I want to know what is the kind of education which such an individual, according to you, should have. I take it you would send him to the best secondary school you could find, and give him the best education you could. You would give him science, and you would not give him classics?—Yes, I should give him classics to begin with.

2903. I want to find out what you consider necessary. Do you consider a knowledge of classics would be necessary to him in the management of an estate. Of course, it would be of the greatest use to him in other ways?—Put in that way, I do not think it would be much use to him in the management of an estate, but the process of learning them would have been of very great use to him.

2904. Supposing he had sufficient time, you would not

object to sending him to the modern side of a secondary school?—No.

2905. Having done that he leaves the modern side of the secondary school, and where would you send him next. Would you send him then to a university for a course of pure science, or would you send him to the agricultural department of a university college?—When he leaves the secondary school?

2906. Yes?—I think it would be very wise to give him a year or two of pure science; I do think that, certainly.

2907. A general education given at the university?—Yes.

2908. And then finally this specific agricultural education of the highest class?—Yes, when he has learnt thoroughly to appreciate science.

2909. That applies to landowners, land agents, and all that class who have the means of becoming agricultural experts?—Yes, who have the means of carrying on their education up to 21 or 22 years of age.

2910. You are in favour of a specialisation coming quite at the end, the later the better, and the more general education he could get at the end also the better?—Yes.

2911. Now I want to have your opinion stated quite clearly on the question of research and experimental farms. You would not object to an experimental farm conducted independently of an educational institution?—Not at all.

2912. You would, wherever you could, have an experimental farm and give encouragement to counties or societies to start such a farm?—Yes, I think the societies ought to start them; I wish to see it done.

2913. You would have no objection to having the research station which you favour in connection with that farm?—I would have the research station connected with the education centre; I am quite ready to see that. If you start a college for a group of counties or a county I would certainly have alongside of that college a research station.

2914. You would not have connected with that college a farm?—Not a farm—certainly not.

2915. A research station with a college?—Yes.

2916. Where there is no college, as there is not in the West of England, you would have a research station independently?—Yes, research independently.

2917. And that research started under the auspices of some society, but encouraged by the Board of Agriculture by a very generous grant?—Yes, coupled with careful inspection.

2918. Of course; you would not exclude from that research station original research?—No, I wish to have original research.

2919. I ask you because in the examination of Mr.

Acland, he put a question to you about educational research, and original research?—Yes.

2920. I, personally, do not quite see how you can separate the two, but in any case you would not limit that research to what is called educational research; you would allow original research to be done there?—I think original research ought to be carried on there.

2921. The next point is that you are in favour of demonstrations, only that the demonstrations should not be stationary but should be migratory?—Yes.

2922. My only object is to make quite clear what your own view is; not what my view is. I hope that summarises your ideas on the subject?—Yes, I certainly think so. I do not for one moment say that at a particular place where you have people gathered together you should not have a series of different kinds of demonstrations. I think you should. The more illustration you may have in connection with your educational institution the better. I only mean to say that for the purpose of the farmers, the stationary demonstration plot is of very little use.

2923. (*By Lord Barnard.*) I only want to ask one question with regard to the Board of Agriculture literature, to which I think you referred. Is it largely distributed amongst the farmers in the county?—It is to a considerable extent. I do not know by what machinery. I myself did distribute for some years a very liberal supply that was sent to me among my own tenants. I sent it round, and since then the Board have been liberal enough to undertake the distribution itself. How much they send out I do not know, but I do know that a great many farmers I come across, from time to time, do not know about these leaflets.

2924. Those who do get them appreciate them and value them?—They do, I carry them with me about my farms, and when my tenants have them, they are in the habit of quoting them to me and asking me questions about them.

2925. You think that anything that would tend to the further circulation of them would be of advantage?—Yes, and as I said before, I think if they were distributed to all the village post offices throughout the country, and that was made known, that would be the best way of doing it.

2926. Are you aware that certain agricultural colleges issue and circulate bulletins also?—I did not know that, but I should be in favour of that. I should like to see any amount of intelligible literature circulated. I am bound to say that some of these leaflets have been a little above the ordinary average intelligence of those who are intended to read them. I think that that is a criticism that one may fairly make without saying anything against the Board of Agriculture. Perhaps I ought not to have instanced that, but I have very often heard it said, and as it is very often said, I thought it better to communicate it to you.

*Sir C. T. Dyke
Acland.*

9 May, 1907.

Mr. JOHN BICKERSTETH, called and examined.

2927. (*By the Chairman.*) You are one of the joint clerks of the Yorkshire Council for Agricultural Education?—Yes.

2928. You have been clerk of the East Riding County Council since its institution, and of the Technical Instruction Committee appointed by that body in 1891?—Yes, that is so.

2929. I understand that shortly after the Customs and Excise money was given to County Councils a scheme was drawn up by the authorities of the Yorkshire College, providing that the agricultural work should be carried on by lecturers, who should work throughout the three Ridings under the superintendence of the Professor of agriculture?—Yes; the scheme was submitted to the three County Councils, and was practically adopted by all three authorities. The scheme suggested that the agricultural education work of the three Ridings should be conducted on identical lines, under the authority and through the agency of the Yorkshire College, which was then, as your Lordship may remember, a part of the Victoria University, including the College of Liverpool, Owens College, Manchester, and the Yorkshire College at Leeds. That scheme mainly provided for peripatetic lectures by lecturers who should act under the superintendence of the Professor of Agriculture. The department of agriculture in the College

was established about this time, with a chair of agriculture. A Professor of Agriculture was appointed either at that time or a few months previously. The agricultural department was then supported partly from the general funds of the University and partly by subscriptions, which were, I think, got up among the great landowners of Yorkshire for the purposes of establishing a chair of agriculture at their provincial college. I can speak more especially for the East Riding, as it was one of the three partners; but the scheme was adopted by all the three County Councils. Representatives of these Councils were placed upon the agricultural committee of the College, and, subject to the nominal control of the County Council Technical Instruction Committees (who were asked to approve all centres where lectures were to be given), the work was organised and carried on by the agricultural department of the College. I think it was felt that by adopting the scheme drawn up by the college, the parties were able at the very first to insure that the character of the instruction given should be of the highest class. We were able to attract to the work men, as lecturers, who were more willing to act under the *aegis* of the college or university than if they had merely been the paid lecturers of individual County Councils. I remember it was pointed out to us that by the adoption of a joint scheme we should get not only better lecturers, but that each County Council, instead of confining its

*Mr. J.
Bickers'eth.*

Mr. J.
Bickersteth.
9 May, 1907.

missionary efforts to a single lecturer, would have the advantage jointly of the services of three lecturers appointed at the very first. That number was afterwards increased. It was felt also, that instead of the lecturers' work being submitted to what would have been after all a lay committee of the County Council, it could be insured that the work should be supervised by the Professor of Agriculture at the College. I have said that the work mainly consisted of peripatetic lectures, but there was also started at the College a ten weeks' course for farmers' sons. That experiment was to a certain extent successful, but it was found that the ten weeks' course was rather too short, and I believe that at the present time we have no ten weeks' courses, although we have winter courses, to fit their convenience when farmers' sons can be best spared from the farm. We also established at that time a travelling dairy—a properly equipped dairy, which was taken round the country, and stopped at various places for a fortnight or three weeks, whilst the dairymaids of the district came to the classes. There were also started at that time Saturday classes for teachers in elementary schools. These last-mentioned classes lasted for two or three years. They were very well attended by the teachers, and we were so anxious to get them to come that we were liberal in paying their expenses. They came, but we did not find that the classes were really a very great advantage for the work we thought we had to carry on. The fact is, we were learning our own work, because we were a young educational body, and we thought it desirable to start lectures or classes for the teachers of elementary schools which might enable them to teach similar subjects in their schools. But at that time we had no control or special interest in elementary schools, and we found often that the country managers took no interest in our work. There was a perhaps natural prejudice at that time against the introduction of fresh extra subjects into the curriculum. They said they already had enough, and we feared the lectures did not at once do much good, but we hope and believe that the expenditure of money upon them was not altogether wasted, because some of the object lessons given in the classes on agriculture were no doubt afterwards of some advantage to the teachers in their schools.

2930. Were the peripatetic lectures well attended?—Yes; very well attended. Professor Seton has a list which we have prepared of the number of peripatetic lectures we have given up to the present time, and, roughly speaking, I take the number as about 4,500.

2931. Can you state the subjects on which lectures were given?—I would rather leave Professor Seton to answer these details. We publish every year a statement of the courses. They cover a wide range of agricultural subjects, but these subjects depend to some extent upon the individual taste of the local committees or the capacity of the lecturers whom we happen to have available.

2932. Is the winter course well attended?—Not so well attended as we should like. I think that this year we have something like 50 students attending it. We do our best to encourage the farmers to send their sons, but there is some disinclination to let them go from the farm. We are beginning our work, and have not yet got to the full fruition of our hopes; but we hope that some day farmers will send their sons more readily. Their fees are found by the county, and we also pay them a maintenance allowance of some 15s. per week. We have a sub-committee who go carefully into the applications for these scholarships, or bursaries, or exhibitions, or whatever you like to call them, and we endeavour to satisfy ourselves that the most suitable are selected—those most fitted to learn what the University has got to teach them, so far as it can teach them anything in such a short time. I understand that about 75 per cent. of them return to farming, although some go away perhaps to Egypt or the Argentine.

2933. You think the work will be more and more valued by the farmers?—I am sure it will. In Yorkshire we believe that if you are to do anything to benefit the industry of agriculture you must interest the captains of that industry. We began our work 15 years ago. It was found that there was a considerable suspicion on the part of those engaged in the industry of farming. They were rather inclined at first to resent the idea that a scientific man had anything to teach them. The farmers thought that they knew more than any professor about their business. We have since come much into contact with the farmers, not only by means of the peripatetic lectures but by other extensions of our work in the way of demonstration plots, &c. In the autumn of 1887 the Garforth farm was taken on lease by a joint committee of the East and West Riding County Councils, and a good deal of experimental work is carried on there. The place is visited in summer by farmers

in parties of sometimes 40 to 50, some of whom have to come a long way, and they are apparently much interested in the experimental work as to the fertilising effects of manures, &c. We have at Garforth a place where we carry on experiments both in crops and stock, undertaken for the benefit of agriculture generally, and we have under the skilled supervision of the University staff a number of plots throughout the county, where some of the experiments and demonstrations arranged at Garforth are duplicated under various conditions. The people engaged in farming in these districts now come to the Professor with great readiness to seek his counsel or guidance upon various points. We try to bring the workers of the district into touch with the Professor, who is approaching the same subjects from perhaps a more scientific point of view. I have always thought that people could not understand what technical instruction could be until they realised that there are two distinct lines upon which a municipality ought to act. There is on the one hand the scientific worker, who is not working exactly with a view to direct and immediate money profit, but in order to find out what are the secrets and laws of nature bearing upon a particular industry. We want to encourage the best available intelligence to be brought to bear upon the pure science of any particular industry. This would apply to soap boiling or any other industry as much as to agriculture. On the other hand we have to consider the interests of general education. We want to enlarge the general intelligence of the students in order that they may be educated to accept and appreciate the conclusions of trained observers. We want the two classes—that is, the class engaged in scientific work and the class engaged in commercial work—to shake hands at the top and all the way up. That gives the worker more interest in his work. We have taught many farmers who did not believe they had anything to learn to come to the experts and seek useful practical help, which is readily given. We sometimes acquire the services of men who will occasionally want to go in for a little research as distinguished from ordinary experiments, and it would be an advantage if we could persuade this Committee to help us to get a little more money for such work. We also want more money for our experimental work, and to complete our educational work; but in conjunction with the Board of Agriculture we occasionally come across problems which it is most important to solve, although probably we cannot show that the solving of them would necessarily result in an immediate saving to the ratepayers. There come in considerations not of the municipality but of the nation, which we want to help us in such work. We have done a great deal to remove the prejudices of the farming community against scientific work, but having brought the matter up to this point we want a little more money.

2934. You think that the way in which the Board of Agriculture could best help your work would be in the direction of research?—Well, I am afraid that in my anxiety not to forget research, I may have given a somewhat wrong impression. So far as educational efficiency goes we have very nearly reached the end of our resources. The North Riding County Council includes, in addition to an agricultural part, the great rich district of Cleveland, and the West Riding, as we all know, has wealth which comes from successful manufacture and successful mining. In the East Riding, however, we are only a poor agricultural county, and I am amazed at the liberality of the farmers in my County Council in their willingness to give money for the purposes of higher education. When we began work we were comparatively rich, because the "whisky money" was not drawn out of the rates, and we were liberal. We paid our share in keeping up these farm buildings, we resolved from the first that our work should be good, and we paid proportionately for it. But now even our educational work will suffer unless we have some more help. We have been spending in the whole of Yorkshire something like £8,000 a year on the agricultural department of the University, and the Board of Agriculture has contributed £800 as well as £200 for experimental work. That is only about one-eighth of the whole, and I think our work is of sufficient national importance to justify us in asking the Treasury for a little more. The research work is, of course, indefinite in amount, but I would like to be able to go on with it. As our work develops the interest which the farmers take in it shows a tendency to increase. There are now many places where they would be perfectly willing to have a demonstration plot or experiments on grass land or the like. Plenty of farmers are sufficiently interested to lend the necessary land, and even to give the labour. The seeds and the manure would cost very little. What does cost, and what must be paid for if the character of the work be maintained at a high level, is the service of a competent person to supervise. We have one member of our

Mr. J.
Bickersteth.
—
9 May, 1907.

staff, Mr. Stewart, whose business it is (acting under Prof. Seton) to visit and inspect these plots. Every plot is, to a certain extent, a scientific experiment. We should not be doing good work if we simply left it to the people and said, "Now carry out the instructions." The instructions must be carried out under the supervision of a trained and competent scientific assistant to our Professor. I should say that our staff are now worked to the limits of human endurance, and we should like to know that we could afford to carry out extensions. Apart from any question of research, we would like your Committee to take into account that our educational resources are not what they were. Parliament has been good enough to say that the technical instruction money is now to be used for higher education. We welcome that change and extension, but I am sorry to say that a result of the Act of 1902 was to charge upon the higher education work a great deal that really belongs to elementary education, such as the training of pupil-teachers; so that really our higher education funds are diminishing. In my own county we have rated ourselves for higher education, but much of what Parliament intended us to spend on higher education is really spent necessarily on work which—although technically higher education, from the point of view of the auditor—really appertains properly to the domain of elementary education. I mention that as a reason for asking that our higher educational work should also be helped, apart from the absolute duty that lies upon the nation to help us in research work.

2935. What is the amount of the rate?—The amount of the rate is a penny in the pound, but that means a great deal in an agricultural district. Supposing a man is earning £1,000 a year in the East Riding by professional or similar work, he pays very much less upon a penny rate than the farmer, because of the difference in his assessment. Every politician knows that the anomalies in the incidence of rating is a subject that ought to be dealt with, but it is not a subject, perhaps, that very deeply interests the general public. We don't desire to enter into the academic discussion as to whether or not the ultimate burden falls on the landlord or tenant, but speaking as the official adviser and friend of one of the councils I know that if I ask them for another penny rate the agricultural member says: "That means another £5 out of my pocket," whereas in the case of persons in a town earning as much, but assessed much lower on account of their moderate rental, the penny rate would in comparison represent only a few shillings. A penny rate in agricultural districts for higher education may mean that a farmer has to pay from four to six pounds or eight pounds extra. The Royal Commission came to a conclusion on the subject five years ago, but it has been pigeon-holed ever since.

2936. Your county rate for higher education is 1d. ?—Yes.

2937. What is it in the West Riding?—I do not know the West Riding rate. I think in the North Riding they, for some time, refused to levy a rate at all. In the East Riding we have persuaded two of our boroughs to levy a penny rate for higher education upon condition that the County Council established secondary schools in these boroughs. That has been done, but the county as a whole is responsible for higher education.

2938. Is the provision of secondary schools adequate in the three Ridings?—The policy in the three Ridings is not identical. I can tell you what it is in my own Riding, and I have a rough idea of what it is in the other two. Speaking broadly, all three Ridings are doing their best to encourage and secure the suitability and efficiency of existing secondary schools. In my own county we have founded two or three secondary schools, and it is an expensive business if you have a high standard. It may be germane to this enquiry to mention that we have scholarships to these secondary schools. If one were asked to trace one's ideal of the progress of a farmer's boy, I should say that he would get a scholarship from the elementary school to a secondary school, and after he leaves the secondary school we should like him to go back to the farm for a year or two. Then, armed with a good general education and a knowledge of the manual parts of farming, he would come to Leeds and be there instructed, in connection with the University, in the principles which underlie agriculture. We discourage any attempts to teach agriculture in the secondary schools. Our professors and lecturers tell us that they would rather have a pupil well trained in general intelligence than one who has learned a little agriculture in a secondary school. It could be nothing more than a smattering of specialisation that could be given in a secondary school, and that would interfere with and

hinder rather than promote the valuable instruction which the student might get in the University course. It is possible that in Yorkshire we may have come to a different conclusion on that matter from some other places. One hears of some encouragement of the idea that agriculture should be taught in secondary schools, or that secondary schools should be founded in agricultural districts, with an agricultural side. From what I have been told by our professors and lecturers, they would rather that was not done. They would rather have a boy who had learned a little mathematics, or who was able to take notes and understand the lectures, than one who had picked up a smattering of so-called agricultural knowledge at a secondary school.

2939. Do the farmers send their sons to the secondary schools?—I wish they would do so more commonly. I think some of them do so. Certainly some of the best of them do so, and we are doing all we can, even in the thinly-populated agricultural districts, to make it possible for farmers' sons to go to secondary schools. I am sorry to say that our standard for examination for scholarships is not so high as I should like it to be; there is little or no difficulty in the way of boys from an elementary school getting an entrance scholarship to a secondary school. The reason which would prevent the farmer from sending his sons is not, in Yorkshire, the want of money. In the North Riding and certainly in the West Riding, as well as in the East Riding, it is quite possible for the fees to be found if the circumstances of the parents are poor. Some kind of bursary can be got for maintenance. The difficulty is not the fee which has to be paid, but that the poor man likes to have the advantage of his son's labour. Oddly enough, so far as one is able to judge, the applications for scholarships seem to come rather more readily and frequently from the Dale farmers in the North Riding than from the larger and richer farmers in the East Riding. Some of the men who have little more than small holdings appear to be more anxious to get these scholarships for their sons than the better-off farmers, but I do not want our work to be judged at present from the number of pupils we get; I believe we are on the right lines and I am sure that one day the farmers will send their sons more readily than they do now, and those whom we now turn out will in due time send their sons. The education of a whole district is not to be changed in a day, or in a year, or perhaps even in 10 years. It is a gradual process. We have convinced the farmers that we have something to teach and that it is good for their sons to come and take lessons. I believe they will come in greater numbers in the future.

2940. You stated, I think, that in 1897 the Garforth Farm was leased by a Joint Committee of the East and West County Councils, is that still going on?—Yes.

2941. Is the farm attached to the College?—Yes.

2942. Is it managed by the University?—Yes. But the University does not, as in the case of its leather industry and engineering departments, appoint a departmental committee to manage the agricultural branch, they recognise the Joint Agricultural Council which represents the County Councils as a committee of the University. The University acting in complete harmony with the County Councils allows the committee of these councils to act as its committee for the regulation of all matters which the University has ultimately to deal with. If there was a vacancy in a lectureship to-morrow we should advertise it and recommend a man to the Council of the University who would appoint him. The union between the University work and the County Council work is in this particular complete. I called myself one of the joint clerks of the Yorkshire Council for Agricultural Education, my colleagues are the two gentlemen who represent and direct the education in the North and West Ridings respectively.

2943. What is the size of the farm, and what are the operations conducted there?—When Professor Seton gives evidence he can tell you better about that, but, roughly speaking, the farm is about 300 acres in extent and about half of it is grass.

2944. I suppose the scope of the work has developed since the farm was taken?—Yes, enormously. Speaking with some pride as one who has taken part in it from the beginning, I may say that it has co-ordinated the system. We have a university department where students can take up the study of agriculture for a degree, and we have got scholarships which afford a ladder from the elementary schools to the University. A certain number of the entrance scholarships are confined to children coming from elementary schools. We hope by means of Saturday classes for teachers and the educational gardens that the

Mr. J.
Bickersteth.
9 May, 1907.

University staff, and the teachers in the elementary schools will be gradually brought into closer relationship. Our training helps to fit teachers to encourage intelligent nature study in their schools. Our work has increased. We have made it possible for farmers' sons to come to Leeds for a winter session, and we think that two consecutive winter sessions together with attendance at one summer term give such a training as is eminently desirable for one about to take up farming. With a third winter course a young man ought to be able to obtain the National Diploma in Agriculture. I have explained that at Garforth we have a place where we can carry on experiments both in crops and stock. The number of extension lectures is limited by the number of our staff. The demand for these lectures is fully maintained and the interest taken in them has increased.

2945. You give a science degree in agriculture?—Yes. That was not so when we began, but with the co-operation of our friends at Leeds we got the Victoria University to do it and it has since been continued by the Leeds University. Agriculture is a recognised subject for a science degree.

2946. Has that been taken by farmers' sons?—Yes, I think so.

2947. Do the University staff carry out the experiments you mentioned?—Yes.

2948. Are these experiments carried out at the farm or in the Ridings?—Both. Some of those carried out in different parts of the county are duplicates of experiments made at Garforth. We selected Garforth because it was near Leeds but, of course, there are some desirable experiments not suited to that particular soil.

2949. The lectures are on the results of these experiments?—Yes. I think that at one time the subjects of the lectures depended upon a list made by each lecturer, but now we have given the lecturers instructions to treat the plots as their text for all their lectures.

2950. Are these lectures well attended by farmers?—Yes, they are very well attended by farmers. There is practically no diminution in the numbers who attend. I hand in a table showing the number. It appears that last year's average was 32 attendances for agriculture, 40 average attendances for horticultural work, and 54 for butter-making. I hear much less than I used to hear when we began to the effect that these lectures are attended by people attracted by the charm of the lecturer more than for their interest in the particular subject. If the composition of the audiences now and previously could be analysed it would be found that there was now a larger percentage of persons attending who are really in a genuine way interested in farming. Both the numbers and the quality keep up, indeed the quality improves.

2951. Have you centres for teaching fruit culture?—Yes, at Garforth we have a garden where experiments are carried on in bush fruit and grafting. Teachers learn a little about these things when they go, and we have a demonstrator for that sort of work who starts little centres in places where he has reason to believe the people will be interested. I remember one place in point—a place where they had allotments and grew apples, and where a successful course of lectures was well attended for eight or ten consecutive weeks.

2952. Have you any farriery instruction?—Yes, we have a farriery instructor who gives lectures and demonstrations of a practical character. He lectures in villages, and in addition has done some good work by going to places where members of our committee introduce him where he can see the smiths at their work. He makes a missionary tour amongst them, and some of these expeditions have resulted in a satisfactory course of lectures being arranged.

2953. Are there special agricultural exhibitions given by the three councils?—Yes; tenable at the winter and summer courses. I think all three Ridings give besides these university scholarships. That is the top of our ladder. We have in Yorkshire large farmers and small farmers, and the Council have done their best to make the course suitable for all classes. If our ordinary list was filled up, and the son of a farmer was to appear with special qualifications, we could give him a special scholarship to go to the University.

2954. You are of opinion that the work of an institution must not be judged altogether by the number or type or after history of student?—I do think that is most important. I should regard with dismay any proposal to judge our work by the number of persons who at a particular time attend any particular course. The contact of our scientific men with the actual workers in the industry of agri-

culture is of provincial and indeed national importance, and ought to be encouraged apart from counting heads. I wish we could get more young farmers to come to us. When we began we thought we should be doing fairly well if we got ten, but now we have 50, and we hope for many more. The Council have always felt that they were working for the industry of agriculture, and that their work will be justified if they can induce those who are engaged in that industry as a commercial enterprise to adopt the method which the best opinion of men of science who give their attention to the matter, suggest as being in the long run the most profitable.

2955. Have you a dairy school at the farm?—Yes. We keep a herd of cows, and have a dairy school with an instructress. We give scholarships for short courses. Lord Belper, who is a member of your Committee, is aware that we have a friendly agreement with the Midland Dairy Institute that we at Garforth will not carry on dairy students quite so far as that institution carries them on. At Kegworth they have a dairy school proper, and they make cheeses, whereas we do not. Upon several occasions during the time that this friendly agreement has lasted we have sent advanced dairy students to the Midland Dairy Institute, and I believe they have reciprocated by sending agricultural students to Leeds. We send our dairy instructress into the country on occasional peripatetic work. We use our own discretion as to that. If we think that the people in a certain district ought to come and do not, we may send her there, and a few visits do good.

2956. Would you be in favour of a scheme being drawn up annually for the county showing the whole agricultural education work in the county, and that this should be submitted to the Board of Agriculture, so that grants might be made in proportion to the work done?—I should approve of that. We have the advantage of the frequent visits of the inspectors of the Board of Agriculture, and it seems to me that it would be quite simple to arrange that our scheme for the whole year should be submitted to the Board. If the Board of Agriculture could suggest any improvements or alterations we should welcome them.

2957. Do you think that such a scheme should be drawn up for every county in England?—I have rather a terror of uniformity.

2958. I don't mean that the schemes should be identical, but that their character should be initiated by the local authority in accordance with the wants of its own locality?—Yes, that is our view in Yorkshire, but we have there an enormous advantage, which makes us unique, through the connection with the Leeds University. That institution is rather anxious to extend its sphere of usefulness, and it has helped us in every way, and we have helped it so far as we could. The connection between the university and the county is we think an ideal one.

2959. Do you think it would be desirable to have a consultative committee in London, in which representatives of the agricultural interest throughout the country should be sent?—I think that would be a very good plan.

2960. In order to co-ordinate the various results throughout the country?—Yes. If such a committee is formed I should like it to have a little command of money. There are things which occur to us in our daily work that need money, which the ratepayers can hardly be expected to give. If you had a consultative committee, a strong committee, there might be upon it men who could judge, and advise whether such a sum as £500 should be allowed for the carrying out of important practical experiments suggested by such a body as the Yorkshire Agricultural Council. I may mention that at Leeds we are now engaged in a special investigation. The farmers of Yorkshire are rather annoyed at the inclination which the towns have shown to say that all the pollution in milk comes from the shocking state in which the farmers keep their homesteads. We in the country think that some of the towns do not keep the milk quite as it ought to be treated from the time it is delivered at a railway station to the time it is consumed, perhaps by poor children in the slums. I wanted my Committee to undertake an inquiry on the subject, but they had not got any money for the purpose. I managed, however, to persuade the Sanitary Authorities of two Ridings—the North Riding backed out of it, but Sheffield, Leeds, Bradford, Hull and Rotherham contributed—to plank down £500, so we employed a trained bacteriologist, shut him up in a room at Garforth, and told him we should send him samples of milk as it left the farm, as it was found in transit, as it was offered for sale in a shop, and as it reached the consumer's hands. That means six or seven samples of the same consignment of milk. The

Board of Agriculture blessed us, but neither it nor the Local Government Board could find us any money. That is an illustration of how matters come up now and then for which we should like money assistance if it could be made available.

(By Mr. Latham.) We want the same kind of inquiry not only in your county, but all over England.

2961. (By the Chairman.) I understand that the average annual expenditure of the council for some years past has been about £8,500?—Yes.

2962. Towards which the national contribution has been £800 to the University and £200 for practical work at the farm?—Yes.

2963. Then you have spent out of the rates more than £5,000 in the erection and equipment of buildings, and on other improvements, and have also stocked the farm at a cost of £3,700?—Yes. That is quite independent of the University equipment of which our students share the benefit.

2964. What are the results of the farm? Are they satisfactory?—If any eminent person could tell us how to state or estimate the item "value of experimental work," we should be glad to know how to do it. Some people would say we were farming at a loss, but it is not, as a matter of fact, a big loss, perhaps not more than £400 or £500 a year.

2965. You think that the grant of £200 per annum by the Board of Agriculture for experimental work is altogether inadequate?—Yes. And I should like more added also to the £800 given to the University.

2966. I suppose the result of your 15 years' work has been to bring into more immediate relation the purely scientific man and the practical workers in the farming industry?—Yes.

2967. Of course you value the reciprocal influence of the one on the other?—Yes.

2968. The scientific man has something to learn from those whom you have called the captains in the industry of farming?—Yes, it is important to both that each should learn something from the other. Our Professor and his staff have instructions to let no opportunity pass of meeting farmers and discussing with them any questions of a possible improvement in their methods.

2969. I understood you to say that throughout the summer farmers come to your farm and there follow the work and the experiments in progress?—Yes.

2970. Increasing numbers?—Yes. It seems easier every year to get farmers who are willing to lend plots of land for demonstration purposes.

2971. You find that the small farmers are just as anxious as the large farmers to obtain education for their sons?—Sometimes rather more so. The Committee have to interview the applicants for scholarships or exhibitions, and they find they get rather more applications from the small North Riding farmers than from the larger farmers in the East or West Riding.

2972. Are the lectures ever attended by labourers?—I don't know. In the districts I am most acquainted with the population is so scattered that the farmers often have to drive in to the little country towns. I should say the labourers do not usually attend. The lectures are delivered to the farmers.

2973. Is there any instruction given in thatching or other processes for labourers?—No.

2974. Then you have not taken the labourers into account?—In every parish there is a good school where they can learn a great deal.

2975. (By Lord Barnard.) Can you tell us something more about the constitution of your managing committee? Does it contain representatives of the County Councils of the three Ridings in equal proportion?—I think so.

2976. Does it include any other members?—Yes. It includes 12 members from each of the three Ridings and 12 co-opted members, one of whom must be a woman.

2977. Is the committee well attended?—Yes. It divides its work. The principal committee meets four times a year, but there are, besides, sub-committees. There is an administrative Committee, a Farm Committee, and an Accounts Committee. The latter deals only with finance. The Farm Committee meets every month, and its members, who attend well, are in constant touch with the farmers and with the professors. I should think we have on it about ten or a dozen men who are practical farmers—men engaged in farming.

2978. What would you say to a suggestion that the Board of Agriculture should have a representative on your committee?—We should be glad of that.

2979. You think it would be a good thing?—Oh, yes.

2980. With regard to the course of education, I understood you to say you considered it desirable that a lad should have a year's practical work on the farm after leaving school and before he goes to the University; or the other hand it has also been suggested to us that in that year young lads are very apt to forget a great many of their school subjects, particularly mathematics, and have to spend a certain time in getting up these subjects again?—I should think that if a man was going in for a university degree it would be better for him to keep on at the school for another two years and pick up the manual part of farming during his holidays. In order to meet the difficulty as to mathematics we have engaged a tutor who keeps on coaching the lads.

2981. But that is a difficulty not easy to get over?—It is difficult.

2982. I rather infer from some of your answers that you think it is not, as a rule, the habit of farmers in Yorkshire to send their sons to secondary schools, but surely some of them do so?—The big farmers nearly all do so.

2983. But the Dale farmers do not?—I do not think they do so much.

2984. As to what you said about rates, I understood you to indicate that the present system of rating is a bar to the expenditure of more money upon higher instruction in agriculture because it presses so heavily on the agricultural class?—Yes, it is onerous in agricultural counties. If you want a new rate you have to ask a body who are very much, and to an undue extent, personally interested in the incidence of the rate. If you were to propose in the House of Commons a threepenny income tax for some educational purpose a great many persons would object but that is like the position we are in, because the farmer feel their pockets seriously touched.

2985. In suggesting it is almost essential that any further funds for the development of higher technical instruction must come from the Government you, no doubt took into consideration the fact that it cannot be expected from the landowners?—No, it cannot.

2986. It is almost impossible for landlords to do it out of their profits on land—I mean agricultural land—a distinguished from estates which contain coal?—Fifteen or sixteen years ago many good substantial subscription were got from the great landowners, but landowners are like other people, and when a matter is taken up by the County Council their subscriptions tend to diminish. Some of the original subscriptions probably still go on but the amount has dwindled down, and I do not think we can look forward to replacing it in the future by fresh voluntary subscriptions.

2987. Do you give any instruction in forestry?—We do not like to leave any suitable subject untouched, and we have recently had a proposal to start a little experimental place for forestry. It is a humble beginning, but we do recognise the subject.

2988. Do you think forestry is one of the subjects connected with land that ought to be scientifically taught?—I scarcely know. In the East Riding we are a region of open fields and few plantations. We are not a woodland district.

2989. Apart from your aim to train students for the B.Sc. degree of the University of Leeds, do you give any other certificate or diploma for other courses?—No. The National Diploma can be gained by three winter courses and one summer course. We find that by allowing students to come for one year they often come for a second year, and may continue for a third year, but it would not have been right to prescribe that our courses should be given only to lads who undertake to come for three years.

2990. I gather that you attach great value from a national point of view to research work?—Yes.

2991. Do you consider that even if it be not absolutely essential it is most desirable that research work and instruction work should be carried on together?—I am sure it is. Of course the lecturer cannot be carrying on research work whilst he is lecturing, except in a very modified degree, but in ordinary work one comes across matters which ought to be dealt with by means of research.

2992. You would like to control in your institution both research and instruction, and not have institution totally distinct, and solely devoted to one or the other?—No, I think that would never do.

Mr. J.
Bickerstaff.
9 May, 1907.

Mr. J.
Bickersteth.
9 May, 1907.

2993. I understand you consider it a great advantage to your institution that it is associated with the University?—An enormous advantage. It is very important that the different branches of pure science that bear on agriculture should be taught under the control of real masters of each particular subject.

2994. Is it not one result of your experience and observation that farmers are still progressing in their appreciation of the work which is being done by such institutions as yours upon behalf of their industry?—Yes, I think so. I am always meeting farmers who betray a real interest in what we are doing, whereas 10 or 15 years ago many of them probably would only have laughed at it.

2995. Would Members of Parliament be justified in urging an increased grant on the ground that the more this system is encouraged by the Government the more will that appreciation grow?—Yes, I think so.

Mr. ROBERT FISHER, called and examined.

Mr. R.
Fisher.

2999. (By the Chairman.) I understand you are a tenant farmer and a member of the East Riding County Council Education Committee?—Yes.

3000. And that you have acted frequently as a judge of farms and stock for the Royal and other agricultural societies in this country, as well as in the Argentine Republic?—Yes, I have been there.

3001. I understand you took an active part in the arrangements under which the Garforth Farm was made available for practical work in connection with the Leeds University courses of instruction?—Yes.

3002. Will you give the Committee your view as to its practical value?—I hesitate to give an opinion as to which portion of the work conducted by the Council is of the most value. Obviously the experimental work, the variety tests, and the lectures given upon them, are of more immediate interest to the present generation of farmers, but the courses of instruction given to the students (who are mostly farmers' sons), the classes for the training of teachers, and the more purely research work, are of the greatest importance looking to the future. The farming class have benefited considerably since we began work at our farm. It was not at first anticipated by many of the farmers that it would be such a success as it has proved. There was originally a certain amount of ridicule, and several persons did not look with favour upon it, but now that feeling has been almost, if not altogether, eradicated.

3003. You think experimental work and lectures are of special interest to the present generation?—Yes.

3004. And on the other hand you consider that the training of teachers and research work may be of great future advantage?—Yes; I believe that farmers in future will be more interested in research work. I am strongly of opinion that all branches of our work should be continued.

3005. You consider that expenditure on research work is quite legitimate?—Yes.

3006. And that the farmers would approve of such expenditure being increased by the Board of Agriculture?—I do.

3007. You do not think it needful to provide instruction in the manual operations of farming?—No, I do not think it is necessary that very much, if anything, need be done in that way. A labourer growing up on a farm takes an interest from boyhood in his work, and can pick it up in practice.

3008. I understand you do not think it desirable that any attempt should be made to give specialised agricultural teaching in the secondary schools?—No, I hope that will never be done.

3009. Do you believe that farmers in sending their sons to a secondary school desire that they should obtain a good general education?—Yes. I should like to point out that farmers, whenever they can possibly do so, send their sons to get a secondary education.

3010. You would like to see the number of students going from farms to secondary schools largely increased?—Yes.

3011. And you would encourage their entrance to such schools, and to the University by a scholarship?—Yes.

3012. Can you tell us what you think is the cause why so many sons of farmers are less inclined than they were

2996. Your institution seems to have a very large staff?—They are overworked.

2997. Am I right in understanding that you consider that the scope of an institution such as this is not solely to train farmers' sons, but to increase and diffuse and improve technical knowledge with regard to agriculture generally?—Yes.

2998. For the benefit of all classes interested in, or concerned with, agriculture?—Yes. Every Englishman is interested in the prosperity of agriculture.

The Chairman. I understand Mr. Bickersteth is able to return at a future time for further cross-examination, and that the next witness, Mr. Fisher, is anxious to return to Yorkshire to-night, so I hope the Committee will sanction my calling now upon Mr. Fisher.

to enter upon the career of their fathers?—They are more willing to do so than their fathers are willing to allow them to do so. The conditions of agriculture at the present time are such that many farmers are not anxious that their sons should take up farming. There is so little profit in it.

3013. Are you of opinion that the members of the staff who carry on work in the agricultural department of the college should be as far as possible practical men?—Quite so. I am strongly of that opinion. If we could have our professors and lecturers drawn from the farming class it would be much better than taking them from amongst commercial men.

3014. You want the experiments at the various centres in the county developed and carried out upon a larger scale?—I do, if funds will allow. They interest all the farmers in the district, but in a county of such enormous area as Yorkshire the experiments should be carried on at various centres where the farmers can see them.

3015. There are some experiments which you think ought not to be duplicated?—Yes, there are certain experiments that it is not necessary to duplicate all over the country, and it would be better if each district knew what the other was carrying out.

3016. Have you any observations to make upon the incidence of the rating?—I should like to say that it presses very hardly indeed upon us as farmers, and if it were not for that the farmers would, I believe look upon the spread of education in a more favourable way. I occupy twelve hundred acres of land, and assessed as I am I have to pay something like £35 for education. I think that the farmer should have some relief from the present incidence of taxation. If we were more equitably treated in that respect, I think we should take as great an interest in educational matters as any class of the community. I am rated at £1,000 a year, but a professional man earning twice as much as I do, he is perhaps only rated on £100 a year.

3017. (By Professor Middleton.) I understand that you have found the experiments that you carry on both useful and interesting to farmers?—Yes.

3018. And it is through them that you are more able to reach the farming class?—Yes. The farmers are more interested than they were at first, and now one of the first questions at the farmers' club meetings is, when can we get the Professor down to talk to us.

3019. Would you explain more fully what is in your mind in suggesting that there should be a central committee to ensure that the experiments should not be duplicated?—I think that if we carried on different experiments at separate centres money would be saved and more ground covered.

3020. Would not some of the experiments at Garforth interest farmers in Lincolnshire and Cambridge?—Yes, and they would benefit by our carrying them out.

3021. But the interest and value to the farmer arises largely from the fact that he is able to see the experiment? No doubt there is much in that, but I was dealing with the matter from an economical point of view.

3022. The experiments are duplicated with the object of extending the area of their interest among farmers?—Yes, I am anxious to see that done.

3023. You have referred to the difficulty of getting information as to what is being done in the way of experiment on other farm centres, but are there not always reports published?—Yes, we sometimes see these reports.

3024. In what could a central committee assist you by preventing a duplication of experiments?—If we had a member of the committee of these different centres upon a central board, we should know what they were doing, or if a representative of a central board was upon our committee.

3025. You would like a representative of some central body upon your committee, with whom you might consult?—Yes. We should welcome criticism and advice.

3026. (*By Mr. Latham.*) When you talk about duplicating experiments, do you bear in mind that there is a great variety of different classes of land?—Yes.

3027. And, consequently, are not the same experiments sometimes more useful if repeated in different localities?—Yes, probably so; but there are certain counties that are very similar.

3028. We have had evidence that there may be a considerable difference in the land on the two sides of the same valley, and that the same experiments carried on at different centres might be of great value?—No doubt; I do not object to that. I was looking at the matter more from an economical point of view. I should like to see as many experiments carried on as possible, and that one district should assist another with the results.

3029. You stated that the courses of instruction were given mostly to farmers' sons?—Yes.

3030. Who are they if they are not farmers' sons?—Professor Seton will know better about that than I do, but I should say that the students are principally farmers' sons.

3031. If technical teaching in agriculture is not to be given in the secondary schools, where is it to be given?—When the students come to our classes, or to such places

as our Garforth farm. I don't wish them to have any course in agriculture till they go to the farm.

3032. You think that the practical work and manual training should be given by the farmer himself?—Yes, on his farm.

3033. Your remark about farmers not desiring their sons to be brought up in the same business is, I assume, simply a question of finance?—Yes.

3034. (*By Mr. Medd.*) In regard to secondary schools, what I understand you to mean is that as long as boys are at such schools you want them to have a good general education, and not a technical agricultural education?—Yes.

3035. And when they leave the secondary school they can go to an agricultural college afterwards, preferably with an interval of practical work upon the farm?—Yes.

3036. You indicated that you could obtain reports with regard to experiments elsewhere; but are such reports or information in regard to what is done in other counties sent to you without applying for them?—I think I have had them sent occasionally, but not regularly. It would be a good thing if each agricultural centre did send round their report.

3037. If there was a more effective distribution?—Yes.

3038. At present the Board only sends out such literature if it is applied for and paid for?—Yes.

3039. If such reports and information could be distributed as widely and readily as is done in America, do you think it would be useful to the farmers?—Yes, and much appreciated.

3040. I understand you have in your Riding six agricultural education gardens; is there one in your parish?—No.

3041. You believe that the agricultural training of rural teachers is advantageous?—Yes.

3042. And that the more elementary school teachers are informed upon and interested in rural subjects for rural children the better it will be?—Yes.

Mr. R.
Fisher.

9 May, 1907.

Professor R. S. SETON, B.Sc., Professor of Agriculture, Leeds University, called and examined.

3043. (*By the Chairman.*) I understand that since August, 1900, you have been the head of the Agricultural Department of the Leeds University?—Yes.

3044. I understand you have had large previous experience and are prepared to explain to us your scheme of instruction?—The work of the department may be divided into two parts: (1) The in-university instruction, and (2) the county instruction. The indoor instruction may be conveniently divided into two periods; the first (a) extending from 1891-2 to Session 1898-9, and (b) from 1899-1900 to the present day. In the second period, as Mr. Bickersteth has explained, the whole of our work was reorganised. From the schedule which I hand in (*document handed in*) you will observe that there is a great improvement in the number of students who attended after the reorganisation of the classes in 1899. The present courses provide for only the highest form of instruction in agriculture, and include instruction in branches of science bearing on agriculture. No attempt is made in these courses to give manual instruction in ordinary farm operations, or in hedging, ditching, &c. The present courses extend to 20 weeks in winter, so that farmers' sons can attend between harvest and seed time. For those who can attend there is also a supplementary summer course, which extends to ten weeks. Students may take a course that is complete in itself in two winters without reference to any examination whatever. The National Diploma in Agriculture involves a course extending to three winters. I should not like to say that that is an ideal diploma, but my committee have not favoured the creation of a separate diploma in the University. The University authorities are also against it. They feel that no good would be gained by the multiplication of diplomas; consequently we give nothing in that way to our students who take only two years' courses. For the degree of B.Sc. in Agriculture a student must prepare for his intermediate examination in other departments of the University, and must spend two years in the department of agriculture before taking the final examination. The object of our Council has been from the outset to get hold of farmers'

sons, and give them such a course of instruction as would be of benefit to them in the business of agriculture irrespective of examination. There is therefore no undue pressure brought to bear on students to make them go in for any degree course of diploma, our main object being to give them instruction useful to them in their business. In connection with the indoor course the farm is very useful. We make bi-weekly visits to the experimental farm at Garforth, and the instruction in the class-room is largely made up and illustrated from the results of experiments at the farm. Reference has been made to the staff in our department at the college. I produce the prospectus, which gives full particulars of the staff. There are four lecturers on agriculture, including myself, one lecturer on agricultural chemistry, a lecturer on poultry-keeping, a lecturer on veterinary science, a science tutor, three instructors in horticulture, one in dairy work, and one in farriery. One advantage of our connection with the University is this, that we are able to share the services of the members of the staff in other departments of the University. We get our pure botany lectures, for instance, in the department of biology, and in natural history we have Professor Miall's lectures, &c.

3045. Your teaching staff are recognised by the University?—Yes. They are members of the University staff and are appointed by the University.

3046. No difference whatever is made?—None.

3047. Does the University contribute out of its own funds to the agricultural department?—No. The agricultural department in the University is financed entirely by the three County Councils.

3048. When your students attend lectures in other departments I presume payment is made for that?—Yes.

3049. Students can obtain the National Diploma after three winter courses?—It involves three winter courses and one summer term, although the students who attend are chiefly farmers' sons, there are some who are land-owners' sons and others who are prospective land agents,

Prof. R. S.
Seton.

Prof. R. S.
Seton.

3049a

3049b

3049c

whereas some do not intend to farm in England, but contemplate going to the Colonies. We cannot say that the students consist entirely of farmers' sons. The students are drawn mainly from Yorkshire, but a few come from other counties in England as well as from Scotland and Ireland. Indeed, we occasionally have students from foreign countries. No student is admitted below the age of 16 years, the average age on entrance being about 19. Although I see some improvement in the education of students who come forward year by year, we find that as a rule their state of general education when they come to us is not so satisfactory or so advanced as it ought to be. That applies not only to the sons of the poorer farmers who have only attended an elementary school, but also to many of those who have come from secondary schools. I am of opinion that it would not be wise to specialise on a technical subject like agriculture in elementary or secondary schools. I don't mean that it would be advisable not to deal with sciences such as chemistry or botany which have a bearing upon agriculture, but I think that no attempt should be made there to give instruction on a technical subject like agriculture. We would rather deal with a student who had had a good sound general education, perhaps with a little chemistry or even without it, than with a lad who had a smattering of science as part of his course of instruction in agriculture. It is impossible to lay down any hard and fast rule as to the age at which students ought to enter. In any case, it is desirable that before coming to us students should have some practical knowledge of farm work in all its details. Better results are obtained with a lad who has left school and worked on a farm for a year or two than with a lad who comes straight from school, but without practical acquaintance with farming. We find we can in the end turn out a better product if we get a lad who has spent some years on a farm after he has left a secondary school, even although he may have lost touch with mathematics and other subjects. Moreover, he has had more years on his shoulders and can understand better what we talk about because his mind has been developed. At the same time I do not think any rule could be formulated to the effect that a lad must not go to the University straight from school. Lads differ very much and there are differences in particular cases. I have known students who have come to us straight from a secondary school and have simply spent their holidays working on the farm, and have proved apt pupils and have done well in the end, but these are rather the exception.

3050. Perhaps you have given some thought to the curriculum which you deem desirable at a secondary school, preparatory to entering the agricultural department of the University?—No, I am afraid I have not done so.

3051. What I wanted to ask was whether you are of opinion that the elementary science taught at secondary schools is an advantage when the students begin their course at the University?—Yes, I can go so far as to say that it is an advantage if too much science is not attempted.

3052. If it is strictly elementary?—Yes, and not specialised or biased towards agriculture.

3053. You have stated that you would rather a lad went back to the farm after leaving the secondary school, even at the risk of forgetting what he had been there taught?—Yes, because I find there are so many compensating advantages from a lad having become acquainted on the spot with the practical details of farm work. We provide a science tutor who helps to make up for any lapse in their general education. He takes a class for an hour or two a week and deals with mathematics, arithmetic, mensuration or other subjects useful to them. We find that if a lad does not drink in the practical parts of agriculture when he is young, he takes it in with greater difficulty when he becomes older. With regard to the proportion of those who go back to farming as an occupation, it has been rather difficult for me to follow that out. The figures I have prepared are only approximate. Taking the list of students who have attended since the reorganisation of the classes, their subsequent career may be indicated as follows:—

	Per cent.
Farming	75
Estate agents	8
Auctioneers	6
Estate managers	6
Lecturers	5
Secretary of farmers' club	6
In an agricultural business	4
Chemist	6
	99·8

It will be seen that 75 per cent. of the students have gone back to their fathers' farms or have taken farms for themselves, and I often have the pleasure of meeting young men who passed through the courses two or three years back; these pupils are always ready to refer to the University any problems that present themselves, and they are almost invariably most willing to help in any further experimental work that may be set on foot. Some of the old students have been attracted by positions abroad—several are holding responsible positions in Egypt, others are in the Argentine Republic, but in almost all cases they have close business associations with this country and, looking at the matter in the broadest sense, I hold that they are a distinct national asset.

3054. Do you give any lectures on book-keeping?—Yes. I hand in a syllabus of our courses of instruction (*handed in*). The Committee will understand that the same staff carry on the teaching work at Leeds and Garforth, the extension lecturing and all the other branches of work in the county. Members of the staff are in this way busily engaged during the whole year. In the winter the university courses and extension lectures demand most attention. In the summer the experimental stations are in progress; school gardens throughout the county are in full work, and there is a constant succession of visits of parties of farmers to the farm at Garforth for the purpose of inspection of variety tests, &c. It is quite a regular thing to have at the farm at Garforth parties of 40 or 50 farmers day after day. These parties are often arranged in connection with farmers' clubs, and in this way cheap fares are obtained to Garforth. The members of the staff attend and explain to these parties what is being done. I encourage the members of the staff to take every opportunity of coming into close personal contact with the farmers on all possible occasions, and I am certainly of the opinion that this is the most satisfactory, if not the only way of gaining the real confidence and support of the agricultural community, which is, however, a matter of time.

3055. Do the farmers visit Garforth in order to make enquiries?—They come to make a tour of inspection, and to witness experiments at Garforth. The groups of visitors may vary in number from perhaps half a dozen to nearly 80.

3056. And now perhaps you will tell us something about your outdoor or county work?—This work may be conveniently divided under the following heads:—

- Demonstration and experimental work in all branches of agriculture is carried on at the Manor Farm, Garforth, and certain crop experiments are also arranged at other centres.
- Lectures in the county on agricultural, horticultural, farriery, and poultry keeping subjects, and demonstrations on butter making.
- Practical instruction in horticulture, including outdoor demonstrations in gardens, educational gardens (for adults), and gardens attached to elementary day and evening schools.
- Training course for teachers who are to take charge of day and evening school classes in horticulture.
- Instruction in farriery by means of lectures and practical classes at selected centres.

Experiments with crops have been carried on more or less since 1891, but this branch of the work was greatly developed in 1898 by the acquisition of the experimental farm at Garforth, when it became possible to include experiments with stock. The number of experiments conducted in the county since 1896 has been 190, apportioned as follows:—Meadow hay, 14; clover hay, 6; nationalities of clovers, 15; pasture, 4; rotation experiments, 2; barley, 7; oats, 16; swedes, 57; mangels, 3; potatoes, 66. In order to obtain reliable results the experiments have often to be carried on for a considerable number of years, and the results naturally become of increasing value as time goes on. The results are of distinct value as affording material for lectures both to students in the University and farmers in the county. The courses of lectures in agriculture, horticulture, and poultry keeping now consist chiefly of five lectures given at weekly intervals in the evenings. Courses of 10 and 12 lectures used to be arranged, but for the past few years, in order to meet the increasing demand for lectures, the courses have had to be curtailed to five meetings. In a few cases afternoon lectures have been arranged, but judged by the attendances have usually been only a partial success. The lectures generally have been appreciated, and this is shown by the number of centres that make renewed application for further courses of lectures. The lectures enable the members of the staff to get into close touch with the

3050a

3054a

3054b

3056a

3056b

farmers, and when requested the lecturer visits the farms of some of the members of his audience and discusses matters on the ground. This also enables the lecturers to come into contact with farmers' sons and to explain to them the nature of the courses provided by the University. The courses of lectures on horticulture and poultry keeping have always appealed to much larger audiences than the agriculture lectures, especially seeing that in Yorkshire there are large urban and semi-urban districts. The lectures given and the average attendances since the work began have been as follows:—

—	No. of Lectures.	Average Attendance.
Agriculture	4,613	35
Horticulture	3,140	49
Poultry keeping	1,493	68
Butter-making demonstrations	87	53

3056c Practical Instruction in Horticulture.—This instruction takes the form of outdoor demonstrations in gardens during the summer months. Evening school gardens have been established, in which the pupils are under the charge of a specially trained teacher, whose work is supervised by the University instructors in horticulture. Educational gardens for adults have also been organised. These gardens are usually the outcome of courses of indoor instruction lectures given during the winter months, and are generally established on allotments. I am of opinion that the instruction given in the evening school gardens has been most effective, especially since it has been possible to organise a course of instruction at which elementary school teachers are trained to take charge of the classes. The number of evening school gardens has increased from 7 in 1895 to 22 in 1907. There are also now 9 day school gardens and 15 educational gardens.

3057. In the case of the educational gardens no fees are charged?—No.

3058. Does the expense fall entirely on the Council?—No. The rent of the land is met by the members of the class. The only expense to which the Council are put in the matter is in respect of seed, small amounts of artificial manure, and, of course, some proportion of the salary of the instructors for the time engaged.

3059. (*By Lord Barnard.*) Who provides the land?—It is generally connected with allotments, and a portion of the allotment is set aside for the purpose of the educational garden. In addition to these educational gardens we have gardens attached to evening schools, which have been in existence for some years. Lately the authorities of the East and West Ridings have asked us to superintend the work of the gardens attached to certain elementary schools. They have asked our instructor to visit these day school gardens and superintend the work.

3060. What about the training of teachers in horticulture?—That is done by means of classes in horticulture and experimental plant physiology conducted at the Manor Farm, Garforth. The classes are held on Saturdays, and extend from September until about the following May. Pupils must attend for two sessions before they are recognised as qualified teachers of horticulture. The number of teachers in attendance on the course has increased from 9 in 1901–2 to 36 in 1906–7. The total number of teachers who have been trained during these years has been 78.

3061. Are the teachers in evening schools specialists with regard to horticulture, or do they teach other subjects as well?—They also teach other subjects. They are generally day school teachers. It was at one time thought that between the visits of the instructor the gardens might be superintended by some neighbouring gardener, but we found that the ordinary gardeners were not capable of teaching and had no sufficient idea of discipline. After the teacher obtains his training in horticulture, he is not left high and dry, but his class is periodically visited, and so is the garden.

3062. Are these teachers examined after they have gone through their course?—There are no examinations at all, and no certificate given.

3063. (*By the Chairman.*) Do these teachers come from rural or from town schools?—From both, but the great majority come from rural schools. It is only by special arrangements that we are allowed to take in teachers

from town schools who are under a different education authority. Our work is organised by the county.

3064. Do they come from any great distance?—Yes. Some have to leave home about 6.30 in the morning.

3065. Do they get any compensation or travelling expenses?—Yes. The County Council offers them a scholarship and some contribution towards their travelling expenses.

3066. Are the lectures given in winter or in summer?—They begin about the middle of September and finish about the beginning of May, going right through the winter. It may be thought that we miss the most important season—the summer—but it is not possible to get the teachers to attend throughout the whole summer. And where a garden has been established our instructor is frequently visiting it and sees that it is kept right, so that there is not much missed. If we did not give way upon the question of attendance during the summer months, I am afraid we should not be able to get the teachers at all, as they are members of cricket clubs, &c., and naturally do not want to lose touch of their own districts.

3067. If they attend one year do they occasionally also attend a second year?—They invariably attend a second year. The West Riding authorities ask us, before they allow a teacher to undertake the teaching of horticulture in evening schools, if such a candidate is qualified, and if the candidate has not attended a two years' course we do not approve of his being registered as a teacher of horticulture, and the West Riding authorities accept that view. The subject of experimental plant physiology is selected in order that teachers may be able before their pupils to deal with a plant as a plant without reference to its technical importance—to deal with the leaf or flowers, or to give simple experiments with regard to the circulation of sap, which interests the pupils in what may be called nature study. It might be advisable and probably useful to introduce other subjects into the course. I think that as at present arranged I should prefer to see experimental plant physiology retained along with horticulture, rather than see another subject introduced and this one removed. The lecturer, instead of giving a lecture, deals with various plants, asks questions of the teachers, encourages replies, makes some use of the microscope, &c. When the teachers have taken these courses, they are able themselves to conduct classes in a way that is bound to influence their pupils for good.

3068. Are the experiments in crops to which you have referred conducted throughout the three Ridings?—The North Riding has not yet seen its way to arrange for such experiments, but they are conducted in the East and West Ridings. With regard to our lectures, I hand in a pamphlet giving a list of the subjects with which our lecturers are prepared to deal. The pamphlet is circulated amongst agricultural clubs, district councils, &c., so that farmers have convenient opportunity of choosing any special subject upon which they would like courses of lectures.

3069. Who pays the lecturers?—The Agricultural Department. The local committees are asked to provide a suitable room, a table, and gas.

3070. What about the instruction in farriery?—This branch of work was started in 1903. It includes instruction by lectures and practical demonstrations in the forges in the different localities visited by the instructor. On the conclusion of the course in a particular district arrangements are made for an examination, conducted by the Farriers' Company, the passing of which entitles the successful candidate to style himself Registered Shoeing Smith. The instructor, in visiting a district, does a little pioneer work by coming into touch with the master smiths, and enlisting their sympathies for the formation of a class. I should like to say that this work is still in an experimental stage, and we are not quite certain whether it will be advisable to continue the work; but there is no disposition on the part of the County Council to discontinue it if it gives satisfaction and proves useful, and I think up to the present we have reason to be encouraged. The instructor has to meet with a certain amount of opposition or prejudice on the part of some of the smiths, but he has been able to get hold of many of the apprentice smiths, and to deal with the subject of practical shoeing in the forges.

3071. Do the farmers appreciate the result?—Yes. They want a better system of shoeing.

3072. Does the prejudice on the part of the smith still exist?—Not so much. There may be a certain aloofness, but that will wear off after a time. There is more prejudice, however, in the case of farriery than in the case of agriculture.

Prof. R. S. Seton.

9 May, 1907.

Prof. R. S.
Seton.
9 May, 1907.

3073. I understood you to say there are different classes of gardens in which you take a practical interest?—Yes, three classes: (1) Educational gardens in connection with allotments; (2) evening school gardens in connection with evening classes on horticulture; and (3) what may be called day school gardens.

3074a

3074. I think you have something to say with regard to the attitude of agriculturists towards your work?—I can testify to the sympathetic attitude of Yorkshire agriculturists of all classes towards the work as a whole. Whilst lecturing in the county it is the exception to find anyone expressing an adverse opinion as to the value of the work. Occasionally there is at new centres a certain aloofness, but this disappears when the audience realises that the lecturer is prepared to deal with a specific agricultural topic and to discuss thoroughly with his audience the technical problems arising therefrom. Perhaps the greatest interest is taken in the experimental work, since agriculturists are always ready for any information as to the relative merits of different varieties of crops or the effects of various manures. From time to time the results of experiments are distributed in the form of reports, which are written by members of the staff of the department. Year by year a greater number of enquiries are received for information on specific practical problems, and in many cases these enquiries can only be properly answered by a personal visit of a member of the staff, so that he may see for himself all the conditions and therefore be better able to give sound advice. I do not feel that I could point to any part of the work as being more important than the rest, as I regard the various parts of the scheme at present in operation as organically bound together and reacting upon each other. To secure substantial and permanent results there should be security that the work will not be interrupted in any way, *e.g.* through lack of funds, interference in administration, &c. That developments ought to take place there can be no doubt, and, in my opinion, there is a crying need for more real research. Members of the staff at present devote any spare time from teaching to the preparation of popular reports upon the various experiments that are being conducted, but there is practically no provision for such research as would require the freedom of the investigator from any other claims upon his time. There is ample room for such research in dairying, in the rearing of and diseases affecting stock, in the subject of entomology, and, of course, in the whole range of crops and new varieties of the same.

3074b

3075. You are of opinion that there ought to be fuller opportunities for research?—Yes, for some members of the staff, but I would distinguish between research and ordinary experiment. It may mean the entire abandonment, for the time being, of a man to research alone, leaving him no opportunity to take part in teaching. I do not, however, mean that a member of the staff should continue to do nothing but research; we have not yet reached that stage where any single member of the staff would be spared for research, and research only. We

cannot provide for that at present. I may mention that we have a certain amount of research conducted by the instructor in cheese-making at Garforth and on the Continent. I have here a printer's proof of an account of certain researches conducted during the past few years and commenced at Yale University by Mr. Coward. The Yorkshire Council for Agricultural Education voted a certain sum so that he might go to Yale in order that he might get into touch with Prof. Chittenden, from whom he wished to get information on a specific point as to compounds found in cheese. This is research which may not appeal to the popular imagination, and the report may be too technical for general reading by practical cheese-makers, for it deals with chemistry and bacteriology, and it is an important piece of research such as I should like to see greatly developed in the future.

3076. I suppose you think it would be advantageous if some of your scientific experts could devote themselves more to research and less to popular lectures which might be undertaken by others?—Yes, in certain cases. If a member of this staff is not fully alive to the requirements of agriculture, whether in dairying or other work, he may not direct the lines of his research in the way that practical men would like to see. For instance, there is a question about clover sickness in Yorkshire. Mr. Fisher has reported to me that he cannot get red clover to grow in certain places, and he does not know the reason. We have done a little to investigate it, and the Board of Agriculture has done a great deal more. We carried out a little experiment on the subject at Garforth for the Board of Agriculture, but we feel it would, if possible, be desirable upon such a matter as clover sickness, which is important to East Riding farmers concerned in a four-course rotation, to have a man appointed to study that for a year or two. So, in the case of milk contamination, to gain reliable information would always involve setting aside a man to do nothing but investigate that one problem.

3077. Do you think the Board of Agriculture ought to give more aid to research?—I don't care where the money comes from, but I look to the Board of Agriculture first for this special work, which I am certain is bound to result in practical utility. I should not like a research man to set out with the idea that he must strive after a certain practical result, but one might indicate to him what lines his research might follow.

3078. You want the man engaged in research to be independent of practical result, and work only upon scientific lines?—Yes.

3079. I understand you think that economics should be taught?—Yes, having regard to the fact that Britain is supplied with a large amount of farm produce by foreign countries, it seems to me that great benefit to students would arise from the inclusion in their course of study of the subject of economics.

SEVENTH DAY.

Tuesday, 14th May, 1907.

PRESENT:

The Right Hon. Lord REAY, G.C.S.I., G.C.I.E. (*Chairman*).

The Lord BARNARD.

The Lord BELPER.

Lord MORETON.

Mr. F. D. ACLAND, M.P.

Mr. DAVID DAVIES, M.P.

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Professor T. H. MIDDLETON, M.A., M.Sc.

Professor WILLIAM SOMERVILLE, D.Sc.

Mr. H. S. STAVELEY-HILL, M.P.

Mr. A. E. BROOKE-HUNT (*Secretary*).

Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. JOHN BICKERSTETH, recalled and further examined.

Mr. J.
Bickersteth.
14 May, 1907.

3080. (*By Lord Barnard.*) On the question of the total expenditure, what figure did you give for that?—I think I gave £8,000.

3081. £1,000 in all comes from the Board of Agriculture?

—Yes, and £200 of that is earmarked for experiments. Therefore there is only £800 as a general contribution to the fund of the institution or the enterprise.

3082. Then how much do the County Councils

contribute?—The County Councils contribute not quite £7,000. The West Riding gives £3,000, the East Riding gives £1,750 I think, and the North Riding gives about the same.

3083. Are there any other sources from which funds are derived—are there fees?—There are fees, and, I believe, there are still a few remains of subscriptions of various people, but that is a very small item.

3084. You do not anticipate any increase of subscriptions, do you?—No, they must be a diminishing and vanishing source of income. The fees might, of course, increase, but they would not be a substantial amount.

3085. What sort of number of scholars do you pass out of the institution every year. Do you know that at all?—I think Prof. Seton would be able to give the number each year. I think there were about 50.

3086. Do you anticipate (it does not much matter as to the exact amount) an increase of them now?—Yes, I hope the farmers' sons who attend our winter course of twenty weeks will increase. I have no reason to doubt that they will increase. The interest of the farmers is more and more attracted to the work they are doing.

3087. Of course, I quite realise that the education of students is not your only object, but at the same time, a very large proportion of these funds is spent on them, and what crossed my mind was that it was a very large sum to expend on a comparatively small output?—Yes.

3088. Do you anticipate that you will in future years turn out a larger number of finished scholars?—We shall turn out a larger number, I hope, but not so large a number that if the number is divided amongst our total expenditure we shall not incur the charge of spending much. You must remember that, in addition to our own college students, we have our lectures with very high averages of attendance, and we do a great deal to interest and instruct the farming community by the lectures given at the different centres.

3089. In other words the work done by institutions such as yours, must not be measured by the number of students?—It never can be.

3090. You think if anybody were to state that you have a very large expenditure with apparently very small results, that would not be a correct statement at all of the position?—No, it would not. It would require explanation, and the explanation could be given if it were asked for.

3091. In fact, the work done by your institution is, strictly speaking, not education at all?—No, I think I have put it before that we do claim to use our funds for the benefit of the industry.

3092. (*By Lord Belper.*) From your evidence in chief I understand you were asked a question about whether you were in favour of some consultative committee. I presume it would be a consultative committee for the Board of Agriculture to consult, and I conclude the consultative committee would be in some form or other representative of those who were engaged in agricultural education in the country?—Yes, one of the Committee asked me whether I should be in favour of a consultative committee. I was thinking of a committee something like the consultative committee that the Board of Education appoints in their work. I should be sorry to think that a committee was appointed who would, if I may say so, interfere with the details of our work. I think in Yorkshire we are large enough to have a committee to manage our own affairs. I should express approval of the idea of a consultative committee if it meant that we should have a body to whom we could go who would have stronger influence with the Treasury and get us money for a variety of objects when we wanted it. In our work from year to year, occasionally it happens that we can see that some question ought to be investigated and answered, and the answer to which cannot be written down in pounds, shillings and pence, and which ought not to be undertaken by bodies with limited funds. There you trench upon the amount of the research that occasionally we are called upon to initiate. I mean we must in our work occasionally come across a problem which requires investigation, and I would like to have a sort of consultative committee to whom to go and say "This is a problem which suggests itself to us, will you advise your Board to act liberally with us, and give us some money." A rather curious case occurred the other day. We have a man who has done some good research work in the processes of cheese making, who went on his holidays to Switzerland in order to find out the answers to some problems on which he was working,

and he found out that the Swiss Government were working on exactly the same thing. The Swiss Government has been spending £4,000 on working on that particular problem, while we in our poverty scraped together £30 for this poor fellow who went over at a cost of £50. He being an enthusiastic worker found it out of his own pocket, but when he came back what he told us was that the Swiss Government were able to spend £4,000 on it. I should like to have a committee to whom we could have then gone and said "Here, can you not get some money for us?"

3093. Then I think that the success of your consultative committee would depend very much on how that consultative committee was appointed and who they were?—Yes.

3094. And also on what duties and powers were given to them?—Yes, I should be very sorry to put our neck under the yoke of an unknown body, but I can imagine under the name of a consultative committee a very valuable aid to this kind of work being established.

3095. If you could get a committee that was largely in touch with the chief institutions for agricultural education of the country, they might be a go-between between you and the Board of Agriculture, who would do very useful work and help you in work that you wanted to bring to their attention?—Yes, they might help very much in the way of doing the work. You might do under that name work which now others do to a certain extent. They might tell us what particular work is going on at institutions of a like character. As to Garforth, it would be a pity for us at Garforth to duplicate your experiments at Kegworth, for instance.

3096. You get some grants for research work now, do you not, which is done by the professors engaged with your experts?—I am sorry to say we have nobody who is engaged on research work.

3097. You have no professional people?—No, Mr. Brooke-Hunt will say if I am wrong, but I believe the £200 is given to us for some experimental work at Garforth. It is not exactly research work.

3098. I thought perhaps you might have, as we have, a scientific member on your staff engaged in research work. We have one, and he has a large grant from the Royal Society for some special work in research?—No, we have never done anything of that kind—we have not had that.

3101. Then your institution gets a grant of £1,000 altogether?—Yes, including £200 for experiments, and there are three County Councils which contribute to the agricultural department of the University.

3102. Then practically the whole of the agricultural work, I suppose, in Yorkshire goes through the agricultural department of the college?—Yes, everything, except in the case of the North Riding where before they joined with us they had a man who did very good work in Wensleydale cheese. That is separate from our work, though he comes occasionally to the University when he is not working in the Wensleydale district.

3103. I think you have already said in your evidence that you would not be adverse to having a larger grant than you have at present?—There is no doubt about it that we ought to have a larger grant.

3104. Have you formed any judgment as to what would be the best way for these grants being allocated—on what principle?—I am afraid my conclusions on that point are rather negative. I should be sorry that the grant was given for the number of students, and I do not see that there is any particular shibboleth or test which would fairly give us the grant we ought to have. What we would like is to see our work judged by the department—judged by somebody who had control of the money, and if we are doing good work we ask for a liberal contribution. We say that £1,000 out of £8,000 is not a liberal contribution, and we ask for a more liberal contribution.

3105. Have you had that £1,000 for some little time?—Yes, we had £800 at first, and the £200 must have been given us five or six years ago.

3106. Then you mentioned in answer to a question that you would not like it to be given purely according to the number of students?—No.

3107. In fact that would have to be very carefully checked for fear that you should increase the number of your students at the expense of the teaching that you were giving to particular students?—Yes. I believe you could get more students by lowering the standard of your work. If you keep up the standard of your work your classes are not quite so popular. There is no doubt that if students are to benefit to the full extent by lectures of anything

Mr. J.
Bickersteth.

Mr. J.
Bickersteth.
—
14 May, 1907.

like the university type they must have had a general education before they come to us. A general education supplies the place of some kind of examination test, and any kind of examination test keeps off students.

3108. That is to give them as far as possible the education available by the Board of Agriculture?—Yes.

3109. And that requires larger funds?—Yes.

3110. And more skilled professors?—Yes.

3111. And distributing themselves over the shorter course?—Yes. You use the word more skilled professors, but it seems to me that those who are dealing with educational work must go in for the very best education, or it is perfectly worthless. I do not admit the existence of a second-class professor. If you want education, you must get the best man you can.

3112. Do you take in students from outside?—Yes, we do. We have paying students from outside.

3113. The evidence we have is that those institutions that take in a certain number of the highest class of outside students, and are giving the best possible education as in your case, keep up the standard of the college?—Quite so.

3114. That is because you are including in your college those who want the highest possible education?—Yes. It has been once or twice discussed on our committee whether we should raise the fees to outsiders, to out-county men, but we have always held the opinion that so long as we claim to be doing anything like university work we must welcome the whole world as they come, with the consciousness that the better the men who come the more chance we have for our students by association with brighter minds.

3115. Then with regard to one other test, should you say that, considering the different circumstances and conditions of different colleges and institutions, the salaries alone would be the fair standard to take for the amount of the grant allotted to one college?—No, I should not like that test, though I think, as far as we are concerned, or as far as Yorkshire is concerned, if that test was adopted we should benefit as much as any county in England, and yet I do not think it would be quite fair to take that as a test.

3116. I put it to you because it seemed it might be as great an advantage to you as any other college?—Yes.

3117. But at all events your view would be that you would not take salaries as a test, and you say that there ought to be other claims for consideration?—Yes. Any responsible department that goes into an investigation of the whole question of the efficiency of an institution must take into account an examination into the adequacy of the salaries they pay to their staff. I should not like to take amount of salaries as the one test.

3118. (*By Lord Moreton.*) Do you do anything as regards teaching young labourers?—No.

3119. You have I think a good deal of experience of education in regard to the National Diploma Board?—Some of our students take it.

3120. Do you consider that that is doing useful work now?—I am afraid I am not competent to give an opinion as to the merits of that particular examination. From an administrative point of view it has been useful to us as giving an alternative to the full degree examination in agriculture. At the University it is possible to take a degree, taking up agriculture as a science for boys or lads who do not want to go in for that. The National Diploma affords a recognised test, and it has been useful in that sort of way.

3121. In other words you consider that the University degree is a great deal more valuable than the Diploma?—It is a higher standard.

3122. Have you had any experience of the dairy examination conducted by the Diploma Board?—No, we do not carry our dairy students very far. We have a sort of arrangement with the Midland Dairy Institute that those who wish to go in for an advanced dairy course should go there, and from the three Ridings of Yorkshire, from time to time, we get a candidate who wishes to go in for the full dairy course, and we give a studentship at the Midland Dairy Institute rather than at Garforth. Our courses at Garforth are in practical dairying. They do not carry the students so far as the course at Kegworth.

3123. (*By Mr. Latham.*) Will you explain what your 10 weeks' course for farmers' sons is?—I ought first to say we have not got a 10 weeks' course. We began with a 10 weeks' course some years ago, and that was succeeded

by a 20 weeks' course in the winter. I believe, though Prof. Seton could give the details of it, that the students who go for the winter course, not the 10 weeks' course are taught side by side with the first year students for the University or the first year students for the National Diploma. Prof. Seton would be able to explain, in detail, what is taught them.

3124. You say you have made it possible for farmers' sons to come to Leeds for a winter course?—Yes.

3125. What does that embrace?—In any one of the three Ridings of Yorkshire if a farmer's son wishes to come to Leeds for a winter session he sends in an application with a guarantee that he is a proper man, and those applications are considered by a special committee of my council.

3126. Will you kindly say what the special guarantee is?—The only guarantee is that he is a farmer's son or intends to take up farming as an occupation, and really honestly wishes to benefit by the course.

3127. Do you find that they go to two scientific winter courses as a rule?—Yes, they do now. Those that come for one winter often stay for two consecutive courses.

3128. And the summer course?—Not always. Some of them come for the winter course and go away, some of them come for two winter courses, some of them come for two winter courses with a summer course in between. We make it easy for them to come for a short time if they cannot come for a long time, but we find very often that a lad who comes once persuades his father to let him come again. We do not insist before they come that they shall promise to attend for a whole year or two years.

3129. Do you say the three County Councils will grant scholarships?—Yes.

3130. Of what type are they?—The scholarships are specially awarded on the recommendation of the Committee, who satisfy themselves that the candidates are likely to benefit by the course. There is a very simple test examination which is not a competitive examination, and in the East Riding, as to our scholarships, we could give more than come. In the North Riding, I think I said the other day, the applications are rather more numerous and they are not able to take them all. The applications from some of the small farmers in the dales of the northern parts of the North Riding are more numerous than the applications from districts where the larger farms are.

3131. Are those scholarship students that go in for these two winter sessions and the summer session?—Yes.

3132. Is the summer session more practical than the winter session?—That, I am afraid, Professor Seton could better answer. All through the winter as well as the summer they attend two days a week on our farm at Garforth. The farm is about eight miles from Leeds.

3133. How far does the veterinary attendance go?—I could not tell you that.

3134. How far does your farriery instructor go. What class of instruction does he give?—That is a question which I am afraid I am unable to answer. His classes consist of blacksmiths.

3135. You say "The conclusion I have arrived at after experience in the work of the University Departmental Committee, the Joint Committee on Agriculture and of the Education Committee, for my own county is, that the work of agricultural research and the provision of agricultural education from the University to the village school should be controlled by the same body." Is that what you think is the principal thing to consider with regard to young farmers?—Research?

3136. Yes?—No, I do not think so. I think if I were to limit my commendation to research I should be wrong. I think that where we help a farmer is by bringing him into actual touch with the conclusions that scientific men have come to. Of course, research work presumes rather that the scientific man is going on to fresh fields of experimental work. We reproduce at our demonstration class and at our farms the conclusions which have already been arrived at by scientific workers, and that is one of the strongest reasons for our existence. We make the worker in the industry come into familiar touch with the conclusions which the trained observers, the scientific men that is, have arrived at.

3137. Have you come to the conclusion that this teaching process is unduly high for an agriculturist?—That the agriculturist has to pay too much for it?

3138. Yes?—I think so.

3139. Although it is for their benefit?—I think according to their ability they pay most liberally, but I think that the limit of their ability is nearly reached, and that

further developments which we must look forward to ought to be assisted from Imperial sources.

3140. That is, that if the Board of Agriculture had more funds it would be a great benefit to this work that we are now concerned with?—I think so. I think that we should be able to develop and improve the foundation we have already laid.

3141. You made the remark that there was a winter staff continually engaged in giving lectures. What sort of lectures are they, may I ask?—They are lectures given in the various districts on the application of farmers' clubs. We have a list of lecturers with the names or topics of their lectures, and the farmers' clubs ask for a particular lecture. But the lecturers have general instructions to stick as closely as they can to the facts afforded to them by the demonstration plots that are in the neighbourhood of the place where they give the lecture.

3142. You go on to say that "When we began our work we found the farmers inclined to doubt whether we could do them any good, and inclined to ridicule our efforts." Is that decreasing?—That ridicule is certainly decreasing. We are gaining the farmers' sympathy and support in our work.

3143. And confidence?—And confidence.

3144. You say you get rather different types of students from different parts of the county?—Yes.

3145. Will you just explain what type of students you get altogether?—We get the sons of large farmers, well-to-do farmers. Rich farmers send their sons to us. We get sons of men who are land-agents themselves, and we also get the sons of the small farmer, the farmer, that is, who is a working farmer.

3146. What percentage of these students are purely agriculturists?—Professor Seton has an interesting table, and he has worked it out, I think. He has put the table in. The percentage of our past students who actually go in for farming is 75 per cent. They have gone back to practical farming and the others have gone into occupations kindred to farming. It is an interesting table and I think it was put in.

3147. Do you agree that work on the farm is very beneficial to the agriculturist?—The farmers tell us so.

3148. I think it was you who gave us some illustration of what was going on with the milk in your county. We should be very glad if you could go further into that.—Yes. There was a suggestion made to our Council that an investigation might usefully be gone into in connection with the amount of contamination which milk receives from the moment it leaves the cow till the moment it reaches the throat of the consumer. I think people thought that the country was, perhaps, too much blamed for all the pollutions that are ultimately found in milk, so we began an investigation. That means the analysis and bacteriological examination of six samples of one consignment of milk. It is analysed when it comes from the milking shed; it is analysed on the railway; it is analysed in the railway dock and it is analysed in the shop; and it is even examined after standing in the consumer's house for a few hours. That investigation has only just begun, and I do not know what the result of it will be.

3149. Will that be published?—I hope so. It will last certainly for a year. It is not conducted under the direction of the Yorkshire Council for Agriculture, because they felt that they had no funds for that; but it is being conducted by the sanitary committees of two County Councils and four or five County Boroughs. All the Yorkshire Council of Agriculture has done has been to provide at Garforth, our farm, laboratory accommodation for the expert who has been specially engaged by the sanitary committees.

3150. Does that cover a large surface?—It will consist of consignments of milk, and analyses of milk sent from a good many places into a good many towns in Yorkshire. That is all.

3151. (By Dr. Somerville.) A very large proportion of students who come to the College or University of Leeds are supported by county scholarships, are they not?—Yes.

3152. Do you apply any test of minimum income as regards parents whose sons are appointed to scholarships?—No, we have not yet done so. I think the committee would if there was a conflict. If it was necessary to distinguish between them they would give preference to the poorer parent, but there is no test laid down for them.

3153. I suppose that the number of scholars that are thus supported, and have in this manner educational facilities put before them, is a very small one when the whole of the agricultural population is taken into account?—Yes.

3154. As regards the others, then, that are not fortunate enough to get scholarships, I take it that their technical education in agricultural science is only provided for through the agency of these local lectures?—That is all.

3155. I suppose these local lectures are less educational than instructional?—Certainly they are instructional.

3156. Now, I notice that in the *précis* of your evidence you deprecate the formation of local agricultural schools; is not that so?—I should deprecate the establishment of agricultural sides to secondary schools.

3157. You would not, perhaps, go so far as to deprecate the establishment of agricultural schools of a type somewhat different—one might almost say somewhat lower—than the type of instruction that is given in the University?—I am only expressing an opinion, but I should not be in favour of the establishment of such schools. One of the greatest evils of the farming profession is the "grooviness" and narrowness which seems to prevail. The farmer goes on going to market as his father and grandfather went, and if, instead of sending his boy to an agricultural school, he sent his boy to a high school, where he would sit down side by side with boys whose relations had nothing to do with farming, I think the boy would get a lot of good.

3158. I am not thinking of an agricultural school, or the agricultural side of a secondary school, as a preparation for the University. I am rather thinking of it as providing the only technical education in agriculture that seems possible for the bulk of your youthful agricultural population. How are they going to receive any direct instruction if the whole of your agricultural work is done in that way?—By apprenticeship.

3159. That is as regards the manual processes and the commercial side of the business; but surely there is a certain amount of science that must be very useful to a farmer, even if it is not of a higher type, and is not itself absolutely exhaustive?—I do not think it would be possible in a scattered district like ours to have many centres of real light in the place. If you have an agricultural school that is not quite of the best kind you would be doing more harm than good. We want to get hold of those who are entering from the lower grades of life and from the labouring classes into the farmers' class and make them understand that our best farmers like to be in touch with our professors.

3160. I suppose that most of the scholars that come, that is scholars in the sense of a student receiving support, reside during the academic period in the town?—Yes.

3161. That is to say they do not travel daily to any great extent by rail, do they?—No. I should think probably we should find that nearly all of them come from the country districts. We give them a maintenance allowance.

3162. In the North of Yorkshire, for instance, is it not conceivable that it would be an advantage to have, not what I should call inferior education, but education of a type which is not carried so far as, we will say, to make a man capable of carrying through a chemical analysis, but still going far enough to enable him to judge of the value of the figures that indicate the chemical analysis of, say, a manure; and would it not be well to give such instruction as would enable him to measure areas of land, and give him instruction in the principles of nutrition, and the value of the constituents of cattle foods, and such like things?—My answer to that is that it would be absolutely impossible to have universal specialisation in our secondary schools. But, taking what you say, we want the farmer to be sufficiently educated to appreciate the relative values of the constituent elements of some particular manure, and he is more likely to understand the importance of that if he has received a good education in a good secondary school than if he has devoted all his time, or a great part of his time, to attempting to specialise. General education is what makes a man understand that good things are worth paying for.

3163. I will put it to you in this way. I suppose we are all agreed that Germany has got a larger number of universities in proportion to the population than we have in this country?—Yes.

3164. In Germany one finds a great many subsidiary centres where education of a certain type can be given through the agency of certain schools?—Yes.

3165. Do not you think such an idea might be practicable in this country?—It might, but we have not got to the

Mr. J.
Bickersteth.
14 May, 1907.

Mr. J.
Bickersteth.
14 May, 1907.

point when our farmers' sons have got a good general education. What I want to see is a lad of 16 well educated. If you have a lad of 16 whose instruction has been not of a special character, but of a gymnastic character, and with regard to whom the subjects have been chosen because they appeal to his reasoning faculties, if you turn him out at 16, and he goes to hear lectures from a competent agriculturist, he will appreciate them better than he would with an inferior education in specialised subjects. If you multiply your specialised schools indefinitely, and have one centre for farmers, and one for commercial travellers, and one for bankers, you will not have such good results as if you have one school for intelligence and you turn them out intelligent members of society. The object of education is to make people defer to the expert.

3166. Then, I take it, in your opinion technical education—that is to say, education specialised according to the requirements of agriculture—is not necessary for the great bulk of young farmers?—It is not necessary for the bulk of any class under the age of 16.

3167. As a matter of fact, I suppose your three County Councils, powerful and wealthy as they are, cannot undertake to provide scholarships for the sons of every farmer in Yorkshire who desires education for his sons, and cannot undertake the responsibility and task of sending them to Leeds?—At present we are able to send to Leeds nearly all who wish to go; we have not reached that point yet.

3168. But still, after all, those who wish to go, as has been pointed out, are a very small proportion of the total population, and do not amount to 5 per cent.?—No, not of the population.

3169. In your district you indicate, in your evidence here, I think, that if larger funds were placed at your disposal you would suggest that these funds should be to a considerable extent utilised in developing local demonstrations?—Yes.

3170. In what other ways would you suggest that those funds might be used?—We want more money for the development of our farm work at Garforth. We have been talking for years about some sheep-feeding experiments, but we are unable to do that for want of funds, cannot put up the sheddings, and there are various matters that come up before the committee from month to month that are put off because of want of funds. The situation has changed so enormously since the counties were rich with the "whisky money." They are now poor with the "whisky money" plus an education rate which has to provide for the education of the people generally.

3171. Do you mean you are hampered to some extent by the fact that the "whisky money" is a decreasing amount?—It is a decreasing in actual amount, and also it is constantly being drawn upon for matters other than higher or technical education.

3172. Then your development, you think, would be in the direction of research and demonstration development rather than in purely educational directions?—I think so. But I am only expressing my own opinion.

3173. Have you in Yorkshire considered the question of providing instruction and education in forestry?—Professor Seton could speak more definitely about that. We have made a very small beginning at Garforth. We have set aside a bit of a field for some very elementary experiments.

3174. Possibly if you have not developed in that direction it was because you have not had funds at your disposal?—Quite so. That is one of the matters we should develop in, I think.

3175. (By Mr. Medd.) I think in your *précis* you say the agricultural education of an area comprised within such an institution as Leeds should be controlled as far as possible by some local body?—I think so.

3176. Does the agricultural department at Leeds issue a scheme to cover all the requirements of the agriculture of those three Ridings each year, after consultation with the three County Councils?—I think so. The Agricultural Council is representative of the three councils.

3177. It is representative, but I mean to say do you at your formal meeting at the commencement of each year take into consideration the requirements of each locality and formulate a definite scheme to cover the agricultural needs from the elementary schools up to your University?—I have indicated, I think, in my evidence that the Yorkshire Agricultural Council is deliberately of opinion that when a boy who wishes to improve himself leaves the ele-

mentary school and goes to the secondary school, he ought to go to a secondary school where agriculture is not taught.

3178. Exactly, but I do not know whether I made myself quite clear. You say that it is very desirable for one authority to control all agricultural education within this area. As a matter of fact, does this Agricultural Council take into consideration all the requirements of that area, and go carefully through them, and formulate a definite scheme each year?—We do not make a new scheme each year, though there is a yearly opportunity for revision.

3179. You do not take into consideration what may be needed in the extreme North Riding, or the extreme East Riding, but you merely, so to say, continue the same work you do year after year?—We are in constant touch, both by the members of the Council and our professors, with the farming interest, and any suggestions which any locality might make would be carefully considered.

3180. I notice that you do not make any provision for the intermediate agricultural education of those three Ridings, do you?—We do not think it would be a good thing to do it if we had the money.

3181. And you have never attempted, have you?—It has been attempted, and it is partly on the experience of receiving boys who have been where there has been an agricultural side that our professors have decided that it is better to let us have boys who have not been taught agriculture.

3182. That is having regard, is it not, to pupils who are coming to you?—Yes.

3183. And not having regard to those who never can get to you?—That is so.

3184. Now I think most of us are agreed that agricultural sides to secondary schools are, as you say, a failure, and are not desirable; but Professor Somerville was speaking rather I think of intermediate schools of agriculture. You have also in Leeds, have you not, technical schools and classes of various types for various industries?—Yes.

3185. At which pupils are received up to the age of 13, 14, 15, 16, and so on?—Not at the University.

3186. No, but in Leeds?—Yes, in Leeds.

3187. If you think that these technical classes and technical schools are of advantage to those going into the textile industries, and so forth, do not you think that corresponding classes and schools would be useful to boys going into agriculture?—Corresponding classes in schools?

3188. Corresponding classes and schools?—There are technical schools in our big towns. We in the East Riding have an arrangement with the City of Hull that our lads can go into their technical school. I do not think it would be desirable for us to encourage the Hull Technical School to have an agricultural class.

3189. No. The point is this: if you think it desirable for a boy going into a textile industry to have a textile school or technical class, why should not it be equally desirable for a boy going into agriculture to have an agricultural class or school?—I am not an authority on textile industries, and I do not know whether young boys who have passed through technical schools between the ages of 14 and 17 are very much the better. My idea of the great work that some of those technical schools in the big towns are doing (I speak without much knowledge of them) is the power that some of them have of attracting to evening classes older boys and women who have been engaged in the industry during the day, and come there at night; and so, I should think that our work is gradually encouraging the whole of the farmers to understand that after they have begun farming they must still look to the conclusions of scientific men to help them in their work.

3190. Exactly; you in Leeds are feeling now the great benefit that comes from the combination of work in the workshop and instruction in the class room, are not you?—I speak without any knowledge on that.

3191. It is very extensive in Bradford and elsewhere, and do not you think that with agricultural classes the farmer could equally benefit from a similar combination of practical work upon their own farms, with the technical instruction in winter classes?—I suppose in Bradford, within a radius of a mile, in the technical schools there are many thousands of pupils engaged in particular industries. But the farmers living in scattered districts, with only one house every two or three miles, cannot possibly have the same treatment as you would give to the closely congregated communities in towns. You cannot do it. No power in the world would

make it possible for the farm labourer to go to a technical school at night. He could not do it.

3192. Why should a form of instruction found useful and practicable elsewhere be so entirely impossible within your area. I refer, of course, to the intermediate practical school of agriculture?—I only know this, that I do not believe it would be possible to have evening classes in agriculture in our best farming districts, because of the extraordinary distances the lads would have to travel. I know that evening schools even in some country places are a great success, but I also know that though we have tried, and tried and tried in scattered districts, you cannot get the lads who are engaged in farming in districts situated such as parts of Yorkshire are situated to come to evening classes.

3193. I was not speaking of evening classes. I was speaking of winter schools. I understood you to say just now that you found considerable difficulty in receiving sufficient applications for your scholarships for the winter course?—Yes.

3194. Do not you think there would be a greater response if you took the instruction to the people instead of asking the people to come to you for the instruction?—I think the quality of the instruction would suffer.

3195. If it is practicable in remote and scattered districts in Ireland to conduct successfully winter classes for 26 weeks at Monaghan and Downpatrick, where the population is much less numerous than with you, why should it be impossible with you. You have never tried the system, have you?—No. I think we have spent our money wisely and we have none to spare.

3196. But at present you have this great gap, have you not, between what little work you do in the training of teachers and the provision of day school gardens and the people who come to you, and there is nothing otherwise done locally beyond occasional lectures for the small farmers and the better class labourer?—There is a great deal being done to make it possible for the small farmer's son and for the labourer, too, to attend secondary schools. We have spent a good deal of money in the establishment of secondary schools, and we would rather they went to secondary schools than to technical schools.

3197. I will not press the point further, but it comes to this, that you believe your whole educational policy in Yorkshire is to provide efficient technical instruction for people engaged in all industries other than agriculture, but you believe that would be impossible in the case of agriculture?—I think we have provided for agriculture. You do not take into account the extraordinary advantages that our labourers have in Yorkshire in watching the operations of farming conducted in the best possible way by the farmers themselves. Our farmers do make many things grow that do not grow in other places, and they make them grow well. They grow good crops, and they make many of the labourers, attached to these farms as apprentices, learn a great deal.

3198. Yes, everyone admits the excellence of your work, but all I desire to see is its extension and development in other directions so as to benefit a class at present neglected, and one which is the most difficult to deal with. Then in regard to your summer course, in what months is the course held?—May, June and July.

3199. Do the farmers experience any difficulty in coming to you in the summer?—We made the winter courses complete in themselves, and in order to make it possible for them to come easily we let some of them come in summer.

3200. I see you have stated that there is a summer course combined with it?—Yes.

3201. Then in regard to the continuation school work you used to have a system of giving theoretical instruction in horticulture during winter, followed by practical instruction in gardening during summer. Is that continued still?—Yes, at Garforth that goes on still.

3202. And is it successful?—We have model gardens at Garforth and we have a considerable staff of teachers there.

3203. What are the educational gardens in the East Riding and, I think it is, the North Riding?—They are evening school gardens, I suppose. That is where we guarantee the efficiency of the instruction. We have to prove the efficiency of the instruction and we send our professor, who goes and generally controls the syllabus of work done.

3204. Then in those educational gardens you give them a special course?—Yes.

3205. Are they cultivated by the men themselves, or are

they model gardens?—They are cultivated by the people themselves.

3206. Then, in regard to the day-school gardens, is instruction given there by your instructors?—In the elementary day school?

3207. Yes.—No.

3208. By the teachers themselves?—Yes, by the teachers themselves. There are not very many of those. They are only beginning.

3209. What is the attitude of the parents themselves towards that instruction, so far as you know?—In some of the country parishes it is surprising how they dislike it. It is a most deplorable thing. There is one case I remember, where we tried our best to get a garden class attached to an elementary school, and we had a unanimous refusal by the managers, or by all of them except the correspondents who had been in communication with me and the teacher. We wanted to do it, but the feeling in the village was so strong that we could not manage to persuade them.

3210. But in some places you have found these teachers who have been trained by you a real benefit to the agriculture of the district. That is mentioned in one place?—Did I say so in my proof?

3211. I think it says that in this Report?—I wanted to make it quite clear that we do not approve of agriculture being taught

3212. "A great benefit to the agriculture of the district," I said. This is how it is put in the Report: "It is no uncommon occurrence to meet a teacher who is making an excellent instructor in practical horticulture and whose whole initial training took place at Garforth"?—Yes, I think that must be Professor Seton who said that.

3213. It is in the Government Report. Do the scholarships cover the cost of maintenance?—Yes. I was asking Professor Seton about it the other day. We give them 15 shillings a week, and they spend, perhaps, a shilling or two more than that.

3214. In reply to Lord Belper, you said the whole of your work should be judged by the Department?—Yes.

3215. Do you think that might be facilitated if the whole country were divided into definite areas and inspectors appointed for each area?—That would be an administrative question for the Department to decide. I think it would be a pity to insist upon absolute uniformity. We are all of us experimenting in this work, and what might be suitable in one part of England, and possibly suitable in another part, might not be quite practicable just at once.

3216. No, I only meant to facilitate your work by bringing it into closer touch with the central authority?—We are in very fairly close touch with the central authority, and we have often visits from the inspectors. They come down and see us: that might be developed.

3217. (By Professor Middleton.) You have no less than four lecturers available to give lectures, namely, Professor Seton, and Messrs. Haydon, Archibald and Stewart?—Yes.

3218. I think it is the case that with regard to Messrs. Haydon, Archibald and Stewart, a great part of their work in the county is the giving of lectures?—Yes, peripatetic lectures.

3219. In Yorkshire more than any other county you are in the habit of giving systematic courses of lectures throughout the county?—Yes. I think the tendency has been rather to reduce that. There used to be 12, and there are now very often only six.

3220. I see, for example, you mention that there are 10 lectures on soil and on cultivation and on manures?—Yes.

3221. In other words, you have undertaken the work of giving courses of instruction and lectures in agriculture by thoroughly competent men throughout the county?—Yes.

3222. But in spite of that you find that the type of lecture which is being appreciated is the one dealing with experiment or demonstration?—Yes.

3223. That is to say you do not find your agricultural population take readily to lectures on principles?—Professor Seton would answer that question much better than I can. But that is quite a fair conclusion to draw from our experience.

Mr. J.
Bickersteth.
14 May, 1907.

Mr. J.
Bickersteth.
—
14 May, 1907.

3224. In your evidence you mention the fact that there was an instruction for lecturers to deal with the results of demonstration plots?—Yes, quite so.

3225. I suppose it is largely because of your experience in attempting to teach the principles of agriculture through out the county that you have come to the conclusion that what the farmer really wants is a good elementary education?—Elementary and secondary education. The rest is general intelligence. He will more readily appreciate what the scientific man has to tell him if he has a good general education.

3226. You have attempted for years, so far as I can understand your system, to teach the principles of agriculture by very well qualified instructors?—Yes.

3227. That has not been the most successful part of your work?—Except that that has borne a great share in what we think is almost accomplished, that is, the destruction of the prejudice that used to exist on the part of the farmer against all scientific work. They have been our missionaries, and they have done good work.

3228. But in looking at your county from the outside it rather seemed to me that your lecturers have become successful since they began to deal with the experiments made in Yorkshire and with the work done at Garforth; your lecturers have been successful for just as long as they have dealt in local questions. Did they always get large audiences in the early days?—In the early days I should think they got larger audiences than they are getting to-day, but the quality of the audiences, judged by the proportion of practical farmers attending, is better now. We used, if we had a popular lecturer in a country town, to have a crowded audience, but they were not all farmers.

3229. You have already stated that all the young farmers who wish to go to Leeds are able to get assistance to go there?—Yes; but we would like, of course, to look forward to the time when we could impose a severer test.

3230. You have extended your course from 10 weeks to 20 weeks?—Yes.

3231. Do you not think that that may have shut off a certain number of young fellows from getting to your classes who would otherwise have attended?—We did not think so when we made the change. I do not think it has been so. I think that the farmers were rather unwilling to send their sons at once for 10 weeks, and when we got them there we did not make the change from 10 weeks to 20 without carefully considering whether we should stop some of them from coming, and we thought not.

3232. What was the chief reason for the change, may I ask? Was it to improve the course from an educational point of view, or was it a staff difficulty?—Had you not a sufficient number of teachers to conduct a double course?—I am afraid I forget whether that was discussed much at the time when the change was made. I think it was, perhaps, that when we got the authorities at the University to make Agriculture a part of the requirements for a degree there was always a tendency to make the course coincide with the the university terms.

3233. (By Mr. Davies.) I think you told the Committee that the scholarships were awarded by committees?—Yes.

3234. They are not awarded by the County Councils then?—I suppose they are technically awarded by the County Councils, but the County Councils accept the nomination of the committee.

3235. That is the committee controlling the college?—The Yorkshire Council for Agricultural Education of itself is looked upon as a committee by the Leeds University, and it is, I think, looked upon as a committee of itself by each County Council. So that when the County Council awards a scholarship on the recommendation of the Yorkshire Council of Agricultural Education it has no sense that it is acting in any different way than when it awards a scholarship on the recommendation of its own Higher Education Committee.

3236. You told the Committee you have a test?—Yes, they do pass a little examination to see whether they are competent.

3237. Are those scholarships awarded for the short course or for the degree course as well?—There is a special scholarship for the degree course. I think the three councils give what they call a class A scholarship tenable at the University. In every Riding that can be competed for by anyone wanting to go in for the degree course in agriculture. But apart from that, if one of these subsidiary agricultural scholarships should be awarded to a lad for one year, and he were to persuade his father to let him stay for three years and allow him to go on for

a degree, I have no doubt the Council's scholarship would be renewed from year to year to enable him to do so.

3238. The scholarship which he got for one year would be renewed?—Yes.

3239. Then these courses do not go on from year to year?—No. They are for one year, and they require renewal even for the summer course. A boy would not be entitled to go for the summer course unless he was recommended by the professor as being a fit student.

3240. Does the scholarship cover board and so on?—Within a shilling or two, I think. The scholarship fees and maintenance allowance is as much as 15s. a week. It very nearly suffices to keep a boy at Leeds.

3241. Do many of the students attend the short course?—Some do. Professor Seton could tell you the numbers better than I can. I know there are some trained students. They are not from my Riding, but there might be some from the West Riding.

3242. Speaking broadly, you have not yet been able to induce farmers, although there are a great number of large farms in the county of Yorkshire, to see the desirability of their sons getting scientific instruction in agriculture, and you have not been able to impress upon them that it is worth while paying something for in order to get that instruction? You have really had to pay them to send their sons to college—does not it come to that?—We have up to the present, but I think there are a good many farmers now who would pay. I think the number will increase from year to year. People will value it so highly that they will be willing to pay. I do not despair of getting them to come, but it must be by a gradual process of development.

3243. But that has been your experience up to now?—Yes.

3244. Then are the scholarships held by some of the sons of the small farmers?—Yes. I am told that the North Riding students have mainly been the sons of small farmers.

3245. But you do not make any distinction, based on ability to pay, in regard to sons of people who are better able to pay?—No.

3246. Then as to the type of man who comes up for your short course, are they men who are able to appreciate the instruction that is given them?—That is a question which Professor Seton could answer much better than I can.

3247. Then I think you told Mr. Medd that it was rather difficult to arrange for a short course for students in the country winter courses?—I think it would be.

3248. How then are the lecturers in the college able to arrange for their lectures in different parts of the county? How about the peripatetic lectures?—I think the peripatetic lectures are given at fewer centres than would be necessary if there was a network of schools available for the lecturers. The peripatetic lectures are given very often in the country towns. A village six miles from the market town, with scattered farms round it, would be almost a necessary centre for the farm school, if you are going to take the lecturer to the actual worker. But fewer centres are enough for the farmers who can drive in. If you were to have something like evening schools for the labourers you would have to have ever so many more than you would need if you were only catering for the farming community, who most of them have a horse and cart.

3249. That has been attended in other parts of the country with some success?—Yes.

3250. Then I think you told the Committee you objected very much to any kind of technical side in the secondary schools?—Yes.

3251. Would you also object to the distinction between a modern side and a classical side?—No, I do not object to a modern side and a classical side, and I do not object to science being introduced into schools either; but what I would like to explain is that I think everything taught to a boy or girl under 16 ought to be framed gymnastically; that is, framed because of the educational benefit of the subject, not from the utilitarian point of view. It might be quite proper to let a boy whose genius lay in a scientific direction take science, but the science should be treated educationally and not professionally. You cannot with profit teach a trade to a child.

3252. It would help your students a good deal in a short

Mr. J.
Bickersteth.
14 May, 1907.

course if they had a sufficient course of science in a technical school, would it not?—It would help very much if the young farmers who come to our classes came with trained intelligence, and whether that intelligence was trained by what we generally mean by a grammar school education or a scientific education does not very much matter. Of course what we want is for them to come so that they can appreciate a lecture and take a note of what is said to them.

3253. Then one other point with regard to the lecturers themselves. If these courses go on for 20 weeks in the year, how do you employ the professors and lecturers for the remainder of the year, because most of the work seems to be done during the winter months? How do they employ their time during the summer?—They have to look after the demonstration courses. They have to do a great deal of work on the farm in the way of conducting experiments. But again Professor Seton could tell you how he employs each of his men in the year. It is not difficult even without allowing for any holidays. I know they are working all the year round. From the time the lecture season begins they have to be told off to meet batches of farmers. They have organised parties of farmers of 50 or 60 going to the farm, and one has to be told off to take them round.

3254. Are they fully occupied the whole of the year?—Yes, the whole of the year.

3255. Then, with regard to giving the grant, how do you propose to deal with the grant? Do you consider the present staff are underpaid?—No. One or two of them are, perhaps, but I think we pay ample salaries. We should like another man. We should like to be able to allow one man to give more time to local experiments. We should like to have the opportunity of sometimes taking a man off lectures altogether, and letting him devote his attention to some particular research work, and we should certainly like more money for our equipment at Garforth.

3256. Have you made any provision for agricultural libraries?—No.

3257. By what means are you distributing your literature so as to reach all types of farmers?—We generally address publications to the agricultural clubs. There are agricultural clubs in nearly every district, and we send publications to the secretaries and ask them to distribute them.

3258. Do you make a charge?—No, we do it for nothing.

3259. Then the agricultural department of the University distributes leaflets throughout the county?—Yes.

3260. Do you find the farmers appreciate those and make use of them?—That is again a question which Professor Seton could answer. He sees the farmers every day, and I do not.

3261. (*By the Chairman.*) I understand that your relations with the University are, that you say to the University, we want such and such work done?—Yes.

3262. You give the University your idea about the educational work which should be given?—Yes.

3263. The University does not say to you, here are the lectures we wish you to give?—No.

3264. But you propose to the University that certain lectures should be given, and then, provided you supply the money to the University, you always find the University is ready to enter into your views?—Yes. There has been no friction whatever between the University and the County Council.

3265. Do I understand that Class A scholarships are absolutely open?—They are absolutely open.

3266. To anyone?—Yes.

3267. Those are given at an examination, are they?—They are given at an examination.

3268. By the University authorities?—No, not by the University authorities, but by the board of examiners, which is of equal rank.

3269. How are the Class A scholarships organised?—The Class A scholarships would be organised by our education committee. Just now we are using for their Class A scholarships the matriculation examination, not of the University of Leeds, but of the joint board of the Northern Universities. I mean, the examination is of the highest possible character.

3270. That is the test which is applied for these Class A scholarships, is it?—Yes, for these Class A scholarships.

3271. Then, in addition, you have what you call subsidiary scholarships?—Yes.

3272. And they are given by what might be called minor tests?—Yes. No severe educational test. They are given to farmers' sons who are likely to profit by the course.

3273. They are given by selection?—Yes, by selection.

3274. At the end of the first course for the subsidiary scholarship, if it is shown they are not fit to go on, then they are got off?—Yes.

3275. If they are through the first year, if they show sufficient aptitude, the scholarship is renewed in some way?—Yes.

3276. On the recommendation of the professor, I suppose?—On the recommendation of the professor.

3277. Then, are these scholarships sufficient? Is it not necessary for them to supplement them by additional expenditure?—No; you may practically take it that the maintenance allowance covers the expenses.

3278. That is there is sufficient for Class A and for that subsidiary class?—For the Class A it is £60 a year, and I suppose it would have to be a very economical student who could live entirely on that.

3279. Then is the subsidiary scholarship of a greater amount?—It is for a shorter time. I think the fees in the University are about £10 for the 20 weeks. There is £15 allowed for maintenance. The Class A scholarship would be certainly equal and perhaps rather greater in amount, but probably it would be swallowed up by the fees, which would be rather higher. Instead of paying fees for only one department, they have to pay for special things.

3280. But in both cases you think the amount is practically sufficient to keep them?—Yes, it is practically sufficient to keep them.

3281. Then are there many students who pay?—There are students who are paying. I do not say many.

3282. But there are farmers who are prepared to pay the whole cost?—Yes, and farmers outside Yorkshire also.

3283. There are other students in the University department who pay the fee, are there?—Yes.

3284. Might I ask you with regard to the large class of farmers whose sons cannot attend the University and whose sons cannot get a scholarship, and who have not got the time, and who therefore leave off at 16, say; you would not object to a higher elementary school being organised in such a way as that there should be attention paid to the application of science in an elementary form to agriculture, without taking away the character of the general education?—Even there, if I were framing such a course, I would avoid the use of the word agriculture. I mean I think we should do harm if we were to recognise for a moment that either in the elementary school or in the higher elementary school the science of agriculture should be taught.

3285. I am not mentioning the science of agriculture because I see your point of view. I am mentioning merely, this, that in the illustration of such sciences as are taught in the higher elementary school, attention should be paid to the needs of the agriculturist?—Yes. Wherever your elementary school or your higher elementary school or your secondary school exists, it is desirable that the teacher should draw his illustrations from objects familiar to the children whom he has to teach.

3286. You agree in that?—Yes, that is the intention of education, and that is why I am anxious to make people clearly understand that I deprecate the introduction of agriculture into an elementary school. We are none of us opposed to the intelligent application of any object lesson that is given by the teacher, and the illustration of that lesson by the objects which are familiar and ought to be familiar to all the children in the school, and we do all we can to encourage it.

3287. (*By Mr. Medd.*) Would you be prepared to admit scholars from other counties to Leeds for scholarships tenable at Leeds?—We should be very glad to see them.

3288. (*By Lord Belper.*) Do your Council levy a rate for secondary education?—Yes.

3289. What is the rate?—A penny in the East Riding.

3290. The grant for elementary education in some country districts means a very large extra rate upon the agricultural classes?—Yes.

3291. Has that made it more?—Yes, it has made it very much more, and we should also remember that out of the higher education rate there is a very great deal of expenditure that ought to be for elementary education, but which is called higher education.

Mr. J.
Bickersteth.
14 May, 1907.

3292. You refer to the training of teachers, do you?—Yes. In my small county of the East Riding of Yorkshire when we got £5,000 a year for technical instruction it was different. We were able to do the thing liberally, but now the £5,000 a year is applied for purposes which really belong to elementary education.

3293. As a matter of fact, with the same funds you can do much less in the way of secondary education now than you could a few years before, because of the extra charges that have been put on higher education?—Yes, quite so—that is no doubt the case.

3294. Is it the view in your county that these facts have interfered with a complete scheme of secondary education being initiated?—Yes. If we were to sit down and count the cost of it for the last ten years we should be so frightened that we should not do anything at all.

3295. I suppose agricultural education, amongst others, suffers in the same way?—It does.

3296. That is one of the reasons why there is a stronger pressure now for further funds for agricultural education?—Yes.

3297. (*By the Chairman.*) When you end the 20 weeks' course, do they pay your fees?—They pay fees if they do not come with our bursaries. Professor Seton could say whether there are any of these students who remain with us a year who pay. As a rule the 20 weeks' course is made up of students who have got exhibitions from us.

3298. Are these exhibitions given by examination?—No.

3299. They are given, how?—They are given by nomination.

3300. By selection?—By selection.

Mr. ALFRED INSKIP, called and examined.

Mr. A.
Inskip.

3301. (*By the Chairman.*) You are Chairman of the Bedfordshire Agricultural Education Committee?—Yes.

3302. What is the constitution of the committee?—It consists of one representative from the Bedfordshire Chamber of Agriculture, one representative of the Bedfordshire Agricultural Society, a certain number of members elected by the Education Committee of the Bedfordshire County Council, and also representatives of the subscribing counties. It is not considered to be a committee of the County Council, but it makes an application annually for a grant towards its expenses.

3303. Which are the subscribing counties?—Cambridgeshire and Hertfordshire. Do you wish to hear the history of the whole institution?

3304. Can you give us the amount of the funds which each of the contributing counties gives?—I think Cambridgeshire gives £50 and Hertfordshire £25.

3305. And Bedfordshire?—The Bedfordshire County Council's contributions have varied. This year they have reduced it to £500.

3306. Then can you give details about the Ridgmont Farm School?—The Duke of Bedford adapted the buildings of the Ridgmont Farm to meet the needs of the institution and gave them to the locality, charging £1 a year for them—a peppercorn rent—for the education of 20 agricultural labourers' sons. They would not come in the first instance for agricultural education as we understand it, but to be made skilled and intelligent labourers on the farm. It was carried on on those lines till the year 1901, and was managed by what was known as the Farm School Committee, which was a sub-committee of the Technical Instruction Committee. Capital to the amount of £3,000 was advanced by the Technical Instruction Committee, and the annual average grant from that committee towards the Farm School was about £700. The Technical Instruction Committee also annually spent about another £700 on other forms of agricultural education, making the total amount of the county fund for agricultural education £1,400 per annum. The school failed to attract the lads. We found out the reason was this: That just at the time when the lads would be leaving school and beginning to earn a little money for the parents was the time when the farm school required them, and the labourers did not care to make the sacrifice of sending their children to this school, as they had to lose the wages they might earn; so that the school failed to attract the lads we required; and we found also that 50 per cent. of those who did go there left working on the farms and went to brickfields and railways and other forms of manual labour. The Duke instituted the farm with the idea of benefiting the agricultural labourers' sons and agriculture generally, but it failed. Then in January, 1901, the Bedfordshire Agricultural Society and the Bedfordshire Chamber of Agriculture were invited to appoint three members each, to confer and report to the Technical Instruction Committee as to a definite and comprehensive scheme, embracing the whole of the agricultural instruction for the county of Bedford. Their suggestions were that Ridgmont should remain a central institution and that there should be short courses held there, and that the minor arts of agriculture should be taught, that local lectures should be given with regard to farriery and dairy work, and that the advantages of Ridgmont under certain conditions should be open to other counties. This report was submitted to the Technical Instruction Committee, and by them referred to the

Farm School Committee to make their observations thereon, and they drafted a scheme on those lines, suggesting that what was then known as the Farm School Committee should be re-named the County Agricultural Education Committee, which should consist of representatives appointed by the County Council, one representative of the Bedfordshire Chamber of Agriculture, and one representative of the Bedfordshire Agricultural Society. This arrangement was approved of by the Technical Instruction Committee in November, 1901, and all agricultural education in the county of Bedford was delegated to this committee. The committee at once set to work, and appointed Mr. Walker in May, 1902, as the principal, and the short courses for the first year were pretty well attended. No fees were charged, and some of the students took both courses. Then the new Education Act was passed in 1902, which again threw the whole thing into the melting pot. The old Technical Instruction Committee was entirely done away with, and we came under the control of the Education Committee. In the spring of 1903 the Agricultural Education Committee were re-elected, and we thought that the time had come when we might reasonably charge fees, and so we made a charge of £2 for each of the five weeks' courses. We held three courses during the winter of five weeks each for men, and two courses for women of five weeks each, and we fixed upon the fee of £2 for each of the five weeks' courses for resident students, and £1 for non-resident students, and we have found although there have been fees, there has been a gradually increasing demand, and this last winter we have had 15 students who have paid the fees—some of them from other counties outside where the fee is £10 for the course. I think that is the history of the institution up to the present time.

3307. The resident students pay higher fees than the non-resident students, do they?—Yes.

3308. Are they limited to the sons of farmers or labourers of the three contributing counties?—Those who pay £2 must reside in the county of Bedford, and anyone can come from anywhere who will pay £10. It is open to anyone who pays £10 because the county is no loser thereby.

3309. Those who belong to the contributing counties pay a small fee and those who are non-resident must pay for the whole course of education they receive?—We give the contributing counties certain rights. There are so many places, according to their contributions, in these courses.

3310. Then the old idea that it was intended for labourers' sons has been abandoned?—That has been entirely abandoned. We do not teach labourers' sons now. Our main students are farmers' sons or those young men who wish to take up farming as a profession.

3311. Therefore the experiment to make the institution useful for labourers' sons has failed?—It has failed entirely. That is admitted on all hands in the county—even by those who tried it.

3312. Then do you send out lecturers in the county?—Not so much as we did a year or two ago. I think as to what the lecturers had to convey, there is not a demand for it at present. When you have delivered a certain course of lectures on certain subjects, there the matter ends and you do not want to hear the same thing over again. I think the lecturer a few years ago did his work, but he is not so necessary now as he was then.

3306a

3306b

Mr. A.
Inskip.
14 May, 1907.

3313. Do you consider that he is less necessary now to the agricultural development of the county?—Yes. That is, we used to give lectures on bee-keeping and we used to give lectures on dairying and lectures on various things of that sort, but now we think it better to give them the practical information on these things at Ridgmont or at any local course rather than by a lecture. Instead of lecturing on bee-keeping now we have the bees and we have the lecturer there to explain the whole thing.

3314. And you have what you call local classes?—Yes.

3315. But are those local classes taught by the staff of the Ridgmont Institute?—Yes.

3316. What do these classes involve—how long is the course in the local class?—It depends on what subject is taken in hand. We have local classes now in shoeing, and we would take four or five centres in the county and would have four or five nights, one night each week. We have a trained blacksmith to teach shoeing and also a veterinary surgeon to lecture on the anatomy of the horse's foot, and give the students instruction in that way.

3317. Are those lectures well attended?—Yes.

3318. By farmers' sons?—No, they would not be attended by farmers' sons. The farriery classes would be composed of young men blacksmiths—young shoeing smiths in the county.

3319. Are all veterinary lectures attended by farmers' sons?—The veterinary instruction is given at Ridgmont in connection with the short course, and that is how the farmers' sons avail themselves of it.

3320. Are those classes limited to farriers?—To anyone who wishes to learn shoeing.

3321. Is that the only local class?—We have classes in sheep shearing as well.

3322. Are there any local classes for dairying?—There have not been any for a year or two. We have not given them lately because we have the Central Institute at Ridgmont which carries on two classes for five weeks each during the summer time, to which people can come.

3323. But do you wish further development to come to these local classes?—Yes, I think we might extend in that direction.

3324. Are those local classes given in the contributing counties—in Cambridgeshire and Hertfordshire besides in Bedfordshire, or only in Bedfordshire?—Only in Bedfordshire.

3325. You think that the Government grant should be increased?—We can see various ways whereby we might improve matters, but we are stinted as regards means. I remember a short time since that the county of Bedford used to vote under the old Technical Instruction Committee £700 to the Farm School, and £700 was spent on other forms of agricultural education, that is in local lectures and such like, but now the total money found by the county of Bedford this year is only £500. That is the amount that has been voted, and on that we have run the institute, and find all other forms of agricultural education for the county. That is the great difficulty we have to contend with, and unless our committee had been very careful with regard to organising its work and trying to make the work pay we should have been obliged to curtail our work considerably; and it appears to me if a scheme can be arranged whereby an increased grant from the Board of Agriculture could be given in such a way that the County Councils could not take advantage of that and reduce their grant, we might be helped. Some *pro rata* arrangement might be made.

3326. Of course you wish the grant of the Board of Agriculture to be supplementary to the grant of the counties?—Yes.

3327. But not a separate thing?—I look at it in this way. They have knocked our grant down this year. We had £700 and it was proposed that it should be £600, but they got it down to £500 and we have a grant of £100 from the Board of Agriculture. Now I do not think it fair that the County Council should take advantage of the help the Board of Agriculture chooses to give, but that is what the county of Bedford is doing.

3328. (*By Lord Belper.*) With regard to what you have said, you say you have got only £600 towards the Institute from the Bedford County Council?—£500 this year.

3329. I should like to ask you a question on that. Here is a report in my hand which is the annual report of the distribution of the grant to agricultural education, and it is stated that the county of Bedford grants £1,166

to the colleges and the schools, and in a note to that it states that the institution which they grant to is the Ridgmont Institute, to which they give £801. Is that a different year from the year you are quoting?—Yes. I am giving you our last one, for May—this month. The County Council meeting was held on the first week in May. We made an application, and I have before me the written application which I will hand into the Chairman. We made an application for £600. We thought we could run on that because we knew ever since the Act of 1902 a higher education rate had been levied, and the county looked very much askance at Ridgmont as being partly responsible for that three farthings rate, and so we try to run it as closely as we can. We asked for £600 but it has been knocked down to £500.

3330. You asked for £600 for the coming year?—Yes, for 1908.

3331. Then it has been reduced in two years from £801 to £500. For the year 1905-1906 you got a grant of £801 according to this book, and that year that you have spoken of is 1907-1908?—That is £500.

3332. That has been reduced since 1905-1906 from £801 to £500?—I do not know how these figures in this book before me are got at, but this is probably the amount actually spent in that year.

3333. But it states here the grant to the colleges and schools is £1,166, and in a note it says that Ridgmont Institute got £801?—That would probably be the total amount spent, because last year we got a grant from the County Council of £600. The year before that we had not one penny. We were working on our accumulated funds the year before.

3334. Then do you suggest this is wrong?—I should say these are not the actual amounts. This amount is not the actual amount that was voted by the County Council, I should say, but the actual amount of the money spent in one year or another has come out of the County Council, but not for that particular year.

3335. The heading is "Grant to the Colleges and Schools"?—Yes.

3336. (*By the Chairman.*) However, I think you might send in a statement, and you had better look into this and then you can write to the committee when you have looked into it as to whether these figures are not accurate, and whether they ought to be amended?—But I should like to clearly understand what it is you wish to settle, because I think I can give the actual amount the County Council have voted for my committee during the last three years. I think the explanation is that this is the amount spent for that particular year.

3337. It says the grant?—It has been granted, only not granted in that particular year. If you go back I think we can explain it. This year we have got £500 granted; the year before £600; and the year before, nothing. The year before, I think it was a considerable sum—something like £1,200, but I am not certain of the amount.

3338. Will you then hand in a statement on this subject?—Yes.

3339. And you will see that the statement is accurate?—The actual amount expended?

3340. As to the grant received and as to the actual amount spent?—I can give you the actual amount.

3340A. But you had better give us that afterwards when you can look into it at your leisure.—[*The Witness subsequently forwarded to the Secretary a statement showing year by year the County Council grants to the Agricultural Education Committee. The total of these grants was slightly greater than the total of the amounts expended as shewn in the Annual Reports of the Board.*]

3341. Now I want to ask you a question about field experiments. Are any field experiments carried out?—Yes, we have carried them on for three years, I believe. They are of great interest to the agricultural community. We have had experiments on potatoes, and different manurial experiments with regard to potatoes, and the varieties of potatoes, and varieties of beans and oats and wheats, and we have the report printed at the end of the year, and any farmer can have one who applies for it. I have copies of two of them here. These were printed, and there has been a great demand for them. I think the whole lot were distributed.

3342. Then experiments are appreciated by the farmers, are they?—Yes, I think that is one thing that is more appreciated than any other part of our work.

Mr. A.
Inskip.
14 May, 1907.

3343. After the experiments have been made lectures are given on the subject, are they?—No, I do not think so. Lectures have not been delivered on those subjects at present. Those reports and summaries of them have been circulated in the county, and I believe Mr. Druce has given an address on those matters at the Chamber of Agriculture meetings in Bradford.

3344. Do the farmers apply for explanations with regard to these experiments?—I think Mr. Druce will answer that question better than I can. I have no means of answering it.

3345. Then the attitude of the farmers towards the Ridgmont Institute is now favourable, is it?—It is getting more favourable. They do not view with any favour the institution as such, but with regard to the work it does in conducting experiments and in giving these classes in farriery and in sheep shearing and in agricultural arts, they appreciate it. We are trying to give teaching in ploughing. We have an annual ploughing match, and that is very popular. Anything in that direction they appreciate, but up to the present I am afraid they do not appreciate so much as we would wish the institute as such. Yet, on the other hand, we are bound to admit that some one appreciates it. The smaller class of farmers, it appears to me, do, because although we charge a fee now, whereas before we charged none, our pupils are increasing. So that it shows we do supply a want and that it is appreciated.

3346. Do you say that the smaller farmer appreciates it more than the larger farmer?—Judging from all the facts of the case, I am driven to that conclusion. As I go about amongst the biggest farmers they speak of it disparagingly, but the fact remains that we get pupils. The bulk of them come from the small farmers, and from people desirous of commencing farming, but some come from the big farmers.

3347. Do they send anything like manure to be analysed in your farm?—No, we have no means of doing that; we have no laboratory.

3348. You do not do anything in that way?—No.

3349. (*By Lord Barnard.*) I find a rather useful paper inside this report which you have handed in on the administration, which appears to show that the committee of management is a little larger than what you have informed us. In addition to 10 representatives of the education committees, one of the Bedfordshire Agricultural Society and one of the Bedfordshire Chamber of Agriculture, there are two appointed by Buckinghamshire?—I said members of the contributing counties, I think.

3350. Yes, but you did not tell us of Buckinghamshire. You never mentioned Buckinghamshire?—Because Buckinghamshire does not contribute now. What year is that?

3351. I do not know.—They have joined Reading.

3352. It is 1904 and they have gone off, have they?—Yes.

3353. Cambridgeshire and Hertfordshire stay on?—Yes.

3354. Then Cambridge University you did not mention?—I overlooked that.

3355. They still have representatives?—Yes.

3356. Then this committee, apparently, do two things. They run this Ridgmont Institute, and in addition to that they do a considerable amount of other agricultural work as well in the county?—They do the whole of the agricultural work in the county that would be done by some one if there were no Institute at Ridgmont.

3357. You said just now the County Council give a certain sum towards the Institute and a certain sum towards the other work?—No, excuse me, the Technical Instruction Committee did, not the County Council.

3358. But do not go back into the past. At the present day the County Council give £500 for the current year and nothing for outside lectures at all?—No.

3359. Or any other work?—That is the total amount voted for agricultural instruction for our committee to spend at Ridgmont or elsewhere as they think best.

3360. Who acts as clerk or secretary to your committee?—Mr. Spooner, the Director of Education for the County Council.

3361. A County Council official does?—Yes, the Director of Education.

3362. Do you keep accounts?—Yes.

3363. Are they audited?—Yes.

3364. And presented to the county authorities?—They are presented to the Education Committee. The farm balance-sheet is presented and also the account of the Institute.

3365. You cannot put a copy of these accounts in, can you? Have you one?—I believe I have for this last year. Here is our report for the year. (*The same was handed in.*) Our figures for the year and our estimate for the coming year are together.

3366. That would be interesting to have. Now, about these County Council grants, how and when are they paid? Do you apply for them or do they come as a matter of course?—We apply. In the first instance a letter is sent to the Education Committee. I have got a copy of the letter.

3367. It occurred to me that a possible explanation of this sum of £801 and so on, might be that you received more than one year's grant into one year's account?—Yes, we must have done that.

3368. I thought that might possibly be so?—Yes, because for one year we had no grant whatever—not a penny was paid during one year.

3369. You told us, I think, the Duke of Bedford very generously allows you the use of the farm rent free practically?—We only pay £1 a year.

3370. There has been a good deal of money applied?—Yes.

3371. The farm consists of 270 acres?—Yes.

3372. Then practically we may say his Grace contributes a sum of £300 or £400 a year?—I do not know what it was let at before, but our farm profit was £175.

3373. Do you charge yourselves rent?—No, the committee that was formed when the farm school was given up as a farm school (the committee consisted of representatives of the Bedfordshire Chamber of Agriculture, and the Agricultural Society), they said they never expected a farm that was used for educational purposes to be run at a profit, and if it paid its own way it was enough. They go on assuming, on page 6 of the report, that it would simply meet its own expenses, but we have done more than that. Since we have made experiments we have made it pay and bring in a profit of £175 to £200 a year.

3374. You have done better than most people?—But we have had our grant reduced accordingly. If we had not made that profit we should have had either to reduce our work or get a larger grant from the County Council.

3375. You have had in addition to that £300 or £400 from the Duke of Bedford?—I do not know the amount derived from farms; I do not think from my personal experience that that land is worth even £1 an acre.

3376. Then there is the amount spent on buildings, and so on?—Yes, there is the interest on the buildings.

3377. Land is not derelict in Bedfordshire yet?—No, not much of it.

3378. Are there any other industries in Bedfordshire besides farming—important industries I mean?—Yes, Luton is a great centre of the straw-plaiting industry, and Bedford is getting gradually a manufacturing town; we are getting motor works and other works, and there is the firm of Allen & Sons.

3379. It has also a large residential population?—Yes, but it is getting a large manufacturing town as well.

3380. But there are urban residential districts besides the rural districts; but, however, do not trouble about that point. Then to come to the real point. Is it very largely an agricultural county?—Yes, that is the main industry in the county, undoubtedly. Everyone will admit that.

3381. Is it arable farming or grass farming, or mixed?—The northern part of the county is given up to ordinary farming, the eastern part to market gardening. There is fully one-third of the county which is largely market gardens, and we get a good many of our students from that district. But Mr. Druce will be able to inform you on that.

3382. An institution of the character of Ridgmont Institute would be very useful to that class of people?—That is where the practical experiments were interesting. There was a keen interest taken in the manurial experiments, and owing to the market gardening industry Bedfordshire possesses a larger number of small holders than any other county of its size. The land is largely cut up in the eastern part.

3383. What do you call the ordinary extent of a holding. Is a small holding 40 acres?—There are holdings in my neighbourhood of any size from 1 to 400 acres, but you

cannot get them always when you want them. Land is easily let.

3384. How many students can you put up in the college?—20.

3385. That is the general number actually in residence at one time?—We have had 15 this winter.

3386. Are you ever full?—No, we have never been full under the new scheme. We were full of boys. But if we were full we should find it difficult to manage. We have sleeping accommodation for 20, but the other accommodation would be cramped in regard to the dairy, and if we had a full lot of pupils we should not be able to carry on the instruction as well.

3387. You have three courses in the winter and two in the summer, and they do not take up all the year. What happens during the other part of the year?—There is nothing going on in college during the other time—not as a college.

3388. Do the students do anything in the way of farm work?—Yes, practical work.

3389. How do you get that work done when they are not there?—The labourers do it.

3390. You have labourers there, then?—Yes. The students cannot carry it all on.

3391. Is your committee sufficient to impart any information of real value?—We were obliged to go on a tentative scheme to start with. When we began it we had no experience to go by. After we started these short courses, after consultation with the farmers and others, I think we have been fairly successful considering that the farm school was very much disliked by the farmers. We started without any fees at all, and we got a few students. We found they gradually came in to it, and then we began to charge £2 for each of these five courses. The time may come when we shall see that it will be advisable for us to extend that, and I think that is what we ought to do myself.

3392. To extend the course?—Yes.

3393. To 10 weeks perhaps?—Yes, but we have got to meet this difficulty, that if we extend the course it means extra expense on the institute account, and if the County Council is in its present frame of mind we shall have a difficulty in getting the money. We could extend for the benefit of the institution and for the benefit of agriculture generally if some arrangement could be made whereby the Board of Agriculture and the County Councils could work together to help us, and one would not take advantage of what the other does.

3394. You would be, perhaps, favourable to the opinion which, I think, was expressed before that the policy of the Board of Agriculture might be to help those who help themselves, and proportion the Government grant to the County Council grant?—Yes, something of that sort ought to be done in my opinion, because I cannot help thinking that if I could have presented the case a fortnight ago, when the Council met, saying that if they reduced our grant to £500 the whole thing must absolutely collapse, they would not have done it but have given us the £600. That shows that the County Council have taken advantage of the grant from the Board of Agriculture.

3395. For how many years have you had a grant from the Board?—I think it is the second year.

3396. Most of your students go in for agriculture in some form or other, or some like industry, do they not?—75 per cent. of the students who have been in our institution under the new régime have gone on to the land in England.

3397. What is the average age?—I do not know the average age.

3398. Do any of your students go on to the Universities or pursue their agricultural studies?—No, that is what I want them to do, but we have not got the means. We have got some smart lads—one or two that come up who would be glad to go on to Cambridge, but they cannot do so. If I were to suggest spending money in that way I do not know what would be the consequence.

3399. The facilities for enabling the really clever boy to pursue his education to his own advantage and that of the county generally, do not exist in your county?—No, I am sorry to say they do not. Till there is some system of interlocking the grants I am afraid there never will be, or until there is some mode of working the County Council grant and the Board of Agriculture grant together.

3400. (By Mr. Acland.) What would happen if you were to decrease your institution? What part of your work will you have to curtail?—I am of opinion that rather than let us do less than we do now the County Council will

just keep us alive, but they will not allow us any power to expand. But if I did go to them and tell them that my committee would have seriously to consider retrenchment, I think they would come to the rescue. That is only an opinion, but, so far as I can gauge, the feeling in the county generally is that. If we were driven to the worst I should not know where to draw in.

3401. Do you think that the objects connected with secondary education on which the County Council are presumably spending their money are very necessary objects for the county?—Yes, but I am bound to admit that in regard to the money that used to be spent under the old Technical Instruction Committee, the “whisky money” that is, before the Act of 1902 was passed, which, under the Higher Education Scheme depends on the rates in part, we used to get £1,400 for agricultural purposes from the county of Bedford, but now that money is gradually being absorbed by other branches of education, because they are more clamorous for it. They know that technical education is good for them, and they want it, and the farmers are quite willing for the money to go that way. It seems to me absurd to neglect their interests.

3402. Do you notice a lack of general education in the students who come to you, or do they come well prepared to take advantage of the instruction given?—I could not say. Mr. Druce will answer that, I think.

3403. (By Mr. Staveley-Hill.) I understood, in answer to Lord Belper, you said that you issued at the end of the year the balance sheet given in your account?—Yes.

3404. Owing to that you looked upon it as a somewhat unfortunate event, because you lost some grants by it which you would otherwise have had?—It appears to me that, as a committee, if we were to act carelessly and mismanage the farm and make a loss, instead of lessening it the County Council might make us a bigger grant.

3405. You have got a farm of 270 acres, which is worth £1 an acre safely?—That is probably so.

3406. Then if you charged your rent you would have a deficit?—Yes.

3407. And you would have been able possibly to realise that aspiration as to the grant?—No. I think those who are on the County Council are artful enough to know something of what we actually have.

3408. If you did write that off, it would show a deficit?—Yes, but we are obliged to show our actual balance, and they would say “But you have got it—there it is, and while you have got it we will not vote you any more.”

3409. In your Institute to-day you have women pupils as well as men?—Yes.

3410. Do they come to learn poultry management and dairying?—Poultry management, the bottling of fruit, and dairying.

3411. At what time of the year?—April and May, and in regard to that we have a great demand for those courses. We get full up every time.

3412. Now with regard to your instruction, you appear to give instruction in farriery?—Yes.

3413. And in veterinary hygiene?—Yes.

3414. Throughout the county?—At Ridgmont.

3415. At various centres, or only at the college?—The farriery classes are throughout the county in different centres.

3416. And the other, where?—At the Ridgmont Institute alone. In regard to the young men's school you will find a syllabus.

3417. Do you find that these farriery classes and lectures given by the itinerant lecturers are well attended?—Yes, as a whole, and we have a competition at Bedford in connection with the Agricultural Society for the students who have been through our classes, and we offer prizes.

3418. Do you find that many farmers of the county or the contributing counties of Cambridgeshire and Hertfordshire apply to you as the result of the experiments, or to obtain some knowledge of farm work and experimental work?—Mr. Druce could answer that question, because he has the whole lot of these reports, and they are distributed where the demand comes from. I believe there is a demand for them.

3419. Then I see from the report here you have something in the nature of instruction in hedging and thatching, and so on. That is for those persons who only attend during the day, is it, who are not resident pupils?—Yes. We have been trying to get up some form of instruction in

Mr. A.
Inskip.

14 May, 1907

Mr. A.
Inskip.
14 May, 1907.

that kind of work for some time past, but we have found considerable difficulty.

3420. What is the difficulty?—Unless education is actually imparted, no money can be granted out of the education fund from the County Council, and our difficulty has been how to impart this particular class of education. I think we have solved it with regard to ploughing. We invited applications last year from those who wished to enter the ploughing match, and then we have sent an instructor round to that farm previously to teach them to plough, and we go to the extent under this system of imparting instruction with regard to all that is interesting to farmers and their practical needs. We find that is where his interest lies, and if we could teach thatching it would be more interesting. He is more interested in the education of his man than of his son at the present time.

3421. (*By Lord Moreton.*) As to farriery teaching, I understand that you have a competition?—Yes.

3422. At your County Shows?—Yes.

3423. Do all the people have to go in for that, or is it only voluntary?—They are optional. There are five prizes offered for these who have attended the classes during the season.

3424. Then have you any form of examination at the end of the class? Is your class subject to an examination, or is there anything to show the quality of the work?—Yes, we have that.

3425. Is that annually held under the auspices of the Worshipful Company of Farriers?—Yes.

3426. Therefore such examination as there is is held by an outside body?—Yes, any one of our pupils can present himself for examination for their certificate.

3427. And therefore am I right in thinking that such examination is held by an outside body?—Yes.

3428. (*By Mr. Latham.*) I cannot help referring to your speech made at the Farmers' Club, because from that I came very strongly to the conclusion that Bedfordshire was very much against scientific education?—I will tell you what I think is the cause of it. The farmers never took to the farm school, and the Institute at Ridgmont got a bad name through that. I think that is partly responsible for their antipathy to Ridgmont.

3429. If you gave it a fresh name would that remove the opposition and overcome their neglect?—I think it would make a difference. That is purely the cause of it—anything in connection with Ridgmont is bad, they say. That is the idea that is abroad.

3430. Supposing you gave it a fresh name, what name would you give it?—We shall break the prejudice down in time.

3431. But what would you call it? Would you call it a college, because some people seem to think that farmers trained at colleges are no good?—Yes.

3432. They think that the practical man is a long way the best in agriculture?—That is the general idea.

3433. Do you think it would involve a great deal of trouble, even with the assistance of Mr. Druce, to break that prejudice down?—I think we are gradually breaking it down—I am satisfied we are doing it. We are slowly overcoming the prejudice. They begin to see, by our experimental work and in other ways, that there is really some good being done, and the fact that we get pupils also shows the prejudice is breaking down.

3434. You said last year that the committee are convinced that the Agricultural Institute are giving good instruction over a large portion of the county?—Yes.

3435. Yet you still stick to it that it was very far from being a success?—No, I have never admitted that our college is not a success. I say it is not popular, but it is doing good work, and in time I think by our good work we shall make it popular.

3436. To return to this balance sheet of yours which I, as an agriculturist, cannot understand. First of all you show receipts and expenditure?—Which balance sheet is that?

3437. The balance sheet for 1906 of the Ridgmont Institute. You say there is so much of receipt and so much of expenditure, and you treat it as though it had been your own?—Are you referring to the farm account?

3438. Yes. Is that the right way to deal with property that does not belong to the college?—But everything belongs to us. The County Council made a capital grant of £3,000.

3439. I perfectly understand that, but who pays the

County Council tax on the college?—I do not know—probably the Duke.

3440. It must be paid, and if you do not pay rent you should show the rent on one side and the gift from the Duke on the other side, because otherwise it is not a proper balance sheet?—We do not know what the rent was or what rent to charge.

3441. It is very difficult to make a balance sheet in agriculture on these lines, so far as I know?—We put the rent down as what it is. It is £1, you will find there. The actual rent is £1, and you will find it put down as £1.

3442. Where?—On one side or the other of the balance sheet.

3443. I cannot see it. But taking Bedfordshire as a County, as we must take it for the purpose for which we are here, is £1 an acre a fair price for land in Bedfordshire?—Some land is worth five shillings an acre and some land is worth £6 an acre.

3444. You know as well as I do there is a very great industry in Bedfordshire in growing onions, and the land so used is not let at £1 an acre?—I am in that industry myself, and I should like to get it at £1 an acre.

3445. Land in Bedfordshire would not be fairly reckoned at £1 an acre in the North?—I do not know about the North. In the East it is considerably more.

3446. You are Chairman of the Agricultural Committee?—Yes.

3447. What did they do with you first of all when the "whisky money" first came out?—When was that, may I ask?

3448. That was some time ago. What was the last money you ever had from the County Council Committee before then?—We used to average £700 a year for the Institute and about £700 a year extra used to be granted. Our maximum would be about £1,400.

3449. If I have not made a mistake, at that time Bedfordshire stood as high as most counties in giving assistance to agriculture?—I am not able to make a comparison. I do not know. I was not chairman at the time.

3450. From the County Council, that is?—I should think they did at that time.

3451. Then the loss to the county is very serious in consequence of secondary education taking the place of agriculture, is it not?—Yes, that is my opinion. They have gradually appropriated more money to other secondary education in the county.

3452. What is the secondary rate in Bedfordshire?—Three farthings.

3453. And the Board of Agriculture is giving you £100, is it?—Yes. They came to me first, I think it was last year or the year before, and they said "We shall have to make the education rate up to a penny unless we economise, and your committee will have to be docked so much—you can work on that." I was bound to admit that we had a little money in hand. We could do it with the farm profit; so that we were docked in order to help save the higher education rate, and that is the policy that is pursued all the while.

3454. Then virtually, without the Duke of Bedford, you must stop?—Yes, he could stop us at any time and give us notice to quit.

3455. That is not what I mean—that is a very different question. I mean that without the help of the Duke of Bedford agricultural education in Bedfordshire must stop?—I do not know what the county would do if he were to withdraw all his help. They want to spend as little as they can on it, but if they were put into a corner I do not know what we would do.

3456. I quite see why you answer my question in that way, but that is not what I want. The Duke of Bedford is of such assistance to the County of Bedford that if it were not for him in all probability agricultural education in Bedford would stop and you would lose your farm?—Yes, there is no doubt he has done a good work and is a great aid to agricultural education in the County of Bedford, but what would take place if he were to withdraw his aid is beyond me. I cannot exactly say.

3457. Is it possible that the County Council would then take into consideration the matter of agriculture?—I am afraid it would let Ridgmont as an institution go. But that is only an opinion. I do not know.

3458. We need not stop at the County of Bedford. The Duke of Bedford has been a great acquisition to the agriculture of England, has he not?—Yes.

Mr. A.
Inskip.
14 May, 1907.

3459. From the speech of yours of which I spoke I was very much impressed with the idea that it was no use to expect the farmers to go to education, and that you would have to take education to the farmers?—That is the policy we are trying to pursue.

3460. Just explain that, please, because that is something new?—The idea was to take these classes in sheep-shearing and farriery classes and then teach ploughing to them.

3461. I want to deal with the better education of the farmer. How are you going to take it to him without him coming to the college? Will there be more scientific teaching of the agriculturist, I mean, because I do not quite see what you mean by your remarks here in this speech made in March, 1907, at the Farmers' Club?—The question is rather a difficult one to answer. The only way in which we could do it would be by doing what we did in times past, that is by sending scientific lecturers round to arouse their interest by their speeches on agricultural education.

3462. When you sent the lecturers round did you find the lectures well attended by these farmers?—In some place they were very well attended and in some places the attendance was very meagre, and I do not think they got more popular as time went on. I mean they seemed to know more what to expect. There is no doubt that as the result of the lectures which were given in the county previous to the institution being started on the present lines we got some of our pupils. If it had not been for the lectures that had been delivered on agriculture generally throughout the county, we should not have got the pupils we did, when we charged no fee at all. They did their work and by their means we got pupils to the college that we should not have got if they had not previously broken up and prepared the ground.

3463. Among the very first steps in education by the County Councils was the institution of dairy schools, and were they taken up very favourably in Bedfordshire?—Do you mean travelling dairies?

3464. Yes?—Yes, they were taken up very well in Bedfordshire.

3465. From my own experience of them I should say you originally made very bad butter, and has it improved now?—I am not a butter expert, but I should be glad to see you come down to Bedford and taste some of it.

3466. I come every year?—Will you go to Ridgmont and try it there? We get a good character for good butter there.

3467. You said some pupils were the sons of farmers and some were the sons of persons who wished to take up farming. Who are they?—There are certain people in Bedford who are not farmers themselves but who want their boys to learn farming, and so with other parts of the country. We get a few of that class, but very few. Out of the fifteen we had this year there would be three or four of them come from good-sized holdings of 300 to 500 acre farms. Then there would be nine or ten come from smaller holdings right down to the very small holdings.

3468. But my point is that you made the remark that they were the sons of men not farmers, but who wished to become farmers. They were not agriculturists, and I ask, are they auctioneers or surveyors, or what?—The son of one was an employee with the Midland Railway Company—a collector. But Mr. Druce could answer those questions better than I. He could give you definite facts in each particular case.

3469. You made the remark just now that your lectures were barely successful, and have they been discontinued?—Not altogether discontinued. We employ Mr. Druce, who is the Principal of the College, in lecturing in Bedfordshire.

3470. What were those lectures on?—Various subjects in agriculture, such as the chemistry of manures and lectures on soils.

3471. Did you take up research at all?—No.

3472. Is there much scientific work done at Ridgmont?—No, not scientific work.

3473. It is principally work of a practical nature and character, is it?—Yes.

3474. You mentioned your shoeing classes just now. Do

the owners of horses who are not exactly agriculturists feel that it has done them much good by teaching better shoeing, because there are a great many people who use horses who are not agriculturists, and they have to have their horses shod?—I hear these things well spoken of, and that it is a good thing. They seem satisfied that their horses have been better shod.

3475. They think the work has done good?—Yes.

3476. Now with regard to Luton, I know very well the straw-plaiting industry, but that has very much gone, has it not?—It is booming.

3477. Is it?—It is booming. If you go by you will see new factories and new places going up.

3478. Where do they get the straw from?—I do not know—some from abroad—the bulk of it I should say.

3479. (*By Professor Middleton.*) You are a farmer in the County of Bedford and have been for years, have you not?—I am a farmer's son.

3480. Have you yourself derived any benefit from this educational work which has been taken up, if that is a fair question to ask you?—I consider I have in two ways, not merely with regard to the facts that I have learnt myself from the lectures, but also by making my mind more inquisitive on the subject and ready to pick up other information. It has interested me in the matter.

3481. Then you firmly believe that even for a large farmer in the County of Bedford education is a good thing, though your neighbours do not believe it?—Undoubtedly I do.

3482. You mentioned the fact, I think, some minutes ago in your evidence that you found that grants were readily given for other subjects than agriculture, although these grants were given by farmers?—Yes. It is more easy to get through a grant for Bedford or Luton than for me to get through a grant of any size.

3483. Are the men on your Finance Committee mainly farmers or mainly others?—Mainly others.

3484. The farmers are not absolutely a majority on the County Council. They do not control the grant, do they?—No, but I find on my committee the members who are in business in Luton would support me.

3485. They are more generous than the farmers?—They are sometimes.

3486. (*By the Chairman.*) Your income is only the £500 you get from the county of Bedford, £100 from the Board of Agriculture, and the amount of the subscriptions of the contributing counties, is it?—That and our fees. I should like to give them and how we make them. We have got a grant of £500 from the County Council, and assuming we make £200 on the farm, then we get £100 from the Board of Agriculture, and £200 in fees from the students. That is £1,000.

3487. What do you get from the other counties?—Fees and contributions I ought to have said from other places.

3488. That is included in the sum of £200, is it?—Yes.

3489. When the grant was reduced I understood you to say that the County Council did reduce the grant from £600 to £500?—Yes.

3490. On what do you retrench in order to meet that reduction?—This is on the coming year, and we are not going to retrench.

3491. Then on what do you propose to retrench?—We have money enough to go on with for the present year without retrenching. I think our estimates come up to about £1,200. We shall have to retrench this year or we shall encroach on our funds that we have in hand.

3492. You have a balance on which you can draw?—Yes.

3493. How do you stand now in regard to funds?—We are coming close to the end of our tether. Unless the County Council gives us a larger sum than £500 we shall be unable, in a year or two, to carry on the work we are now carrying on, and the point I wish to make clear is that I do not want the County Council to take advantage of any help we may get from elsewhere in order to reduce their grant.

Mr. EDRIE DRUCE, called and examined.

- Mr. E. Druce. 14 May, 1907. 3494. (By the Chairman.) You are principal of the Agricultural Institute of Ridgmont?—Yes.
3495. Would you explain to the Committee the course of study in the five courses of five weeks each?—We have five courses, two in the summer for women in May and June, and three for men in October, November and January. Each course is self contained. That is the students can come for one course or more. The students are all advised to attend for the full number of courses—that is for the men to be present at the three courses in the winter, and the women to be present at the two courses. The subjects that we take for women are butter making, cream-cheese making, poultry and bee keeping, cookery, and book-keeping, and for the men agriculture, elementary science, poultry and bee keeping, horticulture (vegetables and hardy fruits), veterinary hygiene, elementary surveying and book-keeping. We give instruction on very practical lines—it is essentially practical.
3496. Are the classes well attended?—Yes. Since the present scheme has been in operation, that is since 1902, we have had 77 men and 72 women present altogether. The average age is from 18 to 20 years in both cases, and we have had a steady increase in those taking the full time and a slight decrease in those coming for only one course.
3497. You mean to say they take the five courses—the women take the full course and the men too?—Yes, and we are striving for that, we ask them to come for even only the one five weeks' course. The figures that I give here show that in 1903-1904 we had only two students taking out the full three courses for men, and for the last winter we had 13 who took the three courses. Above half the students are directly connected with the land, and of the remainder about half the parents are in trade, and the other half are of the professional class. Occasionally some of the students are from the labouring classes, but not very many come from the labouring classes.
3498. There are no scholarships at these courses, are there?—Yes, the Committee grant two scholarships to each course if they are applied for, but they will not give the scholarship unless the parents practically cannot afford to pay. The fees are very low—they are only £2 for the five weeks, or eight shillings a week.
3499. Therefore they are £6 for the three courses?—£6 for the three courses.
3500. And for women, is it the same?—It is £4, because the women can only come for two courses for ten weeks.
3501. That is £4?—Yes.
3502. Then the students who come from outside pay the full fees—they pay £10, do they?—They pay £10 for the five weeks.
3503. Therefore for 15 weeks they pay £30?—Yes.
3504. That you think pays the institution?—Yes, it covers the cost to the institution and a little bit over if anything.
3505. To what class do the women belong?—The women are mostly farmers' daughters.
3506. Any dairymaids?—No, they are mostly farmers' daughters who are going back again to work in their parents' places.
3507. Are there in Bedfordshire many factories or creameries?—No, I think there are none.
3508. To what do you attribute that?—It is not a great dairying county. There are only portions of it that are really fit for dairying. Of course all the eastern portion has very little dairying at all. We are conveniently situated on the main line of railway for London, so that any large amount of milk that is produced goes wholesale to London and is not manufactured.
3509. The export of milk is greater than the export of butter, is it?—Considerably. There is very much more of it.
3510. Then with regard to the horticultural classes, who attends those—are they agriculturists?—No, we have not any special horticultural class, but all the men students take horticultural lectures and practically work that as one of their subjects in the ordinary agricultural class.
3511. You have a number of market gardens in Bedfordshire?—Yes, a considerable number.
3512. Do not those market gardeners require special courses?—Not very much so. I should hardly say special

classes, because a lot of gardening is very much on the lines of the farming, only it is more intense; but it is very different from ordinary horticultural work. There is gardening teaching.

3513. Do you say it is the right course for the market gardener that you teach?—Yes, I think it is, only if I had many market gardeners I should give them rather more horticulture and drop entirely, perhaps, the veterinary work.

3514. Of course you would like to extend these courses, would you not?—I should certainly. I should like to have, instead of three fives, two tens, ten weeks before Christmas and ten weeks after.

3515. A twenty weeks' course?—A twenty weeks' course; and I should like, if possible, to get the best of the men that come one year to come back for a second to take another twenty weeks in the second year.

3516. Forty weeks altogether?—Yes.

3517. Then would you institute a summer course?—No, not for the men.

3518. But you would institute a summer course for the women, would you?—Yes, I should have a summer course somewhat similar to that we have at present, but rather extended.

3519. Then as to your students in 1901, 60 per cent. are on the land?—That is hearsay evidence. That is what I have been told by the staff, who have been there before myself.

3520. And several have gone to the Colonies?—Yes. Since 1902 75 per cent. are directly, and 5 per cent. indirectly, connected with agriculture and the land, that is in the nature of land agency work, and 12 per cent. on the land in the Colonies, and 8 per cent. have been lost sight of or left the land.

3521. You do not give them at the end of the full course a certificate or diploma, or anything of that kind, do you?—We give them a certificate of attendance if they have attended and worked satisfactorily. They have to pass an in-college examination set by myself and my colleagues. There are no outside examinations. If they pass that examination satisfactorily we give them a certificate of attendance.

3522. Merely of attendance?—Merely of attendance.

3523. No examination?—There is an examination, and unless they pass the examination they do not get the certificate.

3524. At the end of each course of five weeks there is an examination, is there?—At the end of the fifteen weeks, but it is an inside examination. There is no outside examining body.

3525. You examine them yourselves?—Yes.

3526. The attendance is increasing, is it?—Yes, the attendance is increasing. As you will see from the figures when we started the first year, four years ago, we had something like six students running through the winter, of whom only two stayed the whole winter, and this last past winter we had fifteen at each of the five weeks' courses, and of those fifteen, thirteen were present right through the whole winter, one was present at four classes, and four only came for one.

3527. Are they the sons of farmers?—Yes, or tradesmen mostly.

3528. Small farmers?—Large and small, but I should say a bigger proportion of them are from amongst the smaller farmers.

3529. They value it more, do they?—Yes.

3530. What do you consider the most valuable work conducted by your institute?—I think the most valuable work, and the work that will be most valuable in the long run, is giving instruction to the children of farmers, so that they will go home and put the instruction or knowledge that they get into practice in their own immediate neighbourhood. I think that is not the most showy work—it does not show at once, but that is the work that will prove the most valuable in the long run, and that is what we ought to develop as much as possible.

3531. Do any of your pupils, after they have attended your courses, show any inclination or desire to attend the higher institutions?—A few do, but not very many. I have had some, more among the women students than the

men. I have had three or four in the last six years of women students that have gone to the Kilmarnock School.

3532. In Scotland?—Yes, in Scotland. They went with the idea of taking out the National Dairy Diploma.

3533. And you encourage them to go there?—Yes, we encourage them to go there by advice. There is not any monetary inducement. We give them advice and help them as much as we can if they want it. I have had two students who would have gone to Cambridge if they had had the opportunity, but they had not the means to do it themselves, and there were no means at the county's disposal to send them.

3534. Therefore you would like to have scholarships for those who want to attend the higher schools?—Yes, I should. Of course we should be very particular about granting them. One does not want to give scholarships to anybody except to those to whom they would really do good.

3535. Then your main difficulty is the lack of funds?—Yes, I think for my own personal opinion it is entirely due to the Act of 1902, which took the "whisky money," so to term it, and lumped it with the rate money for higher education generally, and I think if we could go back to some method by which the Board of Agriculture could take from the Treasury the proportion of the "whisky money" that was spent on agricultural education before the Act of 1902 came into force, and had that money entirely, and our Agricultural Education Committees or governing bodies were absolutely independent of County Councils, and all the money that we got was simply from the Board, we should be better off than we are at present. Of course that is possibly a biggish order, and it would be almost impossible to carry it out, but I believe that would be the most satisfactory way. Then the Board could grant sums to the different County Councils, and grant them in such proportion as the Board thought fit in accordance with the work that each county did, and we should then have more inter-communication between the different counties, because whatever we did in one county to help a neighbouring county we should not be doing something with, say, Hertfordshire money to help Cambridgeshire, and we should never have it thrown in our teeth that we are simply using money coming from the country generally to help somebody in a particular county.

3536. You think that a certain amount of the "whisky money" should be set aside for agricultural education?—Certainly.

3537. And that then the Board of Agriculture should grant in proportion to that?—Yes, I think that the Board of Agriculture should have the whole of that money instead of a proportion of the "whisky money" being given to the County Council as it is now. It should be taken away from them and given to the Board of Agriculture entirely.

3538. You want to intercept it?—Yes, I do not want it to go to the County Council at all.

3539. (By Lord Belper.) You want to take away the money from the County Council which they have already got for secondary education?—Yes, but I should, of course, only take a proportion.

3540. That would not be a very popular proposal?—Possibly not.

3541. (By the Chairman.) But you would give it after it had been intercepted to the Board of Agriculture and the Board of Agriculture would give that money and its own to the Education Committee of the County Council, and you would not have the Board of Agriculture administer it itself?—No, I should have the Board of Agriculture administer it through a committee similar to what we have in Bedfordshire, which is composed of certain members of the County Council and certain elected members by agricultural societies.

3542. Therefore the County Council would be represented on the body which administered those funds?—Certainly, they would be represented, but they would not have the governing voice.

3543. What is your objection to the County Council administering the money?—Because the County Council, I think, will spend more than the proper proportion on ordinary secondary education work, and not technical work, and the proportion of the "whisky money" that ought to go, according to my mind, to technical work does not go. It goes to ordinary secondary work.

3544. (By Lord Belper.) On that let me ask what

is the advantage of taking away money which is now given to the County Councils for secondary education, in order to give it through the Board of Agriculture to a special part of that education, namely, agricultural education? All the witnesses have admitted that they want more from the Board of Agriculture, but I do not understand what is the special advantage in the Board of Agriculture taking away with one hand money which is given to them in order to give it to a special purpose with the other hand?—I think if the Board of Agriculture took this money matters would be put right with regard to the proportion of the "whisky money" that was spent on agricultural education up to the time before the Act of 1902.

3545. But surely it is hardly worth while going back to see what proportion should have been given several years ago before the system of secondary education was developed?—I think the more secondary education is developed the less money we shall get for agricultural education.

3546. (By the Chairman.) Your point is that you want the money earmarked for the purpose of agricultural education?—Certainly.

3547. And you think that can only be done by the Board of Agriculture setting it aside?—I think that would be the best way to do it. I would not like to say it is the only way, but it is the best way.

3548. (By Lord Belper.) Are you aware of the difficulty that occurred, before the "whisky money" was allowed, to be given for secondary and technical education, in distinguishing between technical and secondary education? There were constant difficulties?—Certainly.

3549. Are not those difficulties now constantly occurring?—I know that there would be difficulties.

3550. Then I do not know why you wish to return to that state of things?—This would be entirely for agricultural education. I do not think we get our proper proportion.

3551. I do not know what you call the proper proportion. It may be the proportion given ten years ago, or the proportion given now; but I do not understand the term "proper proportion." But you want more money for agricultural education?—Certainly; and I think we do not get our proper proportion of the "whisky money."

3552. (By the Chairman.) Your view is that before 1902 more money was obtained from this source?—Certainly.

3553. Since then the need for more money has been clearly shown by the development of various agricultural institutions for agricultural education?—Certainly.

3554. Therefore your point is that it is necessary that the Board of Agriculture should have the power of deciding as to the amount of money which is wanted and which should be taken from the "whisky money" in order to add to the amount of their own grants?—Yes.

3555. That is your view?—Yes, that is my view; it may be put like that.

3556. (By Mr. Latham.) You will know there are a great many counties unable to allocate any money to agriculture?—Yes.

3557. How would you treat those?—I should treat those on the same scale. If they did not like to grant some, let them go without it. As to those who did grant money before, let them go on and go ahead, and work it for the benefit of each. I do not say you can do it in that way entirely, because that is perhaps too drastic a method; but do not give them so much. I think those who have tried to do the work should get the benefit of it, and those who did not, and were behindhand with it, should be allowed to suffer.

3558. (By the Chairman.) There is at present no active hostility from the farmers, is there?—Very little active hostility.

3559. Especially the younger farmers are fully alive to the necessity of this work, are they not?—Yes; it is the older ones, that have either been very successful or very unsuccessful, who are against us, but the ones who are doing pretty well and the younger generation of men from 30 to 40 are pretty well with us.

3560. The most popular instruction is giving in ploughing and sheep-shearing, and so on?—Yes, at the present time.

3561. Would you explain to the Committee your scheme with regard to experiments?—My scheme to arrange experiments is practically based on the scheme that was issued by the Board of Agriculture some three or four years ago for all our manurial experiments. Those are the lines we work on.

Mr.
E. Druce.
14 May, 1907.

Mr.
E. Druce.
—
14 May, 1907.

Then in addition to that I have a considerable number of experiments on all the different varieties of farm crops, and the way I have worked these is to have demonstration plots upon different farms in the county. We go to the farmer and arrange with him to have certain plots on his farm. The Committee pay for the things we demonstrate with. For instance, if we were demonstrating with varieties they would pay for the seed, and if we were demonstrating with manures they would pay for the manures. The farmer does all the work and gets the crop. We have made use of a few plots during the summer time, and when we are there we explain and point out the results to the farmers present.

3562. Who pays for the manure?—The Committee pays if it is manure, and if it is varieties the Committee pay for the seed.

3563. Do the farmers come to you and ask for experiments to be made on their farms?—Not very many. I have had a few do that. They will come to me and ask for an experiment in their locality, but they would sooner have it on their neighbour's farm. But we have many of them coming and saying, "We should like experimental plots in our parish, or the next parish, and Mr. So-and-So will be just the farmer for you to go to."

3564. Then lectures are also given?—Yes. I give a certain number of lectures myself on agriculture, and we have a poultry and bee-keeping lecturer who is fully occupied now for the time we employ him.

3565. Are those lectures well attended?—They are quite well attended.

3566. There is no difficulty in securing audiences?—No; at the present time I should say we have none. We have this man, and we have applications for the man to be sent, but we do not send him unless we have an application.

3567. You could give more extension to these lectures, could you not?—We could give a little more if we had more money.

3568. Then there is the evening school for stock management in the village?—We tried that as a kind of experiment this winter. I tried that myself. It was an evening school for young lads and farmers' sons who had left the ordinary elementary school—fellows from 15 to 18 years of age. I gave them lectures and asked them to take notes and write out what I had told them on the management of stock, during the winter evenings, one evening a week. It was 24 hours altogether. We had a fair attendance. It was only a small country village, and we had about nine or 10 there, and we charged them a small fee of 6d. to start with, and certainly all those who paid the 6d. attended regularly. I set them a short examination at the end, and I got some very useful answers from them. It is a thing that might be developed and carried out in many other country villages if one had a junior on one's staff to do it. I mean it is a junior's work. It is work that should not cost a very great deal of money. If you pay a man a big fee it becomes too expensive.

3569. They were not self-supporting?—No, certainly not. The fees only came to something like 5s. or 6s. altogether.

3570. The County Council simply supplemented with the difference?—As a matter of fact, I did it as an experiment. There was no fee. It came out of my own yearly salary without any extra fees, in order that I might try it, but in subsequent years it would mean a small fee to the lecturer. Then we have not much accommodation at Ridgmont for giving scientific education. We have not any laboratory, and very little accommodation for that work, although I believe it would be a very good plan if we could do it. We get a fair number of general enquiries, but as to pure scientific points that want a laboratory to deal with, or any research work, we have to pass it to somebody else.

3571. You think more development could be given to work of that kind?—Certainly.

3572. That is if only you had the fees?—Yes, if only we had the fees and the accommodation.

3573. You say that to give instruction in manual processes is of importance?—Yes, the manual processes are of considerable importance. We have been struggling with them for some time, and I think we have settled in regard to certain divisions of it, but we have not settled it entirely. The horse-shoeing classes, which we hold at certain centres in April and May, are held at a local forge, and the teacher is a thoroughly competent blacksmith. I have got a good man in the county, but

I should think in most other counties they could find a man equally well. The pupils do the actual making and fitting of the shoes. A veterinary surgeon attends on two evenings and gives a lecture of one hour upon the construction and chief diseases of the foot. The cost is about 30s. for each meeting of the class.

3574. That is provided entirely by the County Council?—Yes. My average attendance will be, for the last two years, about nine for each meeting of each class, so that it runs to a little over 3s. 3d. per student per night.

3575. Then at the county show there is a competition or examination in farriery, is there?—Yes, and it is open to those who have attended the classes. Of course, the cost of that comes from the County Education Committee—from my own committee of the County Council. The Agricultural Society give us a small amount towards the erecting of the forge, and, of course, there is free admission to all the competitors. It helps the Agricultural Society somewhat, so that they make a certain amount which goes towards expenses.

3576. Then you have a class in sheep shearing?—We have a class in sheep shearing. We had it in past years for hand shearing, and in the last two seasons I have had it entirely for shearing by machinery. I send a competent man round to give instruction. The class meets on three consecutive days. A grant of 2s. 6d. each is made to not more than 30 pupils, provided they produce a certificate from their employer that they are working for a weekly wage and are regularly employed.

3577. That is provided by the County Council?—It is provided by the County Council.

3578. Then as to ploughing?—A ploughing match is held, the entries for which close early. After the entries have been received a competent instructor is sent round and he spends a day on each farm from which entries have come, and instructs the entrants whilst at their work. Then a competition comes afterwards, for which there are money prizes, all the expense of which comes out of the County Council.

3579. Then you think that the farm could be made of more use?—I do think so. For breeding first-class animals and for growing valuable seeds for sale to people in the county at a reasonable figure. Of course it is largely from lack of funds that one is prevented from doing more, because there are not funds to start the thing. Also, I think we ought to do more than we have done up to the present to assist and develop agricultural co-operation.

3580. You think agricultural co-operation should be extended?—It should certainly be extended, but as to how we are to help that and do it, I could not be certain as to the best method. But whenever any official has an opportunity of working in this way, he should do what he can to help agricultural co-operation. I know in our own county we started a society some five or six miles from Ridgmont, at a place called Clophill, within the last two years, and we have had some demonstration plots for them, on potatoes, that were run by that co-operative society. They took a piece of land at a low rent from the landlord, Lord Lucas. I gave the results in figures, and they published the results themselves, and distributed them amongst the members. We had a large number of their members looking on and coming round every week to see how it was going on.

3581. The members of that co-operative society were farmers, were they?—Farmers and market gardeners, and some labourers.

3582. And the results were satisfactory?—Very satisfactory.

3583. And that will go on, will it?—That will go on. They are taking it on again this year now. Of course we have only got the one co-operative society in the county at present, but if there were others I should make the same suggestions to them.

3584. And work them on the same lines?—And work them somewhat on the same lines.

3585. (By Lord Belper.) I do not quite understand your co-operative society. Is it a scientific society for co-operative farming?—No; it is an ordinary co-operative society.

3586. But there are so many different classes of co-operative societies, and that is what I want to find out?—It is one of the co-operative societies working in conjunction with the Agricultural Organisation Society for the disposal of their produce and the purchase of their requirements. They thought that it would be a very good thing for their members to have information about manuring potatoes, and

Mr.
E. Druce.
14 May, 1907.

so they had a committee appointed, which took a portion of the allotment land in the parish from the landlord, and the co-operative society asked that it should be done, and I conducted the experiments on the land, and these are going on now.

3587. I did not quite understand your suggestion that you considered it desirable that the county authorities should assist the development of co-operation. I did not quite understand how growing potatoes would develop co-operation, and I do not quite see it now. It is quite true you encourage good farming in the way of growing potatoes, but I do not see quite how it develops co-operation?—I think it develops co-operation in that the men see it is a good thing to have demonstrations or experiments in their localities. If they had not combined they probably would not have had them, and they would not have learnt the lessons.

3588. But that is a very indirect object in connection with agricultural co-operation?—Yes, it is only a branch subject.

3589. (*By Lord Barnard.*) It is, I think, well known that the gentleman whom you named just now, Lord Lucas, is a very enthusiastic supporter and promoter of agricultural co-operation, is not he?—Yes, he is.

3590. Do you not think it would be rather extending the operations of higher agricultural instruction to ask that the development of co-operation should be included amongst its operations?—No, I do not think so. You say take higher education in that way, but I reckon we do not do enough for what we might call lower agricultural instruction. There is plenty done in the higher work with collegiate centres, and so forth, but it would be only in the smaller centres and county authorities, I mean amongst the smaller people.

3591. I gather you think the funds provided by the County Council out of the "whisky money" and by the Board of Agriculture might usefully be utilised, amongst other things, for developing agricultural co-operation?—Yes.

3592. That is your opinion?—Yes, that is my opinion.

3593. Then I should like to ask you a question on another subject which you have just mentioned to the Chairman. You think another object for which the same fund could be utilised would be where there was a farm school, as in your place, for breeding first-class stock. Would not that be enormously costly, in the first place at any rate?—Yes, it would.

3594. Then would not you agree with me in thinking that would be rather outside the sphere of a central or county authority, and rather a matter for individuals?—I think when it is a matter for individuals or in the case of a few men, certainly they would do it, but with a large number of men who put a good deal of capital into the thing they want a big result. With authorities, if they got a reasonable return for the money invested, and kept it together and it gave a return in the value of the animals of the people in the county, I think it would be better for the county.

3595. Then you would not agree with the suggestion that in my opinion such work was more suited to an agricultural society and other associations which did not receive public money?—No; I should like to work in conjunction with agricultural societies, possibly, but I think that it is an object which public money could very well be spent upon, the same as it is in Ireland.

3596. You have a staff of some six or seven officials, and do they reside on your premises?—No, only two reside on the premises. Only the matron and myself are permanently there.

3597. Where is Ridgmont, about?—It is on the line between Bletchley and Bedford on the North-Western. It is about 4 miles from Ampthill and about 2½ miles from Woburn—it adjoins the Royal Agricultural Society's farm.

3598. What happens to the staff during the interval between the courses?—My own time is fairly well occupied, and the matron and dairy teacher, who has the house to look after, has her time fairly well occupied. The assistant dairy teacher is only there for 12 or 13 weeks in the summer, and then there is a 10 weeks' course. My science lecturer is only appointed for six months from the beginning of October for 26 weeks, and the other portion only come on certain days in the week. They are not employed the whole of their time.

3599. They do not receive full annual salaries?—No, certainly not.

3600. It struck me the cost of your institution was rather low?—Yes, the salaries are in proportion to the work.

3601. Have you a free hand, or do the committee control you to a very large extent?—Not very largely.

3602. I should like to ask you what sort of an amount of previous education your students have had in the county?—The majority of them have been to a secondary school, a very large number of them have either been to the Bedford Modern School or to the County School of Bedford or to the Grammar School at Dunstable. Of course a large number of boys in Bedford go to the Modern School.

3603. Dunstable School is an endowed school?—Yes.

3604. And Bedford School is another?—Yes.

3605. So that Bedford is exceptionally situated as to education at the cost of previous generations in regard to secondary education?—Certainly.

3606. Do you consider the pupils when they come to you have been sufficiently well educated to take full advantage of the instruction you can give them?—Yes, I think so.

3607. Then you say you think your courses are too short?—Yes.

3608. You would like to have them longer?—I should like to have them longer.

3609. Is there any compulsion to follow the whole course when a student comes, because I see it is stated in the Government Report that some only come for a portion of the five-weeks' course, and that must be very short?—The figures mean the total number of students we had. But there are a certain number of girl students who come for one summer and take the 10 weeks out, but they would likely come back in the following year and get rubbed up a little in their work, and that would mean those.

3610. You do not insist on a student working for full five weeks?—As a fresh one I would, but not an old one coming back for a few days. We should let them come for a part of the time.

3611. You have said that at the conclusion of the 15 weeks you tested the students by an examination. Therefore, those who go at the end of the first five or ten weeks are not tested at all?—No, they are not.

3612. I think a few of your students go on for higher education?—A few of the girl students have gone, and a few men would have gone, only they have not been able to afford it.

3613. In your opinion you think that in Bedfordshire there is not sufficient provision made for enabling clever boys, or clever girls either, to get further instruction?—No, there is not.

3614. It would be a good thing if there were?—Yes; I think if there was a chance of some scholarships to Cambridge for the boys, or for Kilmarnock, or one of the big dairy schools, for the girls, it would be a great advantage.

3615. You state that a great proportion of the students are children of farmers?—Yes.

3616. Is it to educate sons of farmers, or those who wish to take up agricultural pursuits in after-life, because there is a great difference?—It is to educate those who are going to take up agricultural pursuits in after-life.

3617. Irrespective of what their parents may have been?—Certainly. Some are children of tradesmen. Of some of those who have come the parents may be tradesmen, but the child may want to go in for farming.

3618. You have practically told us, then, your County Council does not do all that it might do for agricultural instruction, because it does not give sufficient provision for higher agricultural instruction?—Certainly.

3619. Now is not Cambridge very easily accessible?—You can easily get to Cambridge.

3620. Would it not serve the purpose of the county, in your opinion (because it is entirely a matter of opinion), if arrangements were made by which students could go to Cambridge?—Certainly it would. Cambridge is the most convenient centre for us.

3621. I do not propose to follow you into your proposals for the appropriation of the grant entirely, because I must confess it evoked some astonishment on my part; but I think one of the members of the Committee drew attention to one fact on which I was going to ask you a question, and that is as to why you should take the year 1902, because in some counties they have done nothing, or very little, in 1902. Do you think that such a system as that would promote the general development of agricultural knowledge

in the country?—Yes, I think it would, because, if you take 1902, the “whisky money” had been given some eight or ten years, or eleven years. It was in 1891 or 1892 when the first grant was given—1891 I believe—and it had been given some ten or eleven years in those counties that had been developing pretty well up to their utmost the “whisky money” in that period of eleven years, and I think if you look back to the year 1902 there were very few counties that were not doing a very great deal for agricultural education, and those that were doing very little then have certainly not done more since.

3622. Then you will perhaps agree with me that if a grouping of the counties could be made for the purpose you would still like to keep all those counties in watertight compartments, and the counties who had once done nothing should for all time do nothing?—No, not quite. Those are too hard and fast lines. I do not want watertight compartments, but I should like to take the country as a whole, so that we could take a boy from Hertfordshire without the Bedfordshire County Council saying you are spending money on a Hertfordshire boy.

3623. Then would not you agree with me that money received from the State might be applied for the purposes of the country at large?—Certainly.

3624. Even though it was necessarily applied through the medium of one particular institution?—Yes, certainly. I quite agree with you there, but as it is now, if your money comes from the rates (and a certain proportion of it does come from the rates) it is very difficult to differentiate what comes from the country and what comes from the ratepayers.

3625. (*By Lord Belper.*) Were you in the room when the last witness gave evidence?—Yes.

3626. Could you clear up a point I asked about, as to the figure in this book of the £801 grant?—I am afraid I cannot.

3627. At all events I suppose it is a fact that your Council is giving less money now for the purpose of your college and agricultural education than they were giving some years ago?—Certainly.

3628. And that really is the cause of your wishing to transfer it from the County Council to the Board of Agriculture?—Yes. To a great extent I think the Board of Agriculture would be a better body to give it. They would be more in touch with the people carrying out the work.

3629. It would make no difference to you whether the Board of Agriculture acquired this money by grant from the Treasury or whether they got it by taking away money that had been already given for other purposes to the County Council?—Certainly not.

3630. Not at all?—No.

3631. All you are anxious about is to get as much money as you want to get, and as long as you can get it through the Board of Agriculture, which you say is in touch with your work and able to judge of it, it comes to the same thing as to where you get it from?—Yes, except that one does not know quite what the idea of that money when first given to the County Council was. I believe it was meant to be applied to a certain amount of agricultural work, and that it should not be devoted to other things.

3632. Are you aware that that money was not devoted to agriculture when first given, but was given for the purposes of technical education generally, and that the authorities had full power to give it according to what they thought the interest of their county, either for agricultural education or for other technical education?—In a purely agricultural county?

3633. Quite so, but I am quite recognising what your experience is in your county, and therefore that your evidence is largely given on your own experience?—Yes, certainly.

3634. But you think that where another county comes in, where the experience is exactly the reverse, more money might be given for agricultural education than in the days of 1902?—Yes. What one has learned by talking to one's contemporaries in certain other counties shows that they grumble in the same way.

3635. But they have got to pay for elementary education and other matters as well, and I do not know whether you are aware of it, but in consequence of the fact that they have got to put a good deal of money, raised for secondary education, to the training of teachers, they are very much more cramped in regard to the amount of money they have to spend on ordinary education than they were some years ago?—Yes.

3636. I only want to point out to you that there is another side to it.—Certainly, I agree there is another side.

3637. (*Mr. Staveley-Hill.*) You spoke just now of there being not much active hostility to the work. I understand from the position of this farm it is about the centre of the County of Bedford, is it not?—No; hardly the centre.

3638. It is well in Bedfordshire?—Yes, well in Bedfordshire.

3639. Do you notice there is any more friendliness shown by the farmers of the contributing counties of Hertfordshire and Cambridgeshire than there is in Bedfordshire?—No.

3640. It is all the same?—Practically all the same; but of course as contributing counties we do nothing for them except at the Institute. We do not do any outside work for those contributing counties.

3641. If you had more money given to you in the form of a grant or in any other way, should you devote that money to the scientific side of the teaching?—I should try to devote a portion of it to the answering of practical questions, and questions that could only be answered by scientific research for the farmers.

3642. That would make the institution more popular amongst the farmers, would it?—I think it would, certainly; but I should certainly devote a good deal of the money, if we had more, to teaching pupils in the Institute. I think we might do very much more in that way than we do.

3643. I notice that you allude to sheep-shearing and horse-shoeing, and so on, and do you give any practical instruction in draining?—No; we have never done anything in that way.

3644. Why not, in a county like Bedfordshire and the surrounding counties? Do you not think it is necessary?—It is certainly necessary.

3645. I should have thought it was one of the most necessary things.—It is certainly necessary; but there is one thing in it, and that is this, that the majority of the tenants look upon draining as a landlord's job, and none of the ordinary labourers would do it.

3646. It is common knowledge throughout England, is it not, that a good many of these things are dying out, or rather the knowledge of them? It is very difficult to find practical men to do this work, is it not?—I think it is. I think that is quite our idea, but I must confess it is rather a new idea to me to take drainage.

3647. But you think it might be considered if you had more opportunities?—Yes, certainly.

3649. (*By Lord Moreton.*) Why do your people go to Kilmarnock, in Scotland, which is a long and expensive journey, rather than go to certain other institutions which I need not specify by name, but which we all know exist?—Because both my dairy teachers and myself think they get better training in Kilmarnock.

3650. When at Kilmarnock do they go in for the Diploma in Dairying?—Yes.

3651. Have they been fairly successful?—No, they have not been so successful as we might have hoped.

3652. Is it easier for a pupil to study dairying and go in for a diploma and pass satisfactorily if the examination is held at the place where the tuition has been given?—Yes, I think that would be so.

3653. There is rather an advantage, or there may be an advantage very possibly, in that?—Certainly, I believe that is so, but of course that examination is likewise held in England.

3654. I am perfectly aware of that, and that is what made me ask the question why they went to Scotland.—Just so.

3655. Now one or two questions about stock on the farm. What class of stock do you keep at present?—The ordinary mixed dairy herd, and a mixed breeding flock—the ordinary butcher's breeding flock, and some pure-bred pigs.

3656. Have you formed any idea of what it would cost in your county if they ventured to adopt this idea of breeding first-class stock on a 270-acre farm?—If one did it in a tentative fashion to begin with, and if one had another £500 or £600 of capital, one could start it at that. It would take time to work up.

3657. Do you think it would make the farm popular amongst the neighbouring stock dealers if they felt that you were underselling them with animals bred with county money? Would not it tend to cause some local jealousies?—It might cause a certain amount of local jealousy,

but it would cause a great deal more satisfaction amongst the majority than it would cause dissatisfaction among the minority.

3658. You spoke of pure-bred stock—that is stud animals?—Yes.

3659. Stallions and bulls and rams?—Yes.

3660. Are they unable to get them now?—They have to pay a pretty high figure for them if they can get them.

3661. Would you sell them?—Yes, at the ordinary market price of the day if we could produce them at a lower figure.

3662. (By Mr. Latham.) Do you think that, knowing the opposition there is in Bedfordshire and the surrounding counties to this higher education, you could formulate any scheme that would make it less opposed than it is now?—I do not quite understand your question.

3663. You propose that the allocation of the “whisky money” should be used in that way. I know Bedfordshire pretty well and I think there is a very strong feeling against this higher education, and do you think there is any scheme that could possibly be proposed that would make them go further than the scheme which you propose?—I do not think it would make them more against it than they are at the present time.

3664. Not if you take the money away from them and raise the rates?—If you raise the rates you do so for the secondary work, and the higher education committee, having the doing of the secondary work, would be the people to raise the rates. The agricultural committee would be clear of the rates altogether, and if they said anything to us we should say we do not get a farthing from the rates.

3665. The money raised from the rates now would be taken away, and I do not see how you would have any more money to go for higher education with. Would it not be better to prove that the Treasury should give more money to the Board of Agriculture, and leave the rest of the money where it is now. Do not you think that is a much better thing?—It would be a much better thing to get more money from the Treasury, but still I think it would be far better if the Board of Agriculture had practically the whole of this money that goes to agricultural education.

3666. In my experience a great many very large farmers feel up to the present time that there is no need whatever to get higher education both in Bedfordshire and other counties in England, and if you take the “whisky money” and the money used for secondary education away, and make their rates go up, that would be the surest way possible to make them dislike it more?—I should not take it all away, but only the same proportion of the “whisky money” that was spent before the Education Act came into force.

3667. Then what are you going to do with the counties that never gave anything at all to it?—I think if you went back before the Act of 1902 you would find the majority of the counties did give very largely.

3668. I beg your pardon, a very large number did not give.—I do not think so, though I have not got the figures.

3669. I am quite satisfied I never made myself so unpopular in my county as when I used to say that if they gave the money entirely to the rates we should lose it altogether.—But that was before 1902.

3670. Yes. There was a great desire in the Berkshire County Council, as in many other County Councils, to give money entirely to the rates.—If you take it down to 1902, a lot of these County Councils had learned sense before 1902, and had devoted a considerable proportion of that sum to agricultural education.

3671. And when 1902 came in they lost that sense, did they?—I do not say that at all.

3672. You spoke of the children of the farmers. What do you mean by the children of the farmers?—I meant the boys and girls and men and women. I did not like to say sons and daughters. It was to prevent repeating myself, that is all. I mentioned elsewhere in my proof that the average age is between 18 and 20 years.

3673. Then they would hardly be called children?—However, that is all I meant.

3674. You do not wish to make your place look as if it were simply a place for children?—No, but I mentioned the average age of 18 to 20 years. We do not take anybody under 16.

3675. Do you think it is an advantage to them to have these few examinations that you give, simply from inside?

—I think for a 15-weeks' course it is not worth the expense of going through an outside one.

3676. It would make the certificate of value if it were conducted outside, would it not?—I do not think, for a 15-weeks' course, the certificate ought to give any very great value.

3677. With regard to the short course, you do not seem to hand them any paper or anything which will be of advantage to them afterwards as a reference?—I give them a small certificate saying that they have been present.

3678. Simply a thing to hang on the wall, which would be no use whatever to them?—Yes.

3679. Do you think that is satisfactory?—If they are going for a five-weeks' course they are satisfied with it, and anybody who has only been for that time does not deserve to have anything more.

3680. You are aware very many of the dairy schools that went about the country only lasted 10 days?—Yes.

3681. And many of the competitors were asked to write an epitome of what they had gone through; and do not you think it was very useful as a matter of reference for them to have done that?—Certainly.

3682. Then if they had been five weeks it would be just as well to have something of the same sort, would it not?—I do not give them a *bona fide* examination, but I always hold a kind of half examination at the end of each five weeks conducted amongst my own staff.

3683. Do not you consider the fact of their having been there only five weeks, and having nothing to take away, they would very soon lose the education which they got?—They can take away something, but there is nothing to show in the way of a certificate. But they have got all the notes and all that sort of information.

3684. But not in any way registered, even by your signature?—Yes, there is my signature. There is a little thing given by me with my signature, showing that they have been there for the five weeks and have attended.

3685. I do not think you were very strong in your explanation of your experiments. What were they?—I call them demonstrations. I do not call them experiments, because they are not to find out anything. They are to show clearly the main points that have been found out at research centres.

3686. Why is it you do not have any summer course for men?—Because the men have plenty of work to do at home.

3687. That rather answers the question that you do teach summer work from a practical point of view?—No, we do not.

3688. With regard to your pupils in shoeing, from what class do you say they are taken?—They are all young blacksmiths, blacksmith apprentices, and blacksmith journeymen.

3689. Such as doormen, and so on?—Yes, that sort of thing.

3690. You say you should have a practical blacksmith as teacher?—Yes.

3691. Is he one of the registered smiths?—He is. He won the championship at the Bath and West Show.

3692. With regard to the lectures the veterinary surgeon gives, does he not lecture by means of diagrams?—No; it is usually by absolute specimens. He brings the horses' feet with him, and the bones and mounted specimens, showing the different cartilages and varieties of bones, and diseased bones and sections of hoofs.

3693. Those are lectures that would be recognised at the Farriers' Company, are they?—Yes; I have had 20 men pass the examination in the last two years, ready to be registered.

3694. What does the evening school of stock management mean?—I went to this school, where there were about 10 or a dozen boys, ploughboys and fellows working amongst cattle, from about 16 to 18 years of age, and I talked to them on points in connection with stock management for about half an hour. Then they had note books, and they wrote down what they heard and what I told them. We then corrected that for about another quarter of an hour, had another short talk with them, and then they repeated it, and wrote some more down, and I corrected what they had written.

3695. You, I believe, got a great deal of your knowledge as to stock management from practical people?—Yes, certainly; I got it all from such people.

3696. As a rule, the management of stock would be very little taught in colleges, and would be of very little value if

Mr.
E. Druce.
14 May, 1907.

Mr.
E. Druce.
14 May, 1907.

it were ?—It is not very largely taught, and some of it is not of very great use.

3697. I do not quite understand what you mean by the pressure of work which has been difficult to carry out, but which now appears to be satisfactory as giving instruction in manual processes ?—In giving instruction in that branch of work we find it very difficult to carry it out satisfactorily.

3698. What is meant by manual processes ?—Ploughing and hedging and ditching and dairying.

3699. More in the nature of labourers' work ?—Yes.

3700. That is what it means ?—Yes.

3701. You have never attempted to teach the young agriculturist manual labour ?—No, except that all the students who are with me do some hedge trimming, and, of course, they do ploughing, and they do a certain amount of thatching. The ones that attend the full course for 15 weeks I have put on the farm two mornings a week doing jobs on the farm, but not to try to make skilled labourers of them.

3702. With regard to that question, have you been teaching any hedging and ditching and thatching and that sort of thing ?—Not hedging and ditching, because I have not been able to get a class to do it. But my committee gave me a grant to do it if I could get the men.

3703. There was quite as much wish for that as for more scientific work in your county, was there not ?—Yes, but we had not been able to do it to satisfaction.

3704. Evidence was given about the great feeling there is against teaching improved agriculture in Bedfordshire, and do you agree with that ?—I think Mr. Inskip was rather too pessimistic. He feels the brunt of it, but when one goes amongst farmers at markets and public places one does not feel it so much as he does.

3705. Do you lecture in the large market towns round the county ?—In most of them, not all.

3706. How have you been met ?—Very well indeed.

3707. Large audiences ?—As good audiences as they ever have, and there are good discussions afterwards, and some rather flattering remarks occasionally are made.

3708. Then you do not agree there has been a good deal of ridicule ?—Certainly not, so far as I am myself concerned.

3709. (*By Dr. Somerville.*) Do I understand you agreed with Mr. Latham when he said that the principles of stock feeding were seldom taught in the colleges, and when they were taught they were not well done ?—I put it not quite in those words. I said they were not fully taught, I think.

3710. Why should the management of stock and the principles of breeding not be properly taught in agricultural colleges ?—I do not know why they should not be taught so, but my experience, and one's own feeling as to what one learns, shows the reverse. One learns far more before coming to an agricultural college and after than one ever learns from any lectures.

3711. I suppose you know that all the higher agricultural colleges in England have got farms attached to them ?—Yes, I think they have now.

3712. At those farms numbers of stock are kept ?—Yes, but of course some of them have only got that recently.

3713. Which one has only got it recently ?—I think Aberystwyth.

3714. Are you aware that at Aberystwyth they have taken a very large number of prizes for stock that they have shown in the past year ? They published a list which showed that their successes in the show ring have been quite phenomenal, and they have in some cases practically swept the decks ?—I have not heard that.

3715. At Bangor they exhibit regularly, and at the Agricultural Society's Shows, with great success ?—Yes.

3716. Are you aware their stock have figured in the publications of the Department of Agriculture of the United States as examples of the best specimens of animals found on this side of the Atlantic ?—No, I did not know that.

3717. With regard to your system of supplying science lectures, do you not find you must constantly change the lecturer, when you practically dismiss the man at the end of each winter and make a fresh engagement ?—We have been very successful up to the present in regard to that. We have only had to change once, because we have been able up to the present to lend the man to one of the grammar

schools in the county during the summer—we practically lend him to them, but they pay him. We hire him out and he comes back again, but of course that would be a difficulty, and if we had more staff one would have preferred to have a man permanently.

3718. Where does the instructor in ploughing, for example, come from ?—He is a man in the county.

3719. Is he a man who has a situation as a ploughman ?—Yes.

3720. You have no difficulty in getting farmers to allow their best ploughman to get away for some days or weeks to give instruction, have you ?—I have not up to the present.

3721. Because if he goes round and gives a day to each pupil, I suppose that means a good many days away from his master's work ?—Yes ; but it might not be a day to each pupil, because you might have two or three pupils on the same farm, and he would do all those in one day, and I have known cases where there have been two farms quite close to one another, and I have arranged for him to go to both farms on the same day. But the man last year was away something like a week or 10 days from his master in all, and the master did not object at all.

3722. A substitute must be found somewhere. I do not suppose the master was satisfied to see his team standing in the stables doing nothing ?—No ; but that is a question for the master himself.

3723. Are the candidates for the certificates of the Worshipful Company of Farriers all apprentice blacksmiths ?—No ; some of them are master men.

3724. But they would not grant a certificate to a young farmer who had passed his course ?—I think they would grant a certificate to anybody who passed the examination.

3725. They are not a close corporation, then ?—No ; only the candidate would have to pay certain fees before he could have his registration.

3726. Do all the students in your school reside there, or do any come in the morning and go away in the evenings ?—A very few of them. Occasionally one comes in that way, but you might say that practically the whole of them are resident.

3727. I suppose you would not take in a man as a resident student if his father lived a couple of miles away ?—Yes, I should.

3728. Would you rather have him inside, even though his home was half an hour's journey off ?—Certainly, I should prefer it.

3729. Even though in the one case public money is being spent upon his maintenance, and in the other case he would obtain it free of the institution ?—Certainly ; because he would not be able to get his full work if he lived some distance away. My men all stay close at hand. If a man was living two or three miles away, one could not expect him to come before nine o'clock.

3730. (*By Mr. Medd.*) What is the average age of the students coming to you ?—About 17, or from 17 to 20.

3731. Do you find that these students as a rule are quite sufficiently qualified to profit by your instructions ?—Yes.

3732. They are not defective, for instance, in arithmetic or spelling, are they ?—Arithmetic is their weakest point.

3733. Where have they generally been educated ?—They have mostly been at secondary schools.

3734. Has any interval elapsed as a rule between their leaving there and coming to you ?—I should say the majority of them come straight from the secondary schools. But a certain number have an interval of about 12 months before coming to me.

3735. Except in regard to arithmetic, they are fairly well trained ?—Yes, but in arithmetic they are decidedly weak.

3736. You are very anxious, are you not, to have your short courses extended ?—Certainly.

3737. And made into one course of 20 weeks or 25 weeks ?—Yes.

3738. What accommodation have you for resident pupils now ?—We have bedroom or dormitory accommodation for 22, but we have no students' common room. We have only one lecture room, and we have got no laboratory at all.

3739. Then you would require a laboratory ; that is essential ?—Yes.

Mr.
E. Druce,
14 May, 1907.

3740. Then the sleeping accommodation for 22 is enough, I suppose?—Yes, that will be ample, I think.

• 3741. What else do you consider essential?—I should say a students' common room is essential. That would be absolutely essential. Then, of course, if we had that number, and especially if we had that number of female students, our dairy would not suit us, and some of the outbuildings for poultry and that sort of thing would not be sufficient.

3742. What is the general condition of your outbuildings? Is that satisfactory?—They are in a very good state of repair. But there are not enough of them.

3743. Do you think it would be practicable eventually to convert your institution into one of the same type as Holmes Chapel when you were at Holmes Chapel: that is to say, a permanent intermediate school?—I think it would be better to remain as it is.

3744. With the exception that you would increase the duration of the courses?—Yes.

3745. But you would not advocate its conversion into a permanent intermediate school?—No, certainly not.

3746. What are the specific directions in which you think its usefulness would be increased, both as an institution itself and in regard to Bedfordshire—taking the institution itself first?—Taking the institution itself first, I think if we could give a full winter course for two winters to a large number of students it would benefit them and give them a larger amount of information which they could put into practice at home, and in that way they would not only improve their own position but they would improve the agriculture in the county too, generally speaking.

3747. They would be pioneers in advanced agriculture wherever they settled?—Yes.

3748. There are no other directions in which you could help Bedfordshire as an institution, are there?—Yes, I think we could do so by doing more in the way of outside lecture work. I rather differ from my chairman on that point. I think there is still quite a lot of room for outside lecture work, provided it is well done.

3749. Now in regard to the training of teachers, you have not done anything yet at Ridgmont?—No, nothing at all.

3750. I suppose it is quite possible for you to organise classes for them?—Yes, it would be possible.

3751. There is no reason why you should not do it, I mean, is there?—No, except that it is a question of finance.

3752. When at Holmes Chapel you had very satisfactory Saturday classes?—Yes.

3753. They were quite a success, were they?—They were quite a success.

3754. There would be no difficulty in organising similar classes at Ridgmont, would there, or has it ever been brought before your local authorities, do you know?—No, but they had their Saturday Teachers' classes in the way of nature-study classes two or three years ago, which met at Bedford. I think Mr. Biffen was the teacher. That has been dropped.

3755. Just as you may say the classes at Holmes Chapel were superior to what one might get at Manchester, so the classes for teachers at an institution like Ridgmont would be better than an urban centre like Bedford?—Certainly.

3756. Now I hope you will suggest it to them.—We want a start. That is the trouble.

3757. (By Mr. Davies.) You are in very close touch with the Agricultural Department at Cambridge, are not you?—Not very close, but we are in close touch.

3758. You always go to them for assistance?—Certainly, if we want any assistance we go to Cambridge before we go anywhere else.

3759. Does your county make any grant?—Yes, it makes a grant of £50 a year.

3760. What is given for that?—They take us over their farm and they give us information we ask for, and send us all their reports, and I believe we could send students at a reduced fee.

3761. Do you ever send students?—No, because, although we could do it, the man could not afford to pay even the reduced fees, and my committee would not give any grant to pay them, or even to help to pay the fees.

3762. That is one of the things that you would like to see done, to prepare young, promising students to take a further course of study at Cambridge, if they won a

scholarship?—Certainly, if we had to do with a worker one would advise him to go to Cambridge and take the course there, if one could assist him.

3763. You regard yourself as more or less a missionary college for Cambridge in your particular scheme, do not you?—Yes, we always look to Cambridge as our head and centre.

3764. So that if you had a grant of money, and the Government were very generous, and you utilised that money for laboratories, would you apply it to chemical work?—Yes, I should like a small laboratory.

3765. Simply for your short courses?—Yes.

3766. You would not try anything beyond the short courses?—No.

3767. Not anything like a three-years' course?—No.

3768. Then with regard to the short courses in villages, you had a very successful class in which you gave instruction in the village?—Yes, it was a fairly successful class for this winter.

3769. Do you think that kind of classes are preferable to public lectures—do they do more good?—I think the majority of them do more good. I think a few public lecturers to start with might create an interest, and then there should be a class like that. A class does a considerable amount of good.

3770. Does it not prepare men to come on to your college if they wish?—Certainly; a certain number of them would come, and then a certain number of the labouring population would become better-class labourers who get no chance of any other thing. They go to a popular lecture, and it is rather beyond them, perhaps; but yet there is an evening school, in any particular subject, and the teacher can bring himself down to their level, and put things before them in more or less homely language, which could not be done otherwise.

3771. Did you find they appreciated the instruction you gave them?—Yes, certainly in that case they did, decidedly.

3772. None of them had been to a secondary school, had they?—No; none of them had anything but the ordinary elementary education.

3773. After the course of lectures you gave them at this village, would they be able to take your short course?—No, I do not think they would. The majority of them that went to the class were boys earning 6s. to 7s. a week.

3774. Then with regard to the chemistry, you have not an agricultural chemist?—No.

3775. Who does the agricultural chemistry?—The county analyst.

3776. Where does he reside?—He resides in London.

3777. There is no chance of your being able to appoint an agricultural chemist who would be also responsible to the county?—No, I do not think so. I think there would be a good deal of opposition to that.

3778. By the County Council?—Yes. I think there would be opposition to it. I should not like to say definitely, but I fancy there would be a good deal of opposition.

3779. But if you had laboratories there it might be all right?—I should have a chemist there, or a science teacher.

3780. You said, I think, that students ought to know something about practical agriculture before coming to the college. Do you make it a rule to tell a student that he must have put in so many months on a farm as a practical farmer?—No, we do not make that stipulation.

3781. But you think it would be advisable to do so, do you?—No; not to make it a stipulation, but to suggest to a possible student that he should put some time in on a farm. But I think as things are at present it would be rather too drastic to say that he must do so before he comes to the Institute.

3782. That is your reason; it is not because you do not think he ought to do so?—No; it would be rather too drastic, and choke too many men off who would become really useful students.

3783. (By Lord Barnard.) About draining, I suppose you would scarcely deny that draining is one of the most important and possibly at one time one of the most contentious matters connected with the principles of agriculture?—Certainly that is so.

3784. The reason you gave that it is not necessary that any instruction should be given in it in such an institution as yours is because it is a "landlord's job"?—I did not mean it as instruction in the institution, because the

Mr.
E. Druce.
14 May, 1907.

pupils that are in the institution are taught the principles of draining fully. The question I intended to answer was that we do not give any practical instruction in drainage of the same nature as our sheep-shearing instruction or ploughing.

3785. But you have given us a good deal of information as to farriery, which is given so as to enable men to learn to earn their living as farriers, and I should have thought that to teach them to earn their living as drainers would be quite as important?—It is important, but a man who does drainage would be employed by a big estate.

3786. You do not think that big estates are a sufficiently important integral part of British institutions to be worth expending money on in that way, do you?—I think that has escaped rather my own observation, and I think it has escaped the Committee's observation.

3787. Is it your view that the owners of big estates should themselves provide instruction for their drainers, or how is the drainer to be instructed?—I think now, having had my attention called to the question, the drainer should be instructed by the County Council the same as other men. Only it is a point that had not occurred to me before it was mentioned in this room. That was all.

3788. I did not want it to go forth that you were under the impression that the landlord was not a person who need be taken into consideration.—Certainly not.

3789. (*By the Chairman.*) Then with regard to the "whisky money," my interpretation of the theory that you have developed before the Committee is this, that there is the county aid to which Lord Belper alluded and that an adequate amount of "whisky money" is spent on agricultural education?—Yes.

3790. That is county aid?—Yes.

3791. That county therefore does its duty, and that county you would leave alone—you would not interfere obviously with a county that was doing its duty in agricultural education?—No, certainly not.

3792. But you would say to a county which was doing nothing for agricultural education that you would give the Board of Agriculture (I am speaking of your theory now) power to intercept the "whisky money" in county B, so as to level up county B with county A?—No, it is not quite like that. That was not quite my theory. My theory was that to make things level, even if the county was doing its duty and giving the money, that money should be taken away from them.

3793. Then your point is that the Board of Agriculture should have a certain amount of control over the "whisky money," so as to ensure that the "whisky money" spent throughout England in all the counties should be proportional to the wants of agricultural education?—Certainly.

3794. That is the idea?—That is the idea, to put it shortly.

3795. In other words, you want the Board of Agriculture to have control over the spending powers of the County Councils with regard to agricultural education?—Certainly.

3796. And to co-ordinate it over the whole county?—Certainly.

3797. That is what I understood. You do not want to stereotype, of course, the circumstances of 1902, in which some counties did less and some more?—No.

3798. But your object would be to ensure in future the spending of such an amount of the "whisky money" in all the counties more in that way?—Yes, certainly. The reason why I took 1902 was because that was when the change came.

3799. I only wanted to make clear what your opinion was.—That is it.

3800. Now you have stated that you consider that more was being done for higher agricultural education than for lower agricultural education?—Certainly.

3801. That is, the grants of the Board of Agriculture were given more to higher education than to lower education, and I might ask what, according to your meaning, should be done for what you call lower agricultural education, by which, I suppose, you mean agricultural education to be given to those who at the age of 16 or 17 have to stop and cannot therefore go to colleges and so on. Would you give to the Committee your idea as to what kind of education or what kind of institutions should be provided for those who would leave the elementary school and at the same time are unable to go on to college, but are able, or would be able, to attend institutions in their neighbourhood of the character of a higher elementary school?—I think an institution of a similar nature to what we have at Ridgmont is the class of institution that should be provided, where they could come for the winter-time, when the work at home is not so heavy. They could come there and get a certain amount of scientific information, a good deal of practical agriculture, and a good deal of the theoretical side of agriculture with its bearing on practice. I think during the winter months that could be done at a low cost, and they could then go back to their homes in the spring when they are wanted and work during the summer-time.

3802. You would multiply winter schools for that class of pupils, and have summer classes supplementary?—You might have an odd summer course for some students.

3803. Would you multiply the winter courses?—Certainly I would multiply the winter courses.

3804. You would have institutions where agriculture was taught practically mainly, with a certain number of scientific lectures in some shape?—Yes.

3805. On purely elementary science?—Yes.

3806. That would not be agricultural science?—No.

3807. But agriculture would be taught at these institutions?—Yes.

3808. These institutions you would multiply?—Yes.

3809. And as to the farmers' sons who cannot attend secondary schools where general education is given to prepare them for Universities, these are the institutions you contemplate would be intended for them?—They would be.

3810. You think that the giving of such instruction, practically supplemented by scientific elementary teaching, would be of very great value to the farming community?—I certainly think so.

EIGHTH DAY.

Wednesday, 15th May, 1907.

PRESENT

The Right Hon. Lord REAY, G.C.S.I., G.C.I.E. (*Chairman*).

The Lord BARNARD.

The Lord BELFER.

Lord MORETON.

Mr. F. D. ACLAND, M.P.

Mr. DAVID DAVIES, M.P.

Mr. NORMAN LAMONT, M.P.

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Professor T. H. MIDDLETON, M.A., M.Sc.

Mr. H. S. STAVELEY-HILL, M.P.

Mr. A. E. BROOKE-HUNT (*Secretary*).

Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. W. M. CHILDS, M.A., called and examined.

3811. (*By the Chairman.*) You are the Principal of the University College, Reading?—Yes.

3812a 3812b 3812c

3812. Will you give the Committee some account of the history and development of the Institution?—The University College at Reading was founded in 1892. It became a University College in 1902 after inspection by the Treasury Commissioners. It has grown so rapidly that its original buildings became inadequate, and in the last three years the whole institution has been removed to a new site, exceeding five acres, in the middle of Reading, and new buildings have been erected. The Council of the University College contains representatives of the Reading Town Council and the Reading Education Committee, of the University of Oxford, and of the County Councils of Berkshire, Buckinghamshire, Dorset and Oxon. I can give any further particulars about the College generally the Committee require. The College is organised in seven Departments, the usual Literary and Scientific Departments, Agriculture, Horticulture, and then we have Departments for the teaching of Fine Art, Music, and a number of miscellaneous subjects in evening classes. I ought, perhaps, to say that we have a somewhat extensive provision for the residence of students who are not resident in the town or in the immediate neighbourhood. Of such students we have about 150 altogether. We have, for example, two hostels for the reception of women students, which between them accommodate about 80 women. One of those is a new building and the other is an adapted building. Then we have lately received a great benefaction from Lady Wantage, who is a Vice-President of the College, intended for the benefit of men students. I have here one or two photographs of the design for this building which the Committee may like to see. (*Handing same.*) It is an unusually large and appropriate building for the reception of men students. It will accommodate about eighty students of all departments, including the agricultural and horticultural men students whose homes are at a distance from Reading. I ought perhaps to have mentioned at the beginning that among the papers which I think have been circulated to the Committee, on the first page there is a map of Reading which shows the position of the College and of the site of this new hall of residence, and it also shows that the men's hall of residence lies between the College where the scientific teaching is given and the farm, which is two-and-a-half miles away from the College, where practical and experimental work is done. At the present moment this building, which is to be called Wantage Hall, is not completed, and the men students reside in lodgings. The total charge for a man student, and also for a woman student, for a session of thirty weeks for board, lodging and tuition is about £50 to £60. Some of the students stay forty weeks, and it would go up at the rate of a guinea a week for that period. That was all I proposed to say with regard to the College generally. I would now ask leave to refer a little to the agricultural side more particularly. The Department of Agriculture was formed one year after the foundation of the College in 1893, and it was based on grants which were received from the County Councils around, and especially from the Board of Agriculture. The grant that was first paid to us from the Board

amounted to £150. That was in 1893. In 1894 the University of Oxford, with which the College has always for certain purposes been associated, passed decrees of Convocation which established a Joint Committee representing the University and the College. The Joint Committee, to be more exact, contains representatives of the Oxford University Extension Delegation, and of the College Council. In 1896, two years after that decree was passed, two representatives were added to the Joint Committee from the Royal Agricultural Society, and in 1904 two representatives of the Royal Horticultural Society were added. The Joint Committee is the body which grants the more important of the diplomas in Agriculture, Horticulture and Dairying, which are sought by the students of the College. Then I think the next important step was in 1895, when the British Dairy Farmers' Association moved their Institute, I have understood under pressure from the Board of Agriculture, from Aylesbury to Reading, in order that it might be associated with a scientific institution, and a Joint Committee was then appointed which represents both the Association of the British Dairy Farmers' and the Council of the College. I can give the relationship between the Dairy and the College if you would like me to do so?

3813. Certainly.—The Institution was built in 1896, and the land on which it stands is the freehold property of the College; it cost the College upwards of £6,000. One of the schedules which I have circulated will give that information. It was agreed that the College and the Association should each contribute annually half the deficit, if any, that is incurred in the maintenance of the Dairy Institute. The Institute is let to the Association by the College at an annual rental of £120, and upon the other hand the Institute pays the College £100 a year in order to have such scientific instruction from the College staff proper as the dairy students may require. I might add that from our point of view we do not regard that as a hard and fast bargain. We try to give, and the Director of the Agricultural Department will confirm what I say, as much scientific instruction as we can, and to induce as many of the dairy students as we can to receive scientific instruction from the College staff. The next step in this agricultural development was in 1902 when we organised, in association with the Agricultural Department, the teaching of Horticulture in a Department of Horticulture. Previously a certain amount of horticultural work had been done at Reading in connection with the Lady Warwick Hostel, which at one time was established at Reading, but which left Reading some years ago. In 1902 we at the College resolved to organise this Horticultural teaching for which we found a demand on our own account. Our horticultural ground adjoins the College site; it is marked on the first of those plans, adjoining the buildings. It is practically part of our grounds; it extends over 3 acres, and we hold it on lease from Mr. Alfred Palmer. It is an admirable piece of ground because it was formerly in the occupation of Messrs. Sutton at Reading, and we entered upon it therefore with many advantages due to their previous occupation, and to the kindness of that firm. The Horticultural Diplomas, of which I will speak later,

(*Mr. W. M. Childs.*)

15 May, 1907.

3812d

3812e

3813b

are sanctioned by the Oxford and Reading Joint Committee as I think I mentioned, and this garden, or practical teaching ground, was opened in 1904 by Lord Onslow when he was the President of the Board of Agriculture. Lastly in 1903 the Council bought a farm of 145 acres at Shinfield. I am afraid I have not been able to show that on the map, but I have shown the road which leads to the farm, and, as I have said, it is about two miles or rather more from the College itself. I would, therefore, point out that the provision at Reading in respect of agricultural and horticultural instruction and research is, as we think, rather unusually complete, and may be thus summarised; that you have two Departments, working in intimate contact, of Agriculture and Horticulture, each with a specialised staff (not as large as we think it ought to be), each in contact with and utilising to the maximum extent the scientific teaching that is naturally to be found in a University College, and each, also, deriving a certain amount of advantage from the existing administrative organisation of the College. In the second place, there is the farm for practical and experimental teaching. In the third place, we have a fruit station of 11 acres on the College farm, planted for the purpose of teaching fruit cultivation. In the fourth place, we have a poultry farm of 40 acres at Theale, five miles from Reading, easily accessible by rail, a farm which is not our property, but which we have the control over for practical purposes. There are buildings on that farm which we have erected partly at our own expense for teaching and experimental purposes. Lastly, we have the British Dairy Institute which is a most valuable adjunct or ally of our work, and works in the closest association with the Agricultural Department.

3813c

3814. You have a Council governing the College?—Yes.

3815. How are the members of that Council elected?—Some of them are elected by the Court of Governors of the College; some of them are co-opted by the Council itself, and some are elected by Local Authorities in the neighbourhood, such as the Corporation of Reading, and the County Councils of the neighbouring Counties, Berkshire, Oxford and Bucks., which make financial contributions to the College. I think that is the complete account of the composition of the Council.

3816. The Court of Governors is elected by the Governors?—The Court of Governors are the Governors.

3817. They are a numerous body?—Yes, they are a numerous body.

3818. Are the Governors those who have contributed to the funds of the Institution?—Yes.

3819. Benefactors we may say?—They are benefactors.

3820. Then there is an Academic Board?—Yes, an Academic Board is appointed by the Council and is responsible with the Principal of the College almost exclusively for the internal organisation and courses of study, and all matters that have to do with discipline and questions of that kind. I forgot to mention just now that the University of Oxford also nominates a Member of the Council.

3821. Does the Council meet frequently?—Once a month during session.

3822. And the Academic Board?—Once a month also.

3823. Who deals with the finance of the Institution?—The Council exclusively.

3824. There is an Oxford and Reading Joint Committee besides?—Yes.

3825. What are the functions of that Committee?—The functions of the Joint Committee are exclusively to provide for the examination (and the award of the diplomas) of students who enter the College for the diplomas in Agriculture, Horticulture and Dairying.

3826. The Oxford and Reading Joint Committee deals with the educational part?—It deals with that part of the educational work of the College—simply with the agricultural and horticultural examinations.

3827. As you have mentioned there is a Joint Committee for the management of the British Dairy Institute?—Yes.

3828. That is representative of the Dairy Farmers' Association and of the College?—Yes.

3829. That deals exclusively with dairying?—That deals with the management of the Dairy Institute; it is their executive body.

3830. Then in addition there are representative

trustees?—Those have no concern with the government of the College.

3831. They only deal with the finance?—I think what you are referring to, my lord, are trustees appointed by the Council—at least I imagine so—you will see it on page 43 of the calendar; they have nothing to do with the College; they are nominated by the Council to deal with charities outside which have nothing to do with us.

3832. They are merely an outside body?—They are merely nominees.

3833. Now, with regard to the courses of study, perhaps you will give us some information on that point?—I have circulated a paper marked C. From that paper it will be gathered that the courses of study as distinct from local lectures, are of two kinds: there are the diploma courses upon which the Oxford and Reading Joint Committee examines and awards the diploma. Those courses extend in every case over two years, and where the student wishes to get the diploma with distinction, then over a third year. As distinct from those there are certificate courses, in which the certificate is granted by the Academic Board of the College, and in regard to those certificate courses the duration is one year, or in the case of the agricultural certificate, a six months winter course. I think that is all I have to say on that apart from what is on the sheet.

3834. A six months' course and a one year course?—In regard to the certificate, yes. The certificate in horticulture, I think, lasts one year; the certificate in agriculture lasts over the six months in winter—the two winter terms.

3835. Does a University give any degree to your students?—We have, as a matter of fact, in the College now one student who is seeking the B.Sc. degree in Agriculture of the University of London.

3836. There is no Bachelor of Science degree in Agriculture of the University of Oxford?—No.

3837. Then there is the diploma in dairying at the end of the two years' course?—Yes.

3838. That is given in connection with the Dairy Institute?—Yes.

3839. And a certificate in dairying at the end of one year's course?—Yes.

3840. Then the certificate in Agriculture?—That is at the end of six months in the same way.

3841. Then you have three months' practical training on a poultry farm?—Yes.

3842. That poultry farm is situated five miles out of Reading?—Yes, at Theale, on the Great Western.

3843. That was started by Mr. Edward Brown?—Yes, I think he initiated it.

3844. Is there any chance of that farm being taken over by the College?—Do you mean being bought by the College?

3845. Yes.—I do not think the Council are likely to buy it, because they have no inducement to buy it. They obtain all the use of it under the present conditions which they desire.

3846. Do you pay any rent for it?—I would rather the Registrar were asked as to the finance of the poultry farm—it is somewhat intricate.

3847. Very well. Are the diplomas and the certificates chiefly given to sons of farmers?—I have some information about that which I was preparing to go on with under the heading "type of student attending the Institution."

3848. Then perhaps you will give us that later. Have you any further information with regard to the courses of study?—I have nothing further to say with regard to that.

3849. Then the number of students who have come for instruction?—I have circulated two sheets, D and E. D gives the number of students actually in the College in the present session apart from the students who are there for quite short periods. I have not included those. The students on this list, amounting to 60 altogether are there for one, two or three years, or as a minimum about nine of them would be there for six months, the agricultural certificate course. That is on Schedule D. That is followed by Schedule E, which gives the number of students, the gross totals, who have pursued courses in these various subjects that are there named in the last ten years. In regard to your

Mr. W. M.
Childs.
15 May, 1907

3849a question respecting the type of student attending the College I would like to say in the first instance that the type is so varied that it is somewhat difficult to distinguish one element as against another. These students come to us at Reading from all over the world. Of course the majority are from this country, but we have a certain number from the Colonies, and we have also a contingent from foreign countries. I should say that in our ten years' existence there is hardly one European country that has not sent us a student or students, but no doubt predominantly most of these students, or rather the parents of most of these students, are connected with land in this country. I see for instance that in 1904-5, out of 19 students taking diploma courses, nine of them were farmers' sons, and two were the sons of land-owners as distinct from tenant farmers. Then I have certain particulars which I was asked to give as to the after history of the students. These materials I should like to say are not as complete as we should like to make them, or as we could make them, but the notice was not long enough to enable us to treat the point quite fully. Most of these students become either teachers or farmers or gardeners. I would like to submit to you the results of 16 returns under this head in Agriculture that have come in within the last few days. Nine of these returns relate to diploma students and nine to the agricultural certificate students, the winter course. They are taken at random. With regard to the nine diploma students, one is assistant lecturer in agriculture to the Hereford County Council; another has just taken a farm; then there are two brothers who will be referred to by Mr. Martin Sutton later, one of whom is farming 800 acres on his own account, and the other assisting in the management of a very large farm in Hampshire; another is assisting in the management of his father's farm; another has for three years been farming on his own account; another is the Science Master in a grammar school—he has been diverted from agriculture—another is Agricultural Instructor in a grammar school, and helping to teach agriculture in the villages under the County Council, and another had charge of Sir Walter Palmer's two farms at Ascot, and is now Agricultural Lecturer under the Bucks County Council. The last, after being Lecturer in Agriculture for the Dorset County Council, has lately been appointed an Agricultural Lecturer under the Egyptian Government. Those are returns which relate to nine diploma students which have been chosen quite at random. Then I take returns relating to seven students who went through the six months' course for farmers' sons, and who obtained certificates. Of these, one is in an estate office on Lord Carnarvon's estates; another is solely responsible for his father's farm of 300 acres; another is the Staff Lecturer on Dairying and Poultry-keeping to the Hampshire County Council; another is assisting a farmer in the management of a farm; another is working on his father's farm of 1,400 acres, and the last, who is a woman, is giving assistance in a dairy farm and occasionally lecturing on agricultural subjects. All those particulars I hope may be taken as a fair sample of what is the after career of an agricultural student. Then I have some other particulars with regard to horticulture, particulars relating to 26 students, whom I can group in various categories. These students have all been through the College since 1902. Of market gardeners and nurserymen there are five; managers of market gardens, two; assistant manager on a fruit farm in South Africa, one; one engaged in his parent's business as a nurseryman at Shrewsbury; two Germans who have gone back to Germany to take part in a great seed business which belongs to their parents respectively; another assistant at a seed testing station at Grange-over-Sands; another who is hybridist to a leading firm at Surbiton; another who is manager of his own farm in Norfolk; another who is managing a dairy farm in Hampshire; another who is manager of his own farm in Hertfordshire; while four are giving assistance in the teaching and management of the College fruit station and of the College gardens, and six (which completes the 26) are gardening in private establishments. Lastly, 3849c I have particulars with regard to what happens to those who go through the courses in poultry keeping. I think the Committee have before them the prospectus on poultry keeping, and if you turn to pages 20 to 26 of that prospectus you will see the after careers of a very large number of students who have been through those poultry courses. Broadly speaking, I find on going through that list, that in the last 10 years, upwards of 60 students have obtained posts as lecturers or instructors, chiefly under County Councils, and it also appears, and the fact deserves note, that our students who have been

through the courses at College poultry farm at Theale, have a practical monopoly of the County Council posts connected with that subject throughout Ireland. I understand that in every County in Ireland, except two, the teacher of this branch of agriculture, of poultry keeping, is a person who has been trained at the poultry farm at Theale. I think that completes my evidence under that heading.

3850. As regards the staff of the Institution, what have you to tell us?—That comes in with what I was proposing to say a little later. The point I had down next was the sphere of influence of the College for agricultural purposes. Shall I deal with that now?

3851. Very well.—As I have said, the students come to the College from all over the country, and from other countries; but on the other hand, Reading lies in the centre of a very important agricultural district, a fact which has a real bearing upon our work. I might define this district roughly in reference to those counties or county authorities which either make financial grants to the College or maintain official connection with it in some form or other. Those counties are Berkshire, Buckinghamshire, Oxfordshire, Hants and Dorset. In some form or other the College has official relations with all those county authorities, and I may point out that that area contains over three million acres, mostly agricultural land, and a population of over 8,500 farmers. I might, perhaps, distinguish between those counties. Berkshire, Buckinghamshire and Oxfordshire make us a direct financial contribution. Buckinghamshire and Dorset appoint their own lecturers in agriculture on this understanding, that the College Authorities recommend to them whom they should appoint, and we do what we can to keep in touch with the agricultural lecturers so appointed. That applies to Buckinghamshire and Dorset. Again, Hants and Berkshire accord representation to the College on their Education Committees. Hampshire, again, although it does not give us a grant, invites the College to inspect the Basing Farm School. In addition it has founded scholarships that are tenable at the College and have been in operation now for a number of years. I should like, informally, to acquaint the Committee with the reality of this connection even with a County which does not give us a grant. For example, yesterday afternoon the Manager of the Basing Farm School came to Reading for the following purpose: the Board of Agriculture has given to the Hampshire County Council a grant of £100 a year in aid of the Basing Farm School, and the Manager of the Farm, came to see Mr. Percival, who is our Agricultural Director, in order to obtain from him advice as to how best to expend that £100 or part of it in a scheme of agricultural experiments. I point out that Hampshire does not make the College a grant. Perhaps we think it ought to do, but that is the kind of way in which an outlying County is in the habit of consulting the agricultural staff of the College. Of course, where a County Council gives a financial grant, the Council of the College offers certain advantages, for instance, in the reduction of fees. If a Berkshire student, for example, wishes to take the Agriculture Diploma Course, he gets a reduction of 25 per cent. on the fee. Then again, as Mr. Percival will explain, we have a system by which the farmers or gardeners of the County can send to the College for information on any point which they think we can advise them about, or send specimens of manures or milk for analysis. Mr. Percival will deal with that. Then we also give occasional lectures at village or county town centres. We feel in fact that the future of agricultural instruction at the College at Reading depends not a little upon the support that is to be obtained from the County Councils. We think that that is capable of a good deal of development, and in connection with that I have ventured to transcribe the paper marked F, which is an extract from Mr. Michael Sadler's report to the Hampshire County Council on their Secondary and Higher Education. It is not necessary that I should read it. The point of it is to call the attention of the Hampshire County Council to the fact that seven miles from their border they have an agricultural institution that is capable of giving them service if it is properly supported.

3852. I see that Mr. Sadler is of opinion that the scholarships which are now given to some of the students from Basing Farm School should not simply be given for the winter course, but that they should be given for the full diploma course?—Yes; we feel that very strongly, that where there is a good student who has been through the course at the Farm School

Mr. W. M.
 Childs.
 15 May, 1907.

3852a it is very desirable that he should be given the chance of taking the longer course at Reading. I think one or two of them have done that, but the number has not been so large as we think it should be. My last point was to deal with the policy of the College in respect of agricultural and horticultural education, and the financial considerations connected therewith, which brings in that question of the staff to which reference was made just now. I should like to say in the first place that the Council of the College have always recognised their special responsibility, and their special opportunity in this agricultural direction. They have always felt the force of the general argument that I have tried to state that Reading is in the heart of a great agricultural region. The proof of that recognition on their part I think is found on Table G, which shows that having regard to capital expenditure alone the Council have devoted to agricultural and horticultural work a sum in the last 12 years of very nearly £20,000. That of course is quite apart from what one would not bring under that head, the provision of scientific laboratories and general college buildings which are absolutely essential to the carrying on of agricultural teaching in such a place. In the second place I think I ought to say that the Council could not carry on this work at all on the basis of fees and of the existing grant. The Registrar who is to deal with any financial point required afterwards will submit a table which will show the actual deficits on annual working that have had to be faced from year to year by the Council. Agricultural education in Reading simply could not have been carried on in the way and to the extent which has been the case unless a number of gentlemen in the neighbourhood, one of whom is to follow me, had been willing to give it most liberal support. In any case the council have experienced a great deal of difficulty and a great deal of anxiety on this point of finance in the maintenance of the work. I should like to point out in that connection that although the existing grant of £800 which we get from the Board of Agriculture was undoubtedly a liberal grant some years ago, it is not commensurate with the amount of work and the amount of financial burden that now has to be undertaken. May I give one or two points in support of that? In the first place I would say that in the last ten years the stipend remuneration of those who teach in these departments has markedly increased. I do not know that I should say how much it has increased, but it is a matter of common experience that men engaged in this teaching command higher stipends than they used to do. I might incidentally say that I think that is the case in most other subjects also, but it certainly is the case in that subject, and the consequence is we are in a difficulty which I have no doubt is shared by other institutions of the same order in not being able to devote enough money to the remuneration of the assistant lecturers in these departments. The work at Reading would be very much better we feel, very much stronger at any rate, if we had a rather larger staff of men, if they were less absorbed, some of them, in the mere routine of teaching—their time is so closely occupied that some of those special enquiries which Mr. Percival will speak about, and researches, are very difficult under present conditions—but my point is, that notwithstanding the growth of the work, and notwithstanding the growth of liability with regard to stipends, the grant from the Board of Agriculture has remained absolutely stationary for 11 years, and that no doubt is one of the causes of our financial anxiety. Then in the second place I only state a matter I think of common experience, and it is that the grants in aid, from the County Councils, are increasingly difficult to obtain. That is always attributed, and as a member of two County Committees, I think I can say, with truth, to the fact that the Act of 1902 has compelled County Councils to devote an enormous amount of money to merely elementary work in the elementary schools and to the training of teachers. I notice that in the Board of Agriculture Report for 1906 it is pointed out that in 1903-4 the County Councils of England and Wales gave £32,146 in grants to Colleges and schools on behalf of agricultural education; in 1905-6, only two years later, the amount, had actually fallen to £26,880. That I think is one proof of my contention that as things are, and apparently as things are going to remain for some time to come, it is very difficult for a College like ours to be able to rely on getting a larger and larger measure of support from the neighbouring County Councils. My last point is one which I will state in the briefest way, but one which the Council feel to be most important, and it is that our development of horticulture is a development which was called for by the

demand for the teaching and a development which judged by the number of students who take these horticultural courses has been entirely justified. I might mention that when Lord Onslow went round the gardens in 1904 he made the observation that as far as he could see, nowhere in England was horticulture being better taught than at Reading, and an observation very similar was made, and in some ways even more decisive from a scientific point of view, by Mr. Haldane in October, when he went round the gardens and opened our new buildings. It was largely because of this recognition of the importance of their work, and of the emphatic recommendation of it that was made by Lord Onslow, that the Council petitioned the Board of Agriculture a year or two ago that this special work of theirs in horticulture, this development of the general agricultural work, might perhaps entitle them to an increased grant. The grant was refused, and I can convey with great difficulty the extreme disappointment of the members at Reading, some of whom have devoted not only a great deal of money but a great deal of care to the development of this work. The result of that has been to check to some extent the development of horticultural teaching. Twelve months ago the Council were obliged to resolve that, having regard to the fact that no grant was to be forthcoming for this work—it was not only a question of money, but a question also of official recognition—that the expenditure on horticulture must be restricted as closely as possible. I think the whole of our feeling—I speak now from the point of view of the Council and not as an agriculturist, which I am not—is that the work has grown, that it is growing, and that there are hardly any limits to its growth, provided that the grave embarrassment of making both ends meet is somewhat lightened. I think, my lord, those are all the points that I was called upon to deal with directly; but I shall be delighted to answer any questions if I am able to do so.

3853. You wish to add to the numbers of the staff, and you also think that the salaries which are given ought to be increased?—Yes.

3854. For that purpose you think larger grants should be given by the Board of Agriculture?—Yes, that is our opinion.

3855. You conduct lectures in the counties, do not you?—The College does.

3856. Are these lectures well attended?—Mr. Percival can tell you more exactly about that. I think the results vary a good deal from what I have heard. I have also heard—I speak as an outsider on this subject—that the value of a lecture does not always depend on the number of people who attend it—that some of the most useful of these occasional lectures may be attended by only half-a-dozen people.

3857. You also conduct agricultural experiments at various centres?—Yes.

3858. Are they watched by the farmers with interest?—That, I think, comes under Mr. Percival's evidence. They are watched with interest, but he has the details on that subject.

3859. How many of your students are resident, and how many are in independent lodgings?—How many of the agricultural students?

3860. Yes, perhaps you can give us the average?—I have not the exact number here, but I gave a return which showed that there were 60 horticultural and agricultural students. I think that I am quite safe in saying that more than 40 would be students whose homes are at a distance, if that meets the point.

3861. They would not be resident?—We use the word resident in another sense. They are non-resident in the sense that they have to live either in a hostel or in lodgings.

3862. Those who live in hostels you consider non-residents?—Yes; we speak of them as non-residents. Their permanent homes are not in the town.

3863. Then the women students are chiefly in the dairy, I suppose?—No, I should not say that they are chiefly. I gave particulars of the number of women students on page D. There are, for instance, 16 women doing agriculture and horticulture apart from dairying. I should say most of the women agricultural students who live in hostels are not doing dairying. I think I should be right in saying that.

3864. What are they doing?—Horticulture in most cases.

3865. There are more women students in the horticultural department than in the dairying department?—Yes, in horticulture and pure agriculture, there would be.

3866. What is the attitude of the farmers towards the institution?—That comes into Mr. Martin Sutton's evidence; he is to deal with that point.

3867. What is your experience with regard to the degree of preparation which your students have received before they enter the college?—That varies very greatly; it varies so much as to make it difficult to answer that question. Sometimes a student will come having had a very good school education; frequently that will be the case. For instance, we admit a certain number of lads who have been to public schools. On the other hand, no doubt, it is very often the case with the sons of tenant farmers that their education has not been very satisfactory.

3868. Are you in favour of the education which they obtain before they come to the College being of a general character?—Certainly, for the diploma students I think that should be the case as a general rule.

3869. You are not in favour of giving them a special agricultural secondary education?—I am not in favour of it in principle. The principle applies to other things besides agriculture, but I do not deny that some of the best students, I believe Mr. Percival will say, have been those who have done well at a farm school, such as Basing; I think that is sometimes the case.

3870. The Basing School is a school of practical agriculture?—Yes.

3871. Is elementary science given as well?—I think they do, but I am not quite sure on that point—Mr. Percival has just informed me they do do so, but it would be very elementary.

3872. Do you think that for students who cannot attend the College, whose education ceases at 16, institutions like the Basing Farm School are the type of institution which should be encouraged?—If their education is to stop at 16?

3873. 16 or 17.—I have very little experience of that matter. I hear about the Farm School a great deal on the Hampshire Committee, and my general answer would be that if the education is to stop at 16, I have no doubt a good deal that is very valuable could be taught in the preceding two years, and that experience would bear that out, but I have not had the experience personally before me.

3874. (*By Lord Barnard.*) I do not think you have told the Committee what is the governing instrument of the College. Is it a Royal Charter or what?—No, it is not a Charter—Articles of Incorporation.

3875. A limited liability company, in other words?—Yes, without profits. We are not a chartered institution.

3876. Have you ever contemplated it, and do you think there would be any advantage in getting a charter?—We are always so much troubled with the extent of our growth that we do not know exactly in what way we may have to extend.

3877. Have you any endowments?—We had an endowment in 1905. Mr. George William Palmer gave us an endowment of £50,000.

3878. How is that endowment invested?—In various securities. I have not the particulars here.

3879. Perhaps I had better ask Mr. Wright that?—Yes.

3880. Is there a Trust Deed?—Yes; there is a Trust Deed.

3881. I forget whether you told the Committee the usual age at which students come to you?—They may not enter the College under 16, but those who come to us are generally older than that. I have not estimated the average age lately, but I should think it would be over 18.

3882. Do the students who come to you have to go through any entrance examination or any other test as to their fitness?—They have not usually an examination of a formal kind. Our experience has been this: we used to have, and we still have if we need it, a written examination of a simple kind. It is referred to in the prospectuses and in the calendar, but we generally find that the student has already passed an examination which satisfies us that he is of sufficient intelligence to go on with the course of study, and sometimes we are satisfied on

the result of an interview, and by questioning a student and finding out what his record has been. We then are able to form an opinion as to whether or not he is able to undertake the course of study.

3883. You do not admit students indiscriminately?—No.

3884. Do you find that the method you adopt is a satisfactory method?—I think it is satisfactory in the stage at which our Institution has arrived. We are only 15 years old at present. Of course the time may come when we may exclude a little more severely.

3885. You told us that you think it is an advantage that a student who has been undergoing a course of instruction at a special farm school should have an opportunity of further continuing that instruction if he shows himself capable of it?—Yes.

3886. I do not think you mentioned the subject of ordinary secondary schools which are provided, as sometimes is the case, with agricultural departments or special classes in agriculture. Do you think that agricultural departments or special classes in agriculture, in an ordinary secondary school, are of any value?—I do not think I have ever had to do with a secondary school which had one. I should be inclined to be sceptical about it.

3887. Should I be correct in saying that in your opinion, in the case of a boy who has been at an ordinary secondary school, it would be better that he should simply go through the ordinary course and have no special instruction before he comes to you?—I should think on general lines it would. I do not see how they could do it in the practical way that would be requisite.

3888. Who actually have the appointment of the teachers?—The Council.

3889. What is the meaning on page 51 of your Calendar of Associates of Agriculture?—On page 52 will be found the explanation, I think. Those who have obtained diplomas in Letters, Science, Agriculture, Horticulture, Fine Art, or Commerce, are entitled to rank as Associates.

3890. Entitled under your Articles of Association, I suppose?—I do not think it is mentioned in the Articles of Association. The Academic Board has power to do that.

3891. It is a sort of quasi degree—a hall-mark as it were?—It is.

3892. What is your connection with the University of Oxford?—Apart from the circumstances of our foundation, which is not official, we are an affiliated College. That is explained in this Calendar on page 86.

3893. It is not merely an *entente cordiale*; it is a legal *nexus*?—Yes. A student who has done a certain course of work with us may go to the University of Oxford and get a degree on two years' residence there instead of three, but it has never been practised.

3894. Do you value your association with the University of Oxford?—Very greatly.

3895. You think it is of use?—Certainly. I do not think it is reducible into terms of cash.

3896. Quite so, I understand what you mean; I did not mean that. Do the staff of the Agricultural Department all reside in and about the College?—No one lives in the College; they live in the town.

3897. They are always on hand?—Yes.

3898. They give their whole time I suppose?—Yes.

3899. The object which the College has before it is to give a higher instruction in agriculture to all British subjects with special advantages, of course, to those who come from the counties?—Yes.

3900. Do you think it is an advantage that the College should be open to the whole British Dominions?—Undoubtedly.

3901. In the case of foreigners, they get those advantages too when they come?—They do.

3902. Do they pay any extra fees?—No, they pay no extra fee.

3903. They pay the same as a man who came from the North of England would pay, I suppose?—Yes, I should be very sorry to exclude the foreigners. I think they are a very useful element.

3904. You consider in the same way as Englishmen go to foreign schools that that is a mutual advantage

Mr. W. M.
Childs.

15 May, 1907.

Mr. W. M.
Childs.
15 May. 1907.

which ought not to be curtailed?—Yes, and there is this advantage at Reading, that there is a very varied and vigorous corporate life, and it has that energy largely because it is made up of many different elements. So I should be sorry to exclude the foreigner.

3905. One word as to the general principle of finance. You told us there was an increasing difficulty in obtaining support from the County Councils and you consider that you are entitled to look to the Government for some additional financial support?—Yes.

3906. Would you agree with me in the opinion that any such additional financial assistance from the Government should be conditional upon no reduction certainly in the support from the Local Authorities—you see my point?—Yes, I quite see your point, and I am familiar with the argument which applies to the Treasury money also, but I am bound to say that I think any very hard and fast rule of that kind at this stage in national education might be very adverse to the institution. The County Councils in our part of the world are extremely pressed for money. It is not a matter of goodwill or lack of goodwill.

3907. That I can quite understand, but there would be a risk would there not?—I agree.

3908. Of the Council saying "You have further help from the Government so you can do with less"?—May I say I think the Treasury do say that the amount of local contributions must be so much—not necessarily from County Councils. I am not quite sure that the County Councils would enjoy being—may I say—intimidated.

3909. You have been particularly fortunate in Reading in having had generous benefactors?—Yes.

3910. I do not know whether you are sufficiently acquainted with the agricultural community at large to agree with me that, as a rule, you cannot expect very large endowments or subscriptions from agriculturists?—I quite agree.

3911. The only source then would be the Government?—Yes.

3912. I understood you to say that all the contributing bodies were represented on your council?—Yes; that is shown on page 40 of the Calendar.

3913. I presume you would not object to having a direct representative of the Board of Agriculture on the Council?—No, I think he would be very heartily welcomed.

3914. The Trustees are really nothing whatever to do with your institution. It is a power which you have of appointing trustees or managers of other bodies, and that is in itself an advantage, and it is always found to

be, because it keeps you in touch with those other bodies?—Yes, that is the point.

3915. (*By Lord Belper.*) I only want to ask you one or two questions about the financial side of the matter. I see from the Income and Expenditure Account for last year there was an expenditure on the College of nearly £20,000?—Yes.

3916. That, I suppose, covers the expenditure on the whole of the work of the College?—Yes, the whole of it.

3917. A great part of that I suppose is for the scientific instruction?—Yes, there is science and apart from agriculture and horticulture there is fine art, music, commerce, and a great range of evening classes.

3918. I see the Treasury grant is over £4,000. I suppose none of that goes to agriculture?—I do not think that would be correct at all. In the first place, may I observe that it is not really over £4,000, although it might seem so from that statement. The annual grant hitherto had been £3,400; the £825 which you see below was a special grant which varies from year to year, and may not go on, for apparatus and books.

3919. I did not assume it was annual, but in that year you received, as a matter of fact, nearly £4,300?—Yes; and agriculture does undoubtedly receive benefit from that, because in the first place to take the smaller grant first, the books and scientific apparatus purchased with that money would be available for the use of the whole college.

3920. I am bound to say, in the way your accounts are presented, I am a little at a loss, because in the first place, I see you have got in the schedule marked "M," "University College, Reading, Accounts and Report of the Council for the year ended September 30th, 1906." Then you have a head for the College Farm, Shinfield, and then a head for the Department of Horticulture, but there is no head for the Department of Agriculture. I see there is a sheet marked "J" further back, which purports to give a statement of the accounts of the agricultural department?—This really concerns the Registrar more than me, but I think I am right in saying "J" is the sheet which is returned annually to the Board of Agriculture.

3921. I was rather sorry that you have not been able to give us an account of your expenditure and income on agriculture in the same way as you have done with regard to the College Farm and Horticulture. It seems rather an important omission?—Mr. Wright is perfectly prepared to answer that question. I could answer it, but I might make a mistake or two if I did.

3922. Might I just ask that question of Mr. Wright now?—Certainly.

Mr. FRANCIS H. WRIGHT, Registrar of the University College, Reading, called and examined.

Mr. F. H.
Wright.

3923. (*By the Chairman.*) Will you kindly give the answer to that question to Lord Belper now, Mr. Wright?—The answer to that is that the Board of Agriculture require us to present an account each year for a financial year ending on the 31st March. Those accounts are sent up annually to the Board. I have not presented a copy of that account, but that could be handed in as supplementary to the evidence if that is wished.

3924. (*By Lord Belper.*) That would give us something, but it would not give us what you have got under the two divided heads, the income and expenditure for the year ending September, 1906, so that we could see how much of this large expenditure goes to agriculture?—The account "J" is an account which I specially prepared yesterday, because I felt it was very desirable that an account should be prepared from the figures in account No. 1 of "M," in order to show something like a fair year's agricultural working. My opinion is that the account rendered annually to the Board of Agriculture is unfair, both to the Board and to the College, for the simple reason that we have always in that account two years overlapping. We are required to make a water-tight compartment for the year ending on March 31st for the Agricultural Department. The College accounts are made up to September 30th in each year.

3925. "J," you consider, gives a fair representation of the income and expenditure on agriculture for the year?—I think for the particular year which I have taken out, "J" deals most fairly with agriculture, and for this reason, that in "J" I have taken the grants from contributing counties at their full amount. In the account I should render to the Board of Agriculture, I should not put those figures in, because if you take Berks, a large sum should be apportioned to general education, and a great deal of work that is not agricultural. The same applies to Oxfordshire, where we do much evening work for residents in Oxfordshire. I have put in the whole of the grants from the contributing counties, £825, and on the other side of that account the expenditure upon agriculture totals up to £2,152; that is the actual expenditure entirely upon agricultural work. You will notice the next paragraph is "Estimated contribution due to the College for services rendered to the Department." In that case, from the statement "K" I tried to get the fair proportion to charge for the services rendered by the scientific staff to agriculture. I might fairly have taken one quarter of the stipends of the scientific staff, who were actually instructing agricultural students, but I have only taken one-eighth, because I wanted to present the most favourable case financially for the Agricultural Department.

3926. You have not credited this account with any part of the £3,400 grant?—That is so; nor the George Palmer endowment.

3927. I suppose your contention would be that it would be almost impossible to give a correct balance sheet showing the actual part of that grant which would go to agriculture and the charges for the work of the general staff which ought to be debited against agriculture?—That is so, but I may add one other point, which is important, that the policy of the Council in this matter has been against the publication of a strict agricultural account, for the reason that it is obvious that the agri-

cultural department is parasitic on the College as a whole, and that the publication of an annual statement of an agricultural account, would probably create some amount of dissatisfaction among the other departments of the college, which are going ahead, as will be seen from the comparative statement of net receipts from fees, on the right-hand page of account "M." For that reason we have not published an agricultural account, pure and simple.

3928. I am very glad I asked you the question, because it was not explained on the face of the account?—That is so.

Mr. F. H.
Wright.
15 May, 1907

Mr. W. M. CHILDS, M.A., recalled and further examined.

3929. (By Mr. Acland.) Would you admit that at present the College does as much work as its extremely excellent equipment in every way would enable it to do?—It does as much work as its staff can do, certainly.

3930. You have as many students at present as you can deal with?—I did not know that it was going to be put quite in that way. I think that we could probably deal with rather more students, but not many more, and we would have to add to the staff very quickly. In horticulture I do not think that we could take more than half a dozen students without having to add to the staff.

3931. If I asked is your chief lack money or students, you would say, money?—Certainly.

3932. You think you have at present a sufficient number of students to justify the expenditure upon them?—Yes, I think so, certainly.

3933. Do you desire to encourage neighbouring localities to send more students?—Yes, I think that one of the things a college like ours at Reading can do, is to give a year or two's advanced instruction and training to the pick of the boys and girls who come from the county secondary schools. I think that is a thing that this new college could do because, if I may be allowed just to mention what is in my mind so strongly, there is a type of promising boy, particularly at local grammar schools, who would be more happy and get more out of life generally at a place like Reading than he would if sent to a great University with inadequate funds. I speak there with some experience.

3934. Do you think, with the development of secondary education, and with the growing knowledge possessed by the farmers of Reading, there is likely to be a larger attendance of boys of that sort?—Yes, I think it will come; I do not think anything can stop it; in Berkshire, for instance, to mention one county only, there is an increasing provision of secondary teaching, but the fruit of that is hardly visible; it is only just coming.

3935. Do you hope that that increased use of the College by the agricultural population of the counties may lead to an increase in the contributions of the counties to your funds?—I think it will in time, certainly.

3936. Can you suggest any special reason why the three counties, Berkshire, Buckinghamshire, and Oxfordshire, so near to you, give such a very small proportion of their "whisky money" to agricultural education?—No, I do not know that I know of a reason for that. I presume you are not inferring that the sum they give to us is the only sum?

3937. No.—No, I do not know any particular reason. I think sometimes there has been a feeling, and sometimes a very active feeling, that a good deal of the money formerly rather lavishly distributed on peripatetic teaching in villages was not spent to much permanent advantage. I think there may be some reaction from that perhaps.

3938. Would you say that the tendency of the counties is to give less to agriculture than it was a few years ago because of pressure from other sides?—I am not in a position to say that from knowledge, but I should think it probably would be so.

3939. Do you think that any expansion of their grant to you would only be very gradual?—Yes, I think that is certainly the case.

3940. Therefore you do not think that any pound for pound method of contributing by the State would be a satisfactory method in your case?—I do not think it

should be done with too great rigidity. I do not think, judging from experience, it would be the smallest use going to a County Council and saying: "Unless you raise our grant we shall not get so and so." If it is put in a hard and fast way like that they might say: "We are very sorry for you"; but, on the other hand, it might be an inducement if it was put in some other way. It is the rigidity which I rather object to.

3941. Can you suggest any development of your work which would make the County Councils more likely to increase their contributions?—I do not think that is the difficulty. I think each year certainly the number of county boys and girls who get this instruction will increase, and that will convince them in time. I have no doubt about that whatever, but it may take time.

3942. You simply say they contribute very little because they have got very little to contribute?—I do.

3943. You cannot suggest any cure for that?—No, I do not think I can. The County Councils, as was pointed out the other day at a meeting of the Berkshire Education Committee, have very little choice; they have to spend their money on elementary education, whether they like it or not; they must do it; all the funds are earmarked for certain purposes.

3944. When your College is compared with other colleges, such as the College at Leeds, the County Councils contribute very little to you?—Are not the three Ridings of Yorkshire very much better off than the County of Berkshire?

3945. No, I think not, speaking as a North Riding Member of Parliament?—As Berkshire has been referred to, of course it must be remembered also that when the Berkshire Education Committee began its work it found an extraordinarily inadequate provision of secondary education throughout the county, and they have not yet finished their labours or expenditure in meeting that deficiency.

3946. You think the spirit is willing on the part of the counties to contribute to you?—I do.

3947. Do you think if they had increased grants from the State for secondary education money would be free to help your college?—I have not the smallest doubt of it.

3948. (By Mr. Staveley-Hill.) Do you do anything in the way of instructing teachers in elementary schools?—Yes, we have a day training college.

3949. In these lectures that were given in various centres, were they ever given to labourers?—I do not think they were given to labourers as far as I know. Do you mean the centres in the counties?

3950. Yes?—I should think that is probable, but I never gave any myself.

3951. You spoke earlier in your evidence, I think in the statement you made, of one of your late pupils having become a teacher in a grammar school. Is that a teacher of agriculture?—No; I think it was a teacher of science, but one has become a teacher of agriculture in a grammar school—one a teacher of science, and one a teacher of agriculture.

3952. Are there many grammar schools in your neighbourhood where agriculture is taught, and where there are such teachers?—No, I do not think there are.

3953. Would you consider it of great value if there

Mr. W. M.
Childs.

Mr. W. M.
Childs.

15 May, 1907.

were such instruction given?—No, I should not think it is much good in an ordinary grammar school.

3954a

3954. Not if taught by a properly-qualified teacher?—It depends so much upon what is meant by agriculture. If it is really very efficient nature-study teaching, I should think it would be very useful, but if it is more ambitious, and pretends to be agriculture and it is not, it might be rather mischievous. You asked me a question at the beginning that I should like to refer to—as to elementary teachers. I thought you were going to ask me whether the college had any course for specially equipping a teacher who was destined to go into a rural school. One of my colleagues, Dr. Keeble, will deal with that point particularly. But I should like to say that we do feel that we are just one of the places where a student intending to become an elementary teacher might get a thorough course, if encouragement were given to enable him to become a competent teacher in a village school. But at present, under the Board of Education regulations, practically nothing of that kind is done. I thought you were going to ask me about that.

3955. (By Lord Moreton.) Would you mind telling me whether the foreign students you referred to once or twice come to Reading especially to study agriculture or horticulture?—Both; and dairy work too. I should say probably more have gone into the dairy than anywhere else.

3956. You were asked several questions just now as regards the financial help supplied by the neighbouring counties and local bodies?—Yes.

3957. Do you think that the happy circumstances under which you have been situated at Reading, and by having very good friends who have been able to help you financially, has rather made outside bodies think that they need not trouble so much as they might otherwise have been expected to do?—No. I do not think it has that effect at all; on the contrary, I think it has been proved again and again, that as soon as an institution develops power and obtains a basis of endowment so that there is a guarantee that it will go on, the local authorities are disposed to think more favourably about it.

3958. (By Mr. Medd.) Some of the Treasury grant, I think you told us, goes to assist the Agricultural Department?—The Agricultural Department derives benefit from it.

3959. If not directly, indirectly?—Yes.

3960. It relieves financial pressure?—Undoubtedly.

3961. So that you are in fact in the agricultural department receiving aid from two State Departments?—Well, I think it is rather hard to put it that way.

3962. But it is so in effect?—Undoubtedly it is so in effect.

3963. I am very glad to hear that you are so aided?—My point would be there that inasmuch as the agricultural and horticultural departments have to make use of the scientific staff, whatever strengthens the scientific staff must be an advantage to the agricultural and horticultural departments; that is my point.

3964. In other words, if you had not, so to say, access to the Treasury grant, you would require further financial aid from other sources?—The College would not be so efficient.

3965. I suppose no portion of the Board of Education grant goes to the agricultural department—or could you say that that indirectly helps it?—Might I ask what grant you refer to?

3966. It is on your return M. in Income—"Board of Education grant"?—No, that does not go to agriculture in the least degree.

3967. With regard to the £800 grant from the Board of Agriculture, is that in any way earmarked when it comes to you?—Yes, it must be devoted to the purposes indicated—for buying books and apparatus, and you have to submit before you get it a list of the purposes to which you propose to devote it.

3968. I am referring to the £800 grant from the Board of Agriculture. You are taking the Treasury grant?—Yes, I am very sorry—I do not know that that is earmarked.

3969. You get it *en bloc* and you appropriate it as you think best?—Yes.

3970. You have to render an account as to how you

spend it, but it comes to you with free hands?—That is so.

3971. Can you give me any idea, roughly, of the amount that goes to the support of the horticultural department out of that £800?—I am not sure that I can; I do not think we have ever assigned a specific portion of it.

3972. There again the horticultural department would to an appreciable extent be benefited out of that?—Yes. You see to have done that, if I may be allowed to point it out, would have meant in the year 1902 deducting something from agriculture for the benefit of horticulture and that is not a process that one can very well do. There is no differentiation on this point between agriculture and horticulture.

3973. I noticed you said you had applied specifically for a horticultural grant?—It is only a question of form I think; we applied for an increase of our grant, because of the increase of our horticultural work.

3974. Obviously the horticultural department must be benefited to some extent by the £800 from the Board of Agriculture?—Certainly it is.

3975. In regard to the expenditure of money by these affiliated counties for the benefit of agriculture, do you not think that if your connection were somewhat more close with them that their contributions might be raised. I see for instance that Hampshire spends almost half its "whisky money" upon agriculture. That presents a very striking contrast to Berkshire, Buckinghamshire, Oxfordshire and Dorset?—Yes.

3976. As a matter of fact your connection to-day in agricultural education with those counties is very slight?—Very, except in the case of Hampshire where there is a more direct relationship.

3977. Do not you think you could establish a very much closer connection?—In what way?

3978. By acting actually as the collegiate centre for the whole agricultural education of that area—you are so in name to day?—That is what we wish to be, if I rightly understand your use of the term.

3979. Do not you think that you might, by consultation with the agricultural committees or local authorities of those respective counties annually, devise a scheme to cover the whole agricultural education of each county from the elementary school upwards?—I do not think that that would be impossible at all, but I am strongly of opinion that to launch an idea like that, which is a very large idea, successfully, it ought to be done from the central authority in London.

3980. I hope it may be of course. At present you see although these counties are upon paper affiliated to you they are actually in all their agricultural education work really working in isolation, and only coming to you occasionally for advice?—Yes, it is so.

3981. I think you would agree with me that if you could annually meet and devise a scheme appropriate to the needs of each area under your auspices and advice, it would tend to fill up gaps, prevent waste, and also prevent many useless experiments being carried out?—Yes. I think that would be the case. I hope it would not mean that excessive demands would be made on the regular college staff to go on excursions through the counties lecturing, and so on.

3982. No, I think that would have to be left, at any rate for the present, in abeyance, because your staff are fully occupied, but if the scheme I have in mind were carried out, it would tend to an increase in your staff, and your staff would be only partly utilised. May I take it that your view of the agricultural connection that you have with these areas is merely in so far as they provide pupils for you and you give advice on agricultural matters when asked?—Those are the two main things.

3983. The result is that in those areas, with the exception of Basing, there is practically no provision made after the elementary school in which a pupil can be prepared and qualified to come on to you?—Yes.

3984. In intermediate education there is practically nothing in agriculture?—I think that is so.

3985.—You were going to explain to me the more direct relationship of the county of Hampshire with you?—It is only a small point. I am on the Education Committee of Hampshire, and Mr. Percival is on the Advisory Agricultural Board—I think they call it—so

they have recognised that need, although they do not subsidise the college.

3986. They have their own institut^e at Basing, and that absorbs £1,900 a year?—I was going to say in reply to your argument that the first difficulty would be this: that those who have nurtured the agricultural school at Basing into prosperity would not be pleased to deduct any of their money to send to someone else.

3987. It would come in in a well thought-out scheme, and Basing would still retain its position and character. Then in regard to the winter courses, you have very few students—the six months' winter course?—Yes.

3988. How is that, do you know—there are only six or seven I think?—There are from six and seven to 14; it varies each year.

3989. It is intended for the sons of working farmers, I suppose?—Yes.

3990. Has the number of students tended to increase of late, or not?—Generally, do you mean?

3991. Yes, there are 60 altogether?—Yes, it has tended to increase very much, especially in the last five years—the increase has been marked during that period.

3992. From 1895 to 1902 you had a nature study course?—Yes.

3993. Why have you dropped that?—Because the County Council of Bucks—to which I think you are referring—

3994. Yes.—Withdrew the money which enabled the teachers to attend it. I think I am right in saying they did not withdraw the money from us but from the teachers who had previously received the money.

3995. In your answer to Mr. Staveley-Hill you referred to the ordinary day training college, of course?—Yes.

3996. You do not provide any course of study for acting teachers at present in nature study or agricultural teaching?—No, I do not think we do.

3997. Do you not think it might be well to institute a course for them such as they have at Wye?—Yes, I think so certainly, if there is any demand for it.

3998. You referred to a desire to introduce a special course for teachers?—Yes.

3999. Perhaps you are not aware that the Board of Education will recognise such a course, and will provide scholarships for a third year's training at such an institution as yours, if they are applied to?—I am not aware of it; and I think, if that is so, that it is singular that such an Institution as ours should never have been approached about it.

4000. There never has been an application anywhere in England, but might I suggest, since you are prepared to do it, that you should submit a scheme at once to the Board of Education?—My answer to that is that a single institution cannot deal with a point of that kind.

4001. Two institutions are already submitting them?—Have they gained their end?

4002. Yes, one has, and the other will succeed?—That would encourage one to persevere. I have had much to do with the courses for the training of teachers, and the difficulties connected with any departure from the beaten track are enormous.

4003. The Board of Education are going to make that clear. There are already two courses which will be submitted for approval very shortly, and I should suggest to you that you might submit a scheme?—I am obliged for the suggestion.

4004. (*By Lord Barnard.*) On looking through the calendar here I see you prescribe an academic costume?—Do you mean for the students?

4005. Yes?—All the matriculated students wear cap and gown, certainly.

4006. A cap and gown?—Yes.

4007. (*By the Chairman.*) Are you of opinion that it would be desirable that the University of Oxford should recognise residence at your College at Reading for the Oxford Degrees?—That is a most difficult question to answer, my lord. The proposition was made in 1898, and it was rejected by Convocation.

4008. Do you consider that the external degrees at present given by the University of London are an object for which you can work?—They are at the present time.

4009. How many students have you working for the external degrees of the University of London?—70.

4010. As many as that?—Yes.

4011. Would you not from an educational point of view consider it a great advantage if those external students could be transformed into internal students?—Yes; I believe there is a certain educational advantage.

4012. You are aware that the Wye students are considered as internal students?—Yes, I am aware of that.

4013. And you know how it works?—Yes, generally speaking.

4014. Do not you consider that there is an advantage to Wye in having their students considered as internal students as compared with your students who are external students?—Yes, on that particular point I dare say that may be so.

Mr. MARTIN J. SUTTON called and examined.

4015. (*By the Chairman.*) You are a member of the College Council of the University College, Reading?—I am.

4016. You are prepared to give the Committee your opinion as to the types of work conducted by the institution which are of the most value to agriculturists?—May I say one word before I answer your question?

4017. Certainly.—I was asked by the college authorities to give evidence from the point of view of a resident in the counties of Berks and Oxon for the last 30 years, who realises the needs of the locality and has some personal knowledge of the work of the college. My evidence is, therefore, of a very general and detached character, and I should be greatly obliged if before answering any questions which may be put to me, I may read a few notes that I have hastily put together this morning, covering the various enquiries which have been allocated to me, but perhaps not in sequence exactly corresponding with the heads of enquiry as they have been placed on the paper sent me.

4018. Certainly.—Dividing the work of the institution with which this Committee is concerned into those departments broadly connected with agriculture and horticulture, I should say as regards agriculture, that scientific teaching is the most valuable and most sought after; whereas on the horticulture side it is the practical work which is most in evidence, and perhaps that for which the greatest demand exists at the present

moment. I think I may say this without undervaluing in any degree the excellent practical work done in agriculture or the specially good scientific training provided for the horticultural student. It is evident that practical agricultural teaching is easily obtainable on the ordinary farm, whereas it is difficult to obtain a teaching in practical horticulture, except at some institution like that at Reading; and Reading possesses advantages of a very special kind. This latter fact greatly impressed both Lord Onslow and Mr. Haldane, when they visited the College. In the case of the sons of landowners and large farmers, the full course for the Diploma in Agriculture, covering the syllabus of the National Diploma in Agriculture, and involving at least a two years' attendance, is an admirable preparation for their life-work. The one additional year necessary to obtain the Diploma with distinction may well be afforded by young men who desire to become teachers of agriculture or agents of large landed estates. As a proof of the value of the Diploma course to those who are engaged in agriculture on a large scale, the following passage may be quoted from a letter dated May 11th, 1907, from Mr. George Judd, of Cocum, Barton Stacey, Hants:—

"I am glad of the opportunity to assure you that I have always been well satisfied with the usefulness of the course of teaching which my sons took at Reading University College."

The courses in question taken by Mr. W. V. Judd and

Mr. W. M.
Childs.
15 May, 1907.

Mr. M. J.
Sutton.

4018a

Mr. M. J.
Sutton.

15 May, 1907.

Mr. E. T. Judd were the diploma courses in agriculture.

"They are both doing well as practical farmers. The senior is farming 800 acres on his own account near Andover. The other practically manages my large business of 3,000 acres, while he has just been invited to serve on the Farm School Committee of our County Council Farm. There can be no doubt that the technical and scientific knowledge acquired by them during their pupilage at Reading will be of lasting benefit."

Mr. E. T. Judd writes himself to say that he manages practically all the details of the tillage, harvesting, etc., on his father's farm of 3,000 acres, and generally supervises the management of the cattle, and the flock of a thousand pedigree Hampshire ewes. He states that he considers that the course he took at Reading was a very good one, and that it has been and will continue to be of good service to him as a farmer. In view, however, of the interest now being manifested in the question of rural depopulation, and the need for the provision of educational facilities, not only for the small farmers' sons, but such as will enable the sons of the agricultural labourer to obtain an insight into the importance of the scientific treatment of land, even under the conditions of "petite culture," the Reading College very rightly offers, through its certificate of agriculture and the short six months' winter course involved to obtain it, exactly the opportunity and conditions required by County Councils desiring to help youths by scholarships. While the College naturally prides itself on its Diploma, and very probably would never be satisfied to recommend anything less than a two years' course of scientific and practical agricultural teaching, yet I personally think there is a still greater future for the six months' certificate course, just as in practice it has proved to be the case that the certificate course in dairying (October to July) is more popular than the two years' course in scientific and practical dairying. It would appear to be very desirable that the County Councils, particularly in the neighbourhood of the College, should utilise to the greatest extent this short course for the benefit of a type of student with which they have to deal in large numbers. In some instances County Councils have established farm schools of their own; and the lads in attendance at these schools go through a course of instruction similar in some respects to the six months' course in agriculture given at the College at Reading. Provided these lads are below the age of 16, there is no danger of overlapping; but, on the other hand, when they are over the age of 16, it will be obvious that a fully-equipped institution such as the College at Reading can deal with them far more effectively than any small local school. Unless this fact is grasped there would appear to be some risk of uneconomical duplication of effort and expense. For the elder lads, scholarships might be offered by the County Councils in larger numbers than at present, to enable them to go through a winter course at Reading. On the other hand, it is equally desirable that encouragement should be given to those who are in a position to take the longer Diploma course, and I should be sorry to popularise the shorter course of instruction to such an extent as to starve the longer diploma courses. As regards your question as to the views of the average agriculturist on agricultural teaching, I may perhaps say a word. Having now served on Agricultural Education Committees of our great Societies and other bodies for 30 years, I notice a very distinct change in the attitude of agriculturists towards such work as that carried on by this college and other similar institutions. Formerly, agricultural education was supposed to be calculated only to produce a theorist, who was out of touch altogether with practical work, and it was the divorce of such education from practice which occasioned those lamentable examples of failure which were subjects of derision on every country side. While the English agriculturist is just as decided as ever that science alone will never make a farmer, yet he is beginning to understand that the practical farmer can learn a great deal from science, as a hand-maid to practical agriculture, and the scientific teacher is learning on his part to be less "cock-sure" as to the practical value of any single experiment, and is realising to a greater extent than hitherto how exhaustive such experiments must be, and how necessary it is that they should be repeated under all conditions of soil, climate, and variations of rainfall, before it is safe to dogmatise on any subject whatever, still less to recommend, off-hand, any considerable

departure from the farm customs and methods of tillage in use in any particular district. On the part of the ordinary farmer there is a greater disposition to appreciate the value of expert knowledge and the uses of experiments. In support of this general opinion Mr. Percival will mention (1) the willingness of farmers to devote land for experiments (2) the increasing number of enquiries addressed by farmers to the agricultural department. It is perhaps more appropriate, however, that I should lay stress on the fact, which Mr. Percival and Dr. Keeble can hardly be expected to emphasize, that practical farmers and gardeners have exhibited remarkable readiness to attend courses of lectures by these gentlemen at Reading. It may safely be said that while a farmer or a gardener may, without much difficulty, be tempted as an experiment to go to a single lecture, he will not attend a whole course of such lectures unless he is convinced of the practical advantage of so doing. A class of about 40 gardeners from Reading and the vicinity has attended weekly lectures throughout a whole session. These lectures were given chiefly by Dr. Keeble, although some of them were delivered by Mr. Percival. Quite lately Mr. Percival has given four lectures in Reading on "Artificial manures—their nature and use." These lectures were attended by an audience of from 20 to 30 farmers, some of whom came a considerable distance. The information on such questions as milk, manures, seeds, etc., which Mr. Percival has thus been able to impart in a popular and pleasing way, has been greatly appreciated. Perhaps, however, and here I speak from my own personal views very strongly, the greatest need of the present day is an opportunity for affording to the elementary school teacher, male and female, facilities for acquiring that knowledge of the rudiments of agriculture and horticulture which shall enable them to interest their scholars in country pursuits. The Saturday course for teachers in practical horticulture at the College Gardens during the autumn and winter has been greatly appreciated by them, while the certificate in nature study, awarded after a two weeks' course in August, with such a subject of instruction as "The choice and use of a school garden" has in past years proved extremely valuable and has met a great need. It is extremely disappointing that County Councils do not more fully realise the importance of affording teachers pecuniary assistance to enable them to take advantage of these opportunities. Useful as these short courses are for the existing staff of elementary teachers, the certificate in horticulture course of 40 weeks is even more essential for every young person, of either sex, who desires to qualify for the teaching profession in the future. Such qualification will be increasingly demanded by rural educational authorities, and Reading University College, by providing such facilities, is in a marked and very special way evidencing its great national value as a normal school of horticulture.

4019. It is your opinion that elementary teachers should attend these horticultural courses of 40 weeks?—Yes, it is, but not existing teachers. The existing teachers could not attend those certificate courses; they could only take the Saturday, or the two weeks' course in August.

4020. Your opinion is that for teachers who are going to rural districts it would be an advantage for them if they could obtain the Horticultural Certificate?—Yes. Before they become teachers they should obtain that certificate most distinctly, and there is Reading College at the present time prepared to meet that need which I consider a crying need.

4021. Do you know anything of the Farm School at Basing?—I know of it, but I have never visited it.

4022. Is that a school that you can recommend?—Yes, for boys up to the age of 16 years, and then I say that Reading College is the very place for them to go on to.

4023. You look at the Basing school as a good preparatory centre for the students who come to Reading?—It is good for those who cannot go any further, and who have to go to work at 16, but it is still more useful for those who are able to come on to Reading College.

4024. With regard to the lectures, do you attach great importance to lectures being given throughout the county?—I can only speak of those that have been delivered in Reading. I have attended some of them and I consider them of very great service. I believe they are equally as useful when our Professor of Agriculture goes down to Dorsetshire and gives lectures

there, but I do not think Reading College is in a position to send peripatetic lecturers all over the adjacent counties at present.

4025. I do not mean that the college should send them, but do you think lectures are an important element?—I think they are very important, and also that it is very gratifying to find that farmers are very willing to come to them now, as they were not 20 years ago.

4026. And that the lectures should be accompanied by experiments?—I presume you are not speaking of demonstrations in the room in which the lecture is given, but experiments and demonstrations on the land?

4027. Yes.—Yes, such field experiments are most desirable.

4028. Experiments carried out in the summer, afterwards illustrated by lectures given in the winter?—Yes, certainly, and lectures also on the experimental field; farmers would be only too delighted to go and have an experiment explained to them just as Dr. Voelcker has for many years at Woburn.

4029. You attach great importance to the work of research that is carried out at the farm?—Most certainly, and I hope that it will be very much developed, but of course that makes it all the more necessary that the staff should be increased, and it makes it difficult for us—I am speaking now as a member of the college—to spare our professors to go about giving these popular lectures.

4030. More money should be spent on that department, you think?—We certainly want more money for that; I am sure it could be spent with advantage.

4031. (*By Lord Barnard.*) I gather from what you have told us with regard to the elementary school teachers, that you would not agree with one witness who came before us, who informed us, that, in his opinion, the curriculum for the instruction of elementary school teachers was already so overloaded that it was barely possible to carry it out satisfactorily, and that it was impossible to add to it, and that a 40 weeks' additional course would be a very serious burden to the budding elementary school teacher?—Yes, I quite appreciate that difficulty.

4032. You attach great importance to the suggestion that County Councils might most usefully expend their funds in developing higher instruction in agriculture in the granting of scholarships so as to enable clever boys from the county, who otherwise would not get such an advantage, to have the advantages of your college. You attach great importance to that?—Very great importance indeed.

4033. With regard to the possibility of overlapping to which you referred, have you any scheme in your own mind as to how that could be prevented?—Yes. My point is that the County Council with their farm school should not go beyond the age of 16.

4034. How could you prevent them?—I do not know about preventing them, but we could urge the importance of the boys going on to institutions like Reading and Wye and other places where they have a far more efficient staff and where the appliances are up-to-date. No county school could possibly offer such advantages.

4035. Would you approve of anything like a central authority which would have an advisory power, such as the Board of Agriculture, and a consultative committee?—Quite

4036. (*Mr. Acland.*) Can you suggest any development of your college work which would be likely to induce increased grants from the neighbouring County Councils?—I have never heard of any desire that we have not been glad to fulfil. I do not know whether we have thought of everything that could possibly be an inducement, but we certainly have never refused anything that has been desired.

4037. You do not think any deficiency in your college work is the cause of the smallness of the grants?—I do not at all. I quite agree with what the Principal has said about the County Councils in our neighbourhood being very friendly to the College, and they would be delighted to give more money if they had it to give. I was on the Oxfordshire County Council myself for many years and I know that the most friendly feelings exist between them and the college.

4038. There is an equal distribution of "whisky money" in the case of all the County Councils, and can you suggest any reason why these particular counties should give so little compared with what the

other counties in England give where they have an agricultural college?—I was not aware that we were so far behind.

4039. It is unfortunately so. You stand very far at the bottom with regard to grants from the County Councils.—Of course we are very much behind in secondary education. Secondary education will swallow up a great deal of our money for some time, and that has no doubt partly accounted for it. I think one suggestion that was made, that perhaps the large sums that have been given privately have injured the position of the college in the eyes of the County Councils, can hardly be the cause, because I think probably the fact that the college is looked upon with satisfaction by the County Councils and public bodies, encourages private individuals to give. I know it is so in some cases.

4040. You cannot suggest either a cause or a cure for the comparative smallness of the County Council contributions?—No. I think it is for the members of the County Councils to realise the need more fully than they do now of scientific education for the farmer.

4041. You live in hopes that they may gradually come?—Yes, because I have seen such an immense change in that direction in the last 25 or 30 years.

4042. (*By Mr. Lamont.*) I should like to ask you whether any students from the Colonies take the horticultural course?—I am afraid I cannot answer that question definitely, but of course there are others in the room who can. (*Mr. Childs*) Some do.

4043. Can you tell me if any of the horticultural students come from a tropical country. (*Mr. Childs*) I do not think so.

4044. (*To the Witness.*) Can you tell me whether the horticultural course would be of any use to students coming from the tropics?—(*The Witness.*) I should hardly think so.

4045. Take the West Indies with which I am well acquainted, it is extremely difficult, almost impossible out there to get men who have any knowledge whatever of scientific horticulture, and with the great development the fruit trade is undergoing just now, it is extremely important that we should get some men who have a knowledge of the methods of the improvement of fruit culture and the gradual development of the various kinds of tropical fruit trees, and what I wanted to know was if you thought it would be of any use if your British students were invited to take up posts out there, and whether their training in horticulture at Reading would be of any use to them in tropical fields?—I know that one student at Reading has been a great success in Egypt, and that is half way to the tropics. The Director is here, and he will be able to tell you much more about what is offered in the way of instruction there, but I should certainly think it would be an extremely valuable thing for a man, seeing what an up-to-date English horticultural education means.

4046. Supposing, to put it in the other way, that West Indian students came to you to complete their course of training after having gone through a course in an agricultural secondary school, do you think they would then go back probably better qualified for the management of a fruit farm in the West Indies than they otherwise would be?—They must do so; there would be no doubt about it.

4047. (*By Lord Moreton.*) I am not quite sure I clearly understood you when you mentioned the short courses. I think you said something about labourers' sons being unable to attend them except by the aid of scholarships?—Yes.

4048. Have you had any cases of *bona fide* labourers' sons coming under those conditions?—I do not think we have ever had a scholarship which has brought them—gardeners' sons but not agricultural labourers. What I hoped was that Reading would be as it were at the top of a ladder beginning at the elementary school, going through the Basing type of school, and then coming on to Reading.

4049. Do you think the son of an ordinary agricultural labourer could afford to come unless he had a scholarship?—He would have to have a maintenance scholarship as well.

4050. Would you mind telling me what, in your opinion, would be a sufficient sum for a labourer's son to come there with a scholarship?—Do you mean for maintenance exclusive of the college fees?

Mr. M. J.
Sutton.

15 May, 1907.

Mr. M. J.
Sutton.
15 May, 1907.

4051. What would it cost a labourer's son first of all to come?—For a forty weeks' course?

4052. For a short course?—I do not know what the college fees would be. I think that is a matter for the College officials. I do not think I should be able to answer that question, my Lord; I am very sorry.

4053. (By Mr. Latham.) You spoke of the sons of large farmers and landowners coming to the College. Do they come in large quantities?—No, I do not suppose they do.

(Mr. Childs.) There is a very distinct proportion of large farmers' sons.

(The Witness.) I am not in a position to answer with regard to the figures.

4054. There are many men in a much larger way than Mr. Judd who do not take any interest in the College in the way of sending their sons, are not there?—I should not have thought there were many men who were in a larger way.

4055. Yes. Many that I could mention. I am a member of the Berkshire County Council. Do not you think they have wonderfully gone back in the assistance they extend to agricultural education?—In the actual amount of money they allocate to it, do you mean?

4056. The interest they display in it I would rather say?—I am not on the Berkshire County Council, and I do not know.

4057. I am. We used to give scholarships to the College, I believe. I know several boys who went to the College at Reading and I look upon it as a disgrace that we only give the small contribution that we do towards it?—I agree.

4058. We have no agricultural committee on the County Council. Do you not think that is a great loss to the agricultural interest?—Yes, certainly.

4059. Why is it that you are so fond of the winter courses? Do you not think summer courses would be beneficial?—Do you think a farmer's boy could be spared from the farm so well in the summer as he could in the winter?

4060. That may be so, but I was thinking that there was so much more to teach them in the summer than there is in the winter?—On the land?

4061. In every way?—Of course the supposition is that the boy has a chance on his father's farm of doing a great deal on the land, and seeing a great deal on the land, in the summer, and that he can utilise his time much better by going to these classes in the winter. Of course for practical teaching the summer is the best time of the year, and he goes to Reading usually for theoretical teaching.

4062. After he has had a good spell outside, away from school, do you not think it very much unfits him for coming back to inside study?—That is the old argument. If it is a question of a diploma, the probability is that if he takes his practical work outside with his father for a year or two after leaving school he is unfitted for buckling to again for his diploma course. But I do not think that applies to a winter course. The diploma course is a totally different thing from the winter course that is provided at the College.

4063. You said there was a great service rendered to agriculturists by the laboratories. Do you not think the Fertilisers and Feeding Stuffs Act has had a great tendency in that direction?—You are not speaking of the last Act?

4064. Both of them if you like. Of course farmers thought nothing about it until the last Act came into force?—In that respect they have been very useful, but whether in any other respect is a question.

4065. I suppose the last Act has been of the greatest benefit to agriculture?—I am very dubious indeed myself as to its results proving to be of any general benefit.

4066. (By Professor Middleton.) You said in your own experience you had found that the farmer was learning to appreciate scientific work?—Yes, of late years.

4067. Could you give any reasons for that appreciation. I think you have already stated it in your statement, but I did not quite catch it. Why has that change of attitude taken place?—I think it is on account of better education.

4068. The farmer himself is better educated than he was?—He is better educated than he was 30 years ago; there is no doubt about that.

4069. Is there any difference in the method of teaching; you said the scientific teacher was less cocksure now than he was as to the practical results of his experiments?—The sons as well as the farmers themselves have learnt more.

4070. They have both improved within the last 25 or 30 years?—Yes. I think the farmer is more willing to learn now when he finds that the professor realises something of the difficulties of the calling.

4071. That is exactly it; when the farmer realises that the scientific man understands his business, the farmer is then willing to listen to him?—Yes.

4072. That is the change that has come over them?—Yes. I am thinking of the difference between Mechi's time and the present time.

4073. When the farmer comes to the scientific man you will agree with me in saying that what he wants is expert advice?—Yes, quite.

4074. He does not want general teaching; he wants certain problems which have troubled him answered?—Yes, you are now thinking of the adult farmer, the man who would attend these lectures on market days.

4075. Yes, and you agree with me, therefore, that the change in his attitude is largely due to the fact that the advice which he now gets is very much more satisfactory than he was able to get 25 or 30 years ago?—Yes, quite.

4076. (By Mr. Medd.) What should you consider to be the main defects in the agricultural labourer to-day—the man whom you have to employ?—In education?

4077. In general ability, intelligence, aptitude, or skill?—They are none of them actually so clever at thatching and hedge laying and ploughing or any other operation as they used to be.

4078. It is more difficult to obtain a skilled labourer than it used to be?—Yes, no doubt.

4079. And the handyman, so to say, has disappeared almost?—Yes, usually.

4080. The intelligence of these men is very defective as a rule?—Yes, probably, because the best go away from the agricultural side of the country altogether; they are educated for other walks in life.

4081. You agree that a great deal of that might be remedied by more appropriate teaching both in the elementary day and continuation school classes?—Yes.

4082. You have found that these courses for elementary teachers in Oxfordshire have been and are doing a great deal of good?—Yes.

4083. In Oxfordshire you have done a great deal to encourage school gardens and allotment cultivation, have you not?—Yes.

4084. By shows?—Yes.

4085. Could you describe the organisation of those shows and the giving of prizes. Where are they held—at different centres?—I have been off the Oxfordshire County Council for two years, and I am not quite prepared to give you an answer as to details.

4086. As a matter of fact more has been done by that County Council than by most counties to encourage school gardens and allotments?—Yes, we took it up very seriously.

4087. Perhaps you will agree with me too that similar work both for the teachers in the continuation schools and the day schools might be stimulated by a little sympathetic inspection by the Board of Education?—Yes. We have the facilities for carrying on nearly all that we wish to do, but of course we want a little more sympathy as you say, but the main difficulty is to find a teacher sufficiently instructed in nature subjects to enable him in a rural school to carry out the wishes of the Committee. That is why I am so very desirous of seeing Reading a centre where existing elementary school teachers can be coached for such a purpose, and where courses can be obtained like the 40 weeks' course for those who wish to become elementary teachers in the future.

4088. You feel it would be of great advantage if a few selected existing teachers could be sent for a third year's course to a place like Reading?—Certainly.

4089. Have you had any opportunity of studying Lady Algernon Gordon-Lennox's work at Banbury?—No.

4090. Not the grouping of the villages there?—No.

4091. It has been suggested that the Board of Education should become responsible for all educational work. You have great experience, and would you prefer the Board of Agriculture to retain the agricultural work rather than have it transferred?—Certainly.

4092. You are strongly in favour of developing an agricultural department at Oxford University?—Yes, and have been for years.

4093. A department which shall be capable of giving a degree or a diploma in agriculture?—A degree.

4094. And that Oxford should be quite on a level in that respect with Cambridge?—Yes.

4095. And occupy the same position in relation to the Western Counties?—Yes, most decidedly.

4096. I believe you most generously, a few years ago, offered to promote that work?—Yes, I did make an offer.

4097. Would you explain to the Committee the offer you made?—I do not think I am at liberty to do that.

4098. You were quite prepared to do for Oxford what Sir Walter Gilbey has done for Cambridge?—It would not be proper for me to state the exact nature of my offer, but it was in that direction, and a definite sum was named as that required for the initial outlay, which sum I guaranteed. I was very desirous that there should be the same opportunity for agricultural teaching afforded at Oxford as my friend, Sir Walter Gilbey, had arranged for at Cambridge. It was disappointing to find that the authorities could not see their way to accept my offer or to take any steps in the matter of an agricultural degree.

4099. The project now has come nearer, and I hope you will support it as strongly as you did before?—I am very glad to hear it.

4100. (*By Mr. Davies.*) I think you belong to the County Council of Hampshire?—No. For years I was

on the Oxfordshire County Council, but I was obliged to retire through ill health.

4101. Does the Oxfordshire County Council contribute towards the agricultural department at Reading?—I am told that it does.

4102. Are there any scholarships?—The Registrar will give you that information.

4103. With regard to dairy work in the College, is there any overlapping between the Dairy Institute at Reading and the dairy work which is carried on by the agricultural department of the University College?—No, they are one and the same; they are all at work together. The British Dairy Institute is the property of the College, but it is worked by a Joint Committee of the B.D.F.A. and the College, and the practical teaching at the dairy and the theoretical teaching of the College in dairying are worked together; it is all one and the same.

4104. I understand that the College sends lecturers to give lectures here and there throughout the counties; do you think there is any chance of also starting classes in the country districts for farmers' sons and labourers' sons, as a stepping stone for them to such a school as the Basing school, and afterwards to the College at Reading?—Do you mean evening classes?

4105. Yes, or classes lasting for a month in certain districts. Such classes have been tried in other parts of the country and have been found to be successful?—Of course we have no staff available for such a purpose in Reading at the present moment. Do you only ask whether I think it would answer the purpose?

4106. Yes, in bringing more students to the College?—I do not think myself it would be of any practical value in agricultural teaching. You think it would give a stimulus to the boys to take an interest in such, but I would rather depend upon the elementary school teacher, and his giving instruction in his own nature studies and kindred subjects on his own account rather than sending out professors from Reading to give any extra special evening classes. I should be very glad to see an elementary school teacher fitted to carry out that work himself.

Mr. M. J. Sutton.

15 May, 1907.

MR. JOHN PERCIVAL, M.A., called and examined.

4107. (*By the Chairman.*) You are the Director of the Agricultural Department of the University College at Reading?—Yes. It has been suggested that I should offer evidence with regard to field experiments more particularly and local lectures, as well as the use of the College as an institution for the giving of scientific instruction and expert information on other subjects connected with agriculture. The scheme of field experiments which has been carried out at Reading, has been very much in the nature of those which have been carried out at other centres—at least formerly it was the case—single experiments dealing with manurial problems and experiments, which were more or less demonstrations. Recently I have been rather inclined to take up only one or two subjects than a heterogeneous lot of experiments, and to deal with those subjects on a larger basis in order that we should get some definite evidence which could not be obtained by single experiments carried on for a number of years. I have attempted to multiply the centres dealing with one particular individual problem. Swede experiments, for instance, have been carried out on 26 farms, all having the same kind of experiment. It seemed to me that that was the only way in which we could get conclusions which would be free from errors due to the irregularities of soil and season, and not only with regard to swedes, but with regard to experiments on grass land. I have been trying to carry out the same sort of idea in Berkshire and in the other counties associated with the College. It has always appeared to me that those experiments which have been going on are not carried out on sufficiently large a scale to give any sort of conclusive evidence one way or the other, and especially if they are only carried on for one year and then pulled up and taken away to another locality. My particular aim would be to get 100 farms in each county all doing the same thing, so that we could settle once and for all certain

obvious problems, and possibly we might get evidence on the question of irregularities which are very puzzling, and which are always a trouble in connection with experiments. Moreover, I have been attempting at the same time to endeavour to get definite analyses of the fields on which the experiments are carried out. At the present time we do not seem to have much evidence with regard to the connection between the analytical figures obtained from analyses of the soil, and their bearing upon practical results, and I thought that if we could have these experiments carried out on one single subject for three or four years on perhaps 100 farms, if possible, and get analyses of the actual soil not only in the neighbourhood but in the surrounding areas we should be making some sort of progress independently of merely showing and demonstrating certain facts, and that we should be making a real contribution to scientific investigation in problems of this sort. Of course, the experimental work itself is a very difficult matter to carry out from a central institution without some local aid, and at Reading it has been the policy of the department to try and get the County Councils to make appointments of lecturers, which is a matter with which I will deal later, who would be responsible more or less for the carrying out of these experiments, and getting into contact with the farmers in a way that we could not do if we had to do it from the College. As the College grows and the demands on the staff are increased, it is an impossibility for these experiments to be carried out satisfactorily from the central institution, and I think that there ought to be maintained by the County Council in each county a good many centres permanently, preferably near a station. They should be of a simple character—more or less exhibition plots—dealing, perhaps, more particularly with grass lands. Wherever there has been grazing or dairying carried on for a long time throughout the country the grass has become of very poor condition, and we have very

Mr. J. Percival.

4107b

4107a

Mr.
J. Percival.
15 May, 1907.

frequent enquiries on the question as to how to improve that. It is not a very difficult matter to do, and I thought if experiments could be arranged at certain centres near stations, or in localities convenient of access, it would be a very useful thing. This is what we are trying to do, particularly in Buckinghamshire, where we have a resident lecturer attached to the College, and appointed by the County Council. If there are any more details that the Committee would like to have, I should be glad to deal with them.

4108. What are the experiments that are carried out. Would you describe them to us?—At the present time, with regard to the grass land in Buckinghamshire, there have been simple manurial experiments, where the grass is treated in various ways with different types of manures. The literature with regard to these experiments has been forwarded to this Committee.

4109. You have a printed account of them?—Yes.

4110. Then that can be handed in?—Yes; the exact details you will get readily from the printed account.

4111. Your evidence is that various experiments should be conducted at a number of centres for a number of years, in order to arrive at a definite conclusion?—Yes.

4112. The experiments are paid for by the County Council of the county in which they are carried out?—Only indirectly. We pay for all the manures and practically for the superintendence.

4113. You have no difficulty in obtaining farms for the purpose of carrying out experiments?—Not the slightest.

4114. The farmers welcome these experiments?—They welcome them and they apply for more than we can really undertake. We have some difficulty in multiplying them, and it becomes a serious matter to attend to them as they ought to be attended to; but we have no difficulty in getting as much land as we want for the purpose.

4115. These experiments are explained in lectures?—Yes.

4116. The experiments conducted during the summer are explained in lectures which are given during the winter?—Yes, and mostly farmers attend; and of course when we have a number of farmers at these particular centres, we very often ask the farmers to attend and give them an explanation of an experiment on the plot itself.

4117. Are there local committees of the County Councils?—In some counties there are agricultural sub-committees of the County Council, but unfortunately we have not them in each county. There are none in Berkshire at the present moment, and as Mr. Latham has pointed out there is a difficulty there; but wherever there is an agricultural sub-committee in connection with the County Council there is real life infused in connection with the experiments, but not otherwise.

4118. Lectures are given at farmers' clubs too. I suppose?—Yes, at farmers' clubs.

4119. Have you conducted any experiments with regard to sugar-beet growing?—Yes; the County Council of Buckinghamshire gave me a special grant in connection with that matter this year. I had six centres and two different types of sugar-beet obtained from the very best sources on the Continent. Those have been grown, and the results were published a month ago.

4120. Has the result been satisfactory?—Yes, decidedly. We have found that we can grow sugar-beet quite as well as they can on the Continent, and the yield is in fact higher than those from Germany, and the quality is quite equal to that from Germany. The cost of production also is practically as low as it is on the Continent. It is easy enough to grow it here. The whole problem as to whether it is advisable to recommend farmers to take up the cultivation of sugar-beet in this country is more or less a fiscal problem. I somewhat reluctantly undertook it, because I knew pretty well from experience elsewhere what would be the result, but the County Council were anxious to have the experiments carried out. The result was, more or less, obvious. I should like to see some institution established to settle the question and deal with the problem whether it can be carried out from the practical point of view in this country. The question of sugar beet growing has

been so much in the air for the last quarter of a century that it is time something was done to settle the question whether you can manufacture sugar profitably from beet grown in this country.

4121. Have you a factory to which you could send the beet you have cultivated to make sugar out of it?—No, there does not exist such a factory in this country.

4122. Where has the testing of the sugar that has been made from the beet grown by you been done?—The sugar tests have been carried out in our own laboratories at Reading.

4123. Have you had to invest in special apparatus for that?—We have had to spend some money in carrying out the investigation, in the acquisition of certain special pieces of apparatus which we had not got in the laboratory, and which we had to buy.

4124. Quite so. Is the result you have obtained, having regard to the excise duty, one that leads you to say it would be a remunerative crop for a farmer to grow?—I do not think it would be if the excise duty of 4/2 a cwt. on refined sugar is demanded from the English grower. I do not think it would pay unless there was a rebate made. The rebate might not be so much as 4/2; I think it would pay if we got a rebate of 2/6 a cwt., which is practically what the Brussels Convention has arranged with regard to foreign countries; but unless that rebate is obtained I do not think it would be profitable.

4125. Are you of opinion that beetroot would be a suitable crop for small holdings?—Yes, I think decidedly it would—I believe perhaps better than for the large farmers—if there were a factory in the neighbourhood.

4126. There would come in then the application of the co-operative principle?—Yes.

4127. Do you give any instruction in book-keeping at the College?—Yes, that is one of the fundamental things students begin with the moment they enter the College.

4128. And estate management?—Yes.

4129. You are of opinion that the research work carried on at the College is of great value, and is much appreciated by the farmers?—Yes.

4130. You wish to give further development to research work?—Yes, certainly.

4131. The students who go in for the diploma examination also attend the lectures of the general scientific course at the college?—They do.

4132. Therefore the agricultural department and the general department are not separated; they are not watertight compartments?—No; that is the great advantage we possess, because the scientific teaching which is really the trouble, and which an agricultural department I think scarcely ought to have in hand, is done by experts in those particular pure sciences. The difficulty always is to get the science that is taught really well done in many of these colleges, and I think we have an advantage at Reading in some respects at any rate through having general scientific departments to which we can send our students in the first year at any rate, but at the same time as that is going on they must attend lectures in agriculture as far as possible in the first year and book-keeping as well as surveying and veterinary hygiene and other subjects of similar character.

4133. In that respect the Treasury grant which is used for the general purposes of the College for the scientific courses is also of use to the agricultural department indirectly?—Yes, I think so.

4134. With regard to the previous education which your students have had, have you any observations to make on that head?—Yes. I think there is a tendency for the education to be not quite that which it ought to be in order to get the very best work out of the students when they come to us. Sometimes we may have preliminary work to do with them which ought to be done in the school from which they have come, but on a large scale we do not see much of that in Reading; there is only a little of it.

4135. Is it your view that a general education is the best preparation for those students who come to you?—Certainly.

4136. You prefer that a general education should be given to your students before they come to you rather than the instruction which is given in such a school as

Basing?—Yes, I certainly think so. It would be very much better in the long run to educate them generally than to attempt to specialise before they are really capable of studying the special work.

4137. Do you consider the school at Basing is useful for boys who are obliged to leave off their schooling at a certain age—boys who cannot take up your college afterwards?—Yes.

4138. As a preparatory school for the diploma you consider it is better for them to go to a school where the education is purely general?—Yes, but there are many cases where the education is such that they would be quite capable of going on to Reading for the diploma course. Possibly however in the case of the majority of students who go to Basing with the intention of stopping at sixteen I do not think it would be any use sending them to us for diploma work. It would be a useful preparation for the short course.

4139. You think some such sort of school should be provided?—Yes, with a limitation as to the type of work they are to do. There seems to me to be a very great danger indeed of those schools attempting to do work which they cannot do satisfactorily, because of the want of staff and equipment and so on. That must obviously be the case because there are times when the number of students who would attend such a school might be rather small in number, and there would probably be a tendency to keep men there who would be better employed elsewhere.

4140. You would limit the curriculum strictly to the proper work for which such an institution was designed?—Certainly.

4141. You would prevent them from being over ambitious?—Yes, I think so. I think it is best in the interests of the farming community generally not to allow that. But I do not want to give the impression that I am against these schools in any way. It is only in the respect that I have mentioned. They are doing very good work indeed at Basing. I have had the opportunity of examining and inspecting the school for three years officially for the Hampshire County Council, and I have seen the type of student that has gone through that school during that period. They certainly do a very great deal of useful work for the type of individual that is sent there as a rule, and so long as they keep students of that type there I think it is a very useful thing indeed. If it is a question of multiplying them, I should hesitate to express an opinion as to whether it is advisable to multiply such schools all over the country; they are somewhat expensive, and it is just possible that you might get similar work done in the county at centres and at evening classes during the winter, or perhaps during the summer, if necessary, with boys of that type.

4142. More as a continuation course?—Yes.

4143. In the way of evening continuation schools?—Yes. I do not know whether it is a question of finance, but it is a matter that is well worth looking into.

4144. Then with regard to the training of elementary teachers?—Dr. Keeble who has charge more particularly of that subject will give evidence later as to that.

4145. Do you consider that the diploma which you award at the College fits a man to give agricultural instruction himself?—Yes, I think so.

4146. Some of your diploma students have become agricultural teachers?—Yes. Of course it is not that all of them would be capable of doing that. You have to consider the original history of these students to some extent, and their general bias. It is impossible to turn a student at Reading on to teaching work in all cases; some would be very much better than others through having some preliminary knowledge of farm work. Some of them I should send to a farm for two or three years after they got their diploma before there could be any idea of their taking up teaching.

4147. Have some of your degree students after leaving you gone to Cambridge?—I do not think so.

4148. You encourage them to go to London?—Yes. It is only lately that the London University have granted degrees in Agriculture, but we have a student now who is taking that.

4149. Have you any criticism to offer on the external University examination for the degree of Agriculture?—

No, I have no criticism, except that I think it is a very useful examination so far as I have seen from the syllabus.

4150. You think it is well conducted?—Yes, I think so.

4151. (*By Lord Moreton.*) I do not know whether you can answer the question that I asked Mr. Sutton, about the facilities for labourers' sons attending at Reading, or getting instruction through Reading?—We only take students, of course, at Reading, over 16 years of age; but there would be no difficulty in the labourer's son, or anyone's son, getting instruction there. There is no special course, however, arranged at Reading for labourers' sons, many of whom have been only partially educated. A great many of them would be able to get their education at evening continuation schools, or at schools such as Basing; more preferably the continuation schools.

4152. (*By Mr. Staveley-Hill.*) I should like you to explain, if you can, an answer to a question which was given by the last witness this morning. I meant to have asked him about it. He spoke of a certain number of your pupils who became gardeners—whose after-careers were found to be that of gardeners in various employment. In answer to Lord Moreton, you say you have no labourers' sons at the College—how do you quite explain that?—Of course the question of the horticultural student would be dealt with by Dr. Keeble particularly; we have no special courses for labourers' sons as labourers' sons, but there is no reason why half the students who have come to us are not labourers' sons. I do not know that they are not.

4153. That is possibly the explanation. At any rate, we will probably get it from Mr. Keeble. With regard to these local lectures on agricultural subjects, do you give them throughout the contributing counties as well as in Berkshire?—Yes. Those local lectures are chiefly of course given during the winter by members of the College staff. In some cases lecturers are appointed by the County Council who are technically on our staff, but resident in the county itself. Buckinghamshire is a case in point. My own view is that we should have, if possible, in every county a definite resident lecturer, who would be attached to the College and get all the help and advice he could from the College, and spend a certain amount of his time at the College if necessary, but be resident in the county and give lectures to farmers on the more obvious problems that come up, look after experiments, get material for analysis, and in that way come into contact with the farmers. Those lectures are continually being given in the winter; we are under contract to give a certain definite number each winter as a rule.

4154. Is it within your knowledge that these lectures are well attended?—Yes. I frequently give many of them myself. The audiences, of course, vary very much. In some places, right out in the country, in the wilds of Oxfordshire or Buckinghamshire, you may not get very many, but those who do come are really keenly interested in the work, and they continue to attend the course whatever it may be, perhaps three or four lectures. During the winter I have had lectures in Reading on market days, and I tried the experiment of having them on Wednesday evenings, at 6 o'clock, and they came, between twenty and thirty of them, from various parts of the county up and down the line.

4155. Do you have lectures or instruction given in veterinary subjects?—In the College, but not outside at present.

4156. Have you considered the advisability of giving those?—In some cases those have been given in the county, not altogether under our auspices, sometimes by the County Council.

4157. In the event of your obtaining what apparently every college wishes to obtain, an increased grant, would you think it worth while to devote some part of that grant to encouraging and increasing these lectures on veterinary work?—Yes, I think so. I think that is one of the weakest parts of the agricultural teaching in the country.

4158. (*By Lord Moreton.*) What part of the county of Oxfordshire do you cover—you talked about the wilds of Oxfordshire?—A list of the centres at which we are supposed to give lectures is handed in to us by the Oxfordshire Secretary, and we go there. What information he has for obtaining the centres I do not quite understand, but certainly any centre applying

Mr.
J. Percival.
15 May 1907.

Mr. J. Percival. for lectures on agricultural subjects would get them; which is a question of local interest.

15 May, 1907. 4159. You are speaking of the future now, are not you?—No, of the past. In some places they have had lectures regularly for six or seven years, and in other places they have had none, because they do not apply for them.

4160. What part do you particularly refer to?—Principally in the north, and in the district of Thame, on the Buckinghamshire border, and north of that.

4161. (*By Mr. Davies.*) I notice that in your staff you have several professors who teach chemistry. Do your agricultural students attend the chemistry classes of the College as well?—Yes; the first year is devoted almost entirely to the purely chemical side of the teaching, and they go into the chemical department specially for that, and subsequently they are taken in hand by the specialist in agricultural chemistry.

4162. Do your short-course students attend the chemistry department lectures too?—Yes, they attend both; we have a special course for those men, a blended course.

4163. They are able to appreciate the instruction they get in chemistry?—Yes. We attempt to give them no chemistry that is not of immediate use to them in the short courses. It is quite useless to spend much time on pure science in those cases, but you can give them a good deal of instruction on definite points in connection with manures and so on, and that is not a difficult matter to arrange.

4164. You are able to make use for that purpose of the equipment provided at the College?—Yes.

4165. Do you make any attempt to teach any kind of agricultural history in your department?—No, we have not done so, except as incidentally in the case of all lectures; I think it is best to begin with a sort of historical account of things—but we have no lectures specially dealing with the history of agriculture.

4166. Do you think it would be desirable in the course of agricultural instruction to devote some attention to that phase of the subject?—I think so, if there was time for it. It is a matter that has been of very great interest to me for many years, the study of the literature on the subject right back to the sixteenth century and from that date onwards, but it is very difficult to find the time for it with the ordinary students. I should think, however, it would be an excellent plan, especially with the students who are taking the higher courses.

4167. With regard to the experiments and demonstrations that you carry on in the counties, do you think it is desirable—or have you any views with regard to the co-ordination of the different experiments carried on all over the country by the various colleges?—Yes, I think it would be a very useful thing to have certain similar types of experiment carried out all over Great Britain. There have been a large number of different kinds of experiments, some only slightly different from each other, carried out in the past, that scarcely any conclusions are to be deduced from them. I think the Board of Agriculture does suggest a scheme for experimenting on those lines, but I am not sure that it has been taken up very extensively, possibly because the experiments have not been understood altogether, and the extent of the work demanded by that scheme is, I think, in many cases too large. But it would be an excellent plan to have some definite types of experiment carried out, say over one thousand farms in Great Britain. If that were once done for three years—that would be quite long enough—we should then be able to record the results and to put away on one side those results as trustworthy, and as evidence that is worth having. There has been hitherto such a lot of moving the experiments about, that very little real good has come of it. That is a thing that should be arranged by the Board of Agriculture, and possibly the County Councils themselves, maintaining definite centres and refusing to allow a farmer to have an experiment on his land unless he will guarantee to keep it going there for three years. That is what I have been doing in Buckinghamshire. There are plenty of people who want to carry on experiments and I make it a condition that if an experiment is to be commenced on a person's land, I am to have the use of it for three years to allow that experiment to be brought to a definite conclusion, and I have no difficulty in getting it.

4168. Would you think it desirable that the Board of Agriculture should appoint a consultative committee with representatives on it from different parts of the country?—I think it would be a very useful thing.

4169. One witness told the Committee that he thought all these demonstrations should be of a migratory character, because difficulties were created in the different localities if these demonstrations were all carried on in one place, and were not migratory?—Yes, it is necessary that they should be migratory, but I would not have only one experiment; I should have perhaps 50 in one county. Superintendence is the difficulty, but I should never think of having only one experiment in one locality, and then raising that and going to another locality and showing them the result of that experiment. You ought to have the same experiment multiplied in 50 different places simultaneously, and not have only one experiment carried about to different parts of the country.

4170. Would you like to see it carried out on the principle that is adopted in America of sending out a paper to all the farmers asking them to state the results of their experiments, and so gathering the general results of the whole?—Yes, that would be a very excellent plan. The more definite in type the experiments are and the more we can get of the same type, the more useful and permanent the conclusions would be. Further, I would not limit the type; I should have them on the results of the use of the different manures, the testing of potatoes, and so on, all over the country.

4171. Have you any institution for keeping in touch with your old students?—Yes, we have an Old Students' Association of the College, and they meet once a year.

4172. You have no special organisation of that kind for the Agricultural Department?—Not for the agricultural department alone, but that might possibly be developed.

4173. I do not quite know what your relationship is with the School at Basing. Do you act in the capacity of advisers in any way of the staff there, or have you any sort of control over them?—I am personally on the Advisory Education Committee of the Hampshire County Council, and we examine the school officially—we spend two or three days there. Practical dairying and farming, and all the curriculum is carefully gone through.

4174. You do not carry out experiments there?—No, not there, they carry out their own. But they get advice and suggestions from us—for instance, yesterday I had the manager of the Farm School at Basing down to talk over a scheme of experiments which they are beginning there.

4175. You would like to get into closer touch with Basing?—Yes, I think so, and Hampshire generally.

4176. (*By Mr. Latham.*) To go back to the lectures, what centres in Berkshire have you taken during the winter?—They have only been as a matter of fact in Reading, since I have been there.

4177. I think you have a syllabus for those lectures?—We have, but I have not a copy here.

4178. I dare say you can recollect the subjects?—Yes. I find it is very much better to give lectures on defined specific subjects rather than to attempt to deal with a course. A farmer will come and listen to a lecture, say, on linseed cake, or on nitrate of soda, and how to use it, much more readily than he will attend the course of lectures on manures generally. He does not want to learn a great deal all at once, and I find it is much better to give them lectures on some definite subject. The lectures that I gave at Reading on the market days were, one on basic slag, on the use of it, what it was made of, its cost and so on, how to buy it sensibly, and another on the growth of malting barley, and the use of lime, and I think the use of some other manure, and the milk standard and so on.

4179. Those different lectures were advertised and the farmers all knew what they were going to listen to before they went to them?—Yes.

4180. Do you not think a great mistake has been made in the past very often because a farmer has come to listen to a lecture, and when he has got to it, he has found that he could not understand it at all?—Yes, that has been the great mistake that has been made.

4181. Is it the wish of the College—I will not say the County Councils—to continue these lectures in the

outside towns on market days?—Yes, I should like to do that certainly, but it is more a question of getting time for it as far as we are concerned. I think in Berkshire, we could probably do it and also at several other centres, but as the work of the College grows it becomes difficult to attend to the county wants in many cases. That is why I strongly recommend that an appointment should be made of some member of the staff to be set aside to go about the county, to come in contact with the farmers, and let them know what is going on. It cannot be done really satisfactorily from any permanent central institution; you must have a travelling lecturer connected with the central institution and resident in the area, and then you would get a great awakening in scientific education and general agricultural training.

4182. He should be a member of your staff, and you should be responsible for the sort of lectures he gives?—Yes.

4183. You have had a good deal to do with Wye College, have you not?—Yes.

4184. So that naturally what Mr. Hall and Professor Dunstan have said here, you would re-echo to a certain extent?—Yes.

4185. You have lately taken a new farm at Reading, have you not?—Yes, about 150 acres.

4186. That does deal with horticulture?—No.

4187. What is about the quantity of the cows you have?—We have about a dozen, I think, now.

4188. I suppose it is fair for me to put in evidence these most excellent milk-test cards that I get sent to me every week?—Yes, I think so; they are quite independent of us.

4189. You consider from your point of view, which means from the point of view of your own farm, and also from the point of view of the quality of the milk that has been supplied to the Institute, that enormous strides have been made through suggestions and help, and so on, that have been given from your Institution?—I think it is likely.

4190. I think you ought to admit that. Before your educational help went to the persons who sent the milk in, it was of bad quality, and through your suggestions—I do not mind taking a little of the credit to myself—it has been very much improved?—Yes, very much.

4191. That would be an excellent subject for a lecture would it not?—Certainly.

4192. That is the kind of subject that would probably bring the farmers together more than perhaps some of the higher scientific lectures?—Yes.

4193. That is what I want you to show this Committee, that the milk standard is a sore thing with some of the farmers, and that there would be little or no difficulty in getting the milk standard up?—No, there would be no difficulty in getting the standard up.

4194. You spoke of sugar beet growing on small holdings. Do you think that might be made profitable to a man with a small holding?—I am afraid I must decline to discuss the profitable side of it. As I have pointed out, it is a question of fiscal policy as to the profit that you would get out of it in this country. It is quite clear, however, that we can grow sugar beet as good in quality and quantity as any sugar beet growing country in the world and also as cheaply. The question whether it will pay or not does not depend on whether we can grow it; it depends on the duties for revenue purposes. At the present time there is a duty of 4s. 2d. a cwt. on refined sugar coming into this country, simply for revenue purposes, and if a rebate in the duty on refined sugar were made in the country generally for the purpose of enabling the English farmer who attempted to grow sugar beet to make a profit, the revenue authorities would immediately want to know how to make up the deficit that would thereby ensue.

4195. I should like to know, for instance, whether Mr. Sutton would make more out of his mangels, or more out of his sugar beet?—He would probably make more out of his mangels, but that does not apply to the question whether we can grow sugar beet in this country.

4196. You said just now that sugar beet growing was particularly applicable to small holdings?—Yes.

4197. A man with a small holding could not possibly

grow enough to make it profitable?—That is a matter of opinion, of course.

4198. To go back to the teaching of these young men in the evening classes, do you think you are likely to get the young men to give up their evenings for any continued length of time?—We have found that they certainly do give up their evenings.

4199. That is purely local. They will not come for eight or ten miles to attend evening classes?—That may be so, but locally we can get quite enough to make it a very valuable work.

4200. In order to touch the different localities, you would want classes to be held at the various local centres?—Yes, that could be done by holding lectures in the different centres.

4201. Not lectures, evening classes, and I do not see how you could get attendance at evening classes at every centre in the county?—I do not anticipate that. I think we have got as much as we can do at Reading, and that is a valuable work, and that satisfies us.

4202. But that means that certain localities have to be neglected?—Certainly, it would mean that probably.

4203. Do you not think there ought to be scholarships offered in every county?—Certainly, I think there ought to be scholarships in every county, and it is the want of those scholarships that explains a good deal with regard to the cutting down of the number of the short-course students.

4204. I have not heard any questions asked, and I do not think you have given us any information with regard to the fees charged at the college for agriculture?—You will find those in the calendar.

4205. Would you mind telling me where?—The agricultural fees you will find on page 68 of the calendar, and in the prospectus at page 10. You will see the exact details are given there with regard to the fees that are payable by each student for the Diploma in Agriculture and Dairying, and the Certificates in Dairying and Agriculture, and also the reduced fees for those students who come from the counties whose Councils contribute to the Agricultural Fund of the College.

4206. Of course those are without residence?—Yes. The reduced fees for the Diploma in Agriculture is £13 10s. for two terms, in Dairying £12; and for the Certificate in Agriculture, £9; and in Dairying, £17 for two terms.

4207. What would be a fair scholarship to grant, to include maintenance?—I should think possibly £30, it would amount to as much as that.

4208. If it is possible to get, say, half-a-dozen scholarships out of the counties, a £30 scholarship would be sufficient. I am only speaking of the teaching—not of the residence, of course?—I should say £20 for the teaching and £30 for the residence.

4209. So that to cover it all it would be £50?—Yes.

4210. I asked you just now with regard to the winter course. Do you not think if you had two courses, a winter course and a summer course combined, it would have a very much greater effect on the education?—I think a summer course would be valuable, but it is exceedingly difficult to get a student to attend in the summer, because he is generally very useful to his father on the farm at that time. That is the sort of student who would not be likely to use the summer course, but of course we have a good many who come for the whole year mainly for the diploma work, and I think that course is the better of the two.

4211. If he is let away from one winter course to the other, I should have thought that his free hand in the interval would operate against his coming back for the next winter course?—I do not think that applies, because we have had men who have come back for the next winter course frequently.

4212. Would you recommend that the difference in the soils in different localities, and in the atmosphere, and so on, should be registered by means of demonstrations, and that sort of thing?—Yes, certainly.

4213. Should it be laid down by the Board of Agriculture what line those demonstrations should take?—I think by the Board of Agriculture in consultation with individuals in the different localities.

4214. If they are to be of any use they must all be exactly on the same subject?—Yes, certainly.

4215. Do you think that large farmers and landowners

Mr.
J. Percival.
15 May, 1907.

Mr.
J. Percival.
15 May, 1907.

are getting more anxious to send their sons to colleges? —I think so, certainly.

4216. Can you demonstrate in what way?—We have got more students, as a matter of fact, at Reading than we had of that type coming from that sort of home.

4217. For what length of time do they stop with you? —Two years, the Diploma student. Those are the individuals we are wanting to encourage more particularly, as well as the short-course students.

4218. They stop with you during the whole time?—Yes, except of course during the vacations. We then recommend them to go back, either to their own farm or to some farm, rather than do nothing, or even be at Reading itself. There are three terms consisting of 10 weeks each, and then there are the vacations; and I should strongly recommend them to go on to a farm immediately, somewhere else, rather than at Reading.

4219. Among the demonstrations that you have taken up at your farm, are there demonstrations showing the nature of the soils, and the damage the several manures will do to the soils?—Yes, we are trying to do that.

4220. They create a large amount of interest?—Oh, yes.

4221. Do you show in these lectures experiments on growing crops with certain manures?—Yes, we always have illustrations.

4222. Do you think the lad of sixteen years can be induced to come to you after he has left his ordinary education?—Yes, he does certainly.

4223. To what extent?—As I said, we have more than we had previously; within the last two or three years we have had more of that class of student.

4224. Are they for the short course or the long course?—For the long course.

4225. It is the short course I want to know about?—In the short course there are not so many as there were formerly, and that I think is accounted for by the fact, mainly, that the County Councils have stopped scholarships covering those.

4226. Do you give any lectures in live stock valuing, buying and selling?—Yes, that is given by the agricultural lecturers, Mr. Evans and Mr. Atkinson.

4227. It is scarcely necessary for me to ask the question whether they are competent to give those?—Yes, I think they are—they would not be there if they were not.

4228. Quite so. Your work has been enormously increased lately from the laboratory side?—Yes. I am going to deal with that afterwards, if I may.

4229. I should like you, if you will, to say a few words on that now?—The question of the use of the laboratories of the College as a place for giving scientific instruction on various points I was going to deal with. I think you have the figure there of the results of the scientific experiments that have been carried out during the last three years. On sheet H you have a statement showing the analytical work which has been done in connection with the agricultural department with regard to over 700 samples of various kinds of material that came from farmers, and which have been investigated and reported on during that time. That is a kind of work which I think is of the utmost importance, perhaps as important as any at the present time for enlisting the interest of the farmer. I have felt that in order to get the interest of the farmer as he exists at the present time—the man who is actually farming—you must go to him with something that has a pecuniary value, and this is of real definite use to him. The question whether a feeding stuff is really worth what is asked for it, what its nature is, whether his milk is right or wrong, whether he is likely to get fined or not, the question of whether his manures are adapted for the purposes for which he has got them, whether they

are worth what is being charged for them, are all matters of immediate practical interest, and that is work that has grown very much indeed since we have had an analyst to do nothing else but that type of work. He has got as much as he can get through—independently of course of enquiries dealing with pests and other things which would naturally go in to the same list, although they are not included in this total. These come from farmers in various parts of the neighbouring counties; they are sent in by post or sometimes the farmers bring them themselves into the laboratories and have a talk about them. We are always ready to meet them, and we are always in the market on the mornings of the market day and have a talk with them there. That side of the work is doing almost more than anything else to secure the interest of the farmers throughout the county; it is work of which he can see the value of at once the moment he can talk the matter over. We do not allow the farmers to use any certificate or report which we give for legal purposes; they are simply given for the farmer's own private information. Any matter that we consider is worth his while taking up from the legal point of view we should at once hand on to the proper analyst of the county, the public analyst who deals with the Food and Drugs Act and the Fertilisers Act.

4230. Supposing you were given a considerably larger grant through the Board of Agriculture, in what direction would you principally develop your work?—There are a great many points that want developing I think—the analytical side, the various researches, and the staff. In many cases we want experts for particular subjects. I could not lay my fingers on definite things that we want money for more than others, but I should say we should be able to apply it to a great many things that are simply left at the present time for want of funds—analyses of soils in the county, and so on.

4231. I think you mentioned that experiments on grass lands were sadly neglected?—Yes, that is so, and that is a matter I think which brings its return almost immediately. Grass land in many cases is in such a very bad state that anything like a couple of years experimenting convinces a farmer that he can improve his method in nearly all cases, but those experiments want carrying out permanently for a number of years and on a very large scale so far as numbers are concerned.

4232. It would be of value also in showing that the new system of dairying was not doing the land a vast amount of harm?—Yes. Of course all experiments involving analyses of the soil and so on are expensive, and we want special grants for it. As a matter of fact we have had special grants from some of the county councils for that kind of work. For instance the Buckinghamshire County Council have been giving us a little at a time—they have just given us £20 for some experiments they wanted carrying out, and I should like to see 50 or a 100 similar experiments being carried out at the same time, and at the end of the time we should have something definite.

4233. Experiments on grass lands is one class of experiment that you would like to see carried out?—Yes, that is one of the most important class of experiments, and that would yield immediate and useful returns.

4234. That is one that could not be carried out except by scientific men?—That is so.

4235. It ought to be carried out on scientific lines?—Yes.

4236. You and I have had some conversation with regard to the milk certificate that we had from the dairy before you began the improvements, and I want to ask you whether you are willing to produce the bad certificates with the improved certificates so that we may have an opportunity of comparing them?—I do not think there is any objection to that, and I will see what I can do with regard to it.

Mr. FREDERICK W. KEEBLE, M.A., D.Sc., called and examined.

Dr
F. W. Keeble.

4237. (By the Chairman.) You are Director of the Horticultural Department of the University College, Reading?—Yes.

4238. You are prepared to give the Committee some

information as to the provision for the training of teachers in agricultural or rural subjects and information on horticultural education generally?—Yes. I should like to divide the subjects on which I am prepared

to give evidence into two parts, one on horticultural education, and the other on the provision for the training of teachers in agricultural or rural subjects. It is a matter of indifference to me which of those two sections I take first, if it is a matter of indifference to you?

4239. Quite.—If I may deal first with horticultural education, the principal contribution that I have to make is that until the foundation at Reading of a horticultural department as a definite department, there was, as far as I am aware, absolutely no provision at all in this country for horticultural education for men. The Committee are aware of the existence of several important horticultural colleges for women, such as Swanley and others, but for men there was no provision. The course of study which has been adopted has been outlined, and I need only refer to the salient fact that in order to gain our diploma the student has to attend a two years' course. To that I should like to add, that in almost all cases we are successful in persuading our students to put in a third year, either with us or with some grower or market gardener or nurseryman, before embarking upon his own particular career. You have heard the statistics relating to the posts occupied by our students. Those statistics, it appears to me, indicate that our department is fulfilling a useful part in horticultural education. At the same time I should like to take this opportunity to say that although the horticultural department at Reading may regard itself as being somewhat efficient in regard to its particular work, that of training men for horticultural occupations, it falls, as I think all institutions with similar objects in agriculture do, far short of the national requirements. I feel very strongly that such an institution as ours, and if I were competent to express an opinion I should be inclined to include all other institutions of a similar kind, is only doing at present about half the work which should be required of it. The idea which I wish to put before the Committee is this: That the staff spends its time in teaching and its spare time in research, and we ought to have in addition to that another staff which spends its time in research and its spare time in teaching. Until that is done, it seems to me we cannot claim to have fulfilled our object.

4240. You want part of the staff to be entirely devoted to research?—Not entirely, but mainly devoted to research. I would never completely separate teaching and research.

4241. You would allow them plenty of time for research?—Yes, at present none of the teachers have any serious time for research except possibly at Cambridge. That is a question of finance, perhaps, and therefore one that falls outside my province. Reverting to the experiments in teaching which we have adopted, besides the Diploma course which you have heard of, and the Certificate course which has been mentioned, we also founded some years ago a series of scholarships in the hope of attracting ability from among the gardening class. We offered scholarships of £40 a year to *bona fide* gardeners to come to the college and study under certain conditions. We were sanguine about it and we continued those scholarships for some years, but at last on my own recommendation they were suspended, the reason for that recommendation being that we had failed altogether to attract that ability which we had hoped to get. We had a fair number of applicants, but the general level of intelligence of the applicants was low, and that I think ought to be linked up with another fact that the general level of trained intelligence of the students that we get is not as high as one might expect at this time of educational endeavour. The criticism which one would be inclined to suggest is that the school curriculum has spread itself over a large number of subjects, and at present students come to us untrained as thinkers. That seems not to be peculiar to Reading, but as far as I am aware it is general, and it may be due to the multiplicity of subjects which are taught.

4242. You apply that generally?—Yes. I have experience in other departments besides the horticultural department, and from my general experience I find that it is universal at Reading and at Cambridge, and at other places where I have had experience.

4243. Do you attribute that to the course of education that is adopted at the secondary schools?—I attribute it to the fact that instead of a few subjects being taken as a means of training in schools, education consists largely now of a great number of subjects which are used as a means of giving information. The mind

consequently is not trained: there is not time in which to train it.

4244. You apply that also to the gardeners?—I apply that to our horticultural students. I apply it to all our students of whom I have had experience. They are not so well trained as we should have hoped them to be considering the renaissance there has been in education.

4245. Can you tell us what has been the result of the suspension of scholarships?—A number of young working gardeners go to evening classes. We have had a class which has extended over two sessions. Reference has been made to it already, and it was one of the most instructive classes we have ever been concerned in. It was conducted partly by myself, and partly by Mr. Percival, and we had an attendance of between 40 and 50 working gardeners, who came once a week for 40 weeks in the session, that is to say, 80 weeks altogether, and spent two or three hours or more in the study of subjects bearing on horticulture. They came both from Reading and for ten miles round from the surrounding counties.

4246. How many times did they attend?—For eighty weeks.

4247. After that did you give them any certificate?—No. I discouraged that. Sometimes they write to say they are entering into employment, and they would like something to show their employers what they have done, and in that case we write and give them a record.

4248. You award Diplomas, do you not?—Yes.

4249. From what class do those students come?—It varies from people whose object is to cultivate their own gardens in a strictly amateur way; from people connected with the trade through nurseries and the like; people whose object it is to embark on fruit farming at home or abroad, and who can lay their hands on a small amount of capital, down to people that come, but whom we do not encourage more than we can help, with the object of being working gardeners.

4250. Those you do not encourage?—We do not encourage them because we do not think it wise to encourage people to spend £50 or £70, whatever it may be, in order to enter a profession where they may only earn about the same amount per annum.

4251. All of your students are paying students?—All of them are paying students now. Since we have suspended the scholarships for student gardeners there have been no scholarships.

4252. What is the fee for the session of forty weeks in horticulture?—£18 for the students from the County Borough of Reading, and from the Counties of Berks, Bucks, Dorset and Oxford, and for students out of any of those counties, £24. That includes practical work in the gardens and on the fruit farms, where there is scientific instruction given, but not for instruction in bee keeping.

4253. Those who come from the counties you have mentioned pay a lower fee than those who come from outside?—Yes, in the ratio of £18 to £24. That completes the evidence on the first section of horticultural education. Shall I continue with the second section?

4254. If you please.—The second section is with regard to the provision for the training of teachers in agriculture or rural subjects. This falls into two heads—the training of teachers who are already engaged in rural schools; and, secondly, teachers in training, that is, students at the College who are undergoing preparation intending to become teachers. The essential part of the matter is the training of students who are intending to become teachers, because in the former case the training of teachers who are already engaged in teaching is an impossibility. One can put them a little more in the way of fulfilling their work in rural schools, but one cannot train them in the sense of the word; their time is past. What we have done in that respect, and what we continued to do until the funds were diverted for more pressing needs of education, has already been described. We had a Saturday afternoon class, which, in fact, still continues, although the number attending it becomes fewer. The Saturday afternoon class for teachers comprises fruit growing and the cultivation of vegetables. In addition to that we had, while it lasted, a very successful nature study course of two weeks in the summer holidays, to which people came chiefly from Buckinghamshire. We used that as a means of getting in touch with a large number of

teachers, principally in isolated places, and we helped them in the natural history part of their work. That was relinquished with the greatest reluctance on my part, and for the reason that has already been given, that money was required for other purposes.

4255. Now as regards the teachers in training?—As regards the training of students who are about to become teachers in rural elementary schools the state of affairs appears to be this—that there is no training, and that there is no possibility of there being any training in the immediate future. The Board of Education syllabus is a syllabus which was drawn up apparently by urban people for urban conditions. It has no reference to rural conditions, or even suburban conditions, and our experience with respect to the Board of Education is that it is difficult to modify that somewhat rigid course which is prescribed. Some three years ago the Principal of Reading College and myself drew up a syllabus. We felt very keenly and very strongly this urban oppression, as it were, of the Board of Education syllabus, and we drew up a syllabus which we called, for want of a better name, “Rural Economy.” This syllabus was submitted in an informal manner to certain of the Board’s officers. As a result of that submission it appeared to us distinctly inopportune and distinctly inadvisable to endeavour to introduce a reform of this kind. The syllabus still exists, but the effort has stopped there. If one considers what might be done, and if one may make one or two suggestions, it appears to me that the first thing to do is to get such a syllabus, and the second thing to do is to recognise the principle of segregation with respect to teachers. I have heard to-day that it was suggested that students in training who stay a third year might take up some sort of rural economy course. I have not got the statistics with me, but I doubt if one to five per cent. of the students in training do stay a third year. So that I think we should only touch the fringe of the question by running the thing on a three-year basis. I think the next thing to do, after a syllabus was got from the Board of Education, would be to secure possibly the co-operation of the Board of Agriculture, and then to offer this syllabus as an alternative second year, and if necessary to induce teachers to accept it by offering financial help. The syllabus should be so constructed as to make those people practical with their hands, and to habituate them to the right way of looking at natural objects, so that their life in the country would be pleasant, if training can make it so, and not oppressive, as it seems to be now. If this problem is to be solved, and I regard it as one of the greatest possible problems, it can only be solved by boldly recognising that all the syllabuses of teaching up to the present have been urban in nature, and if the Board of Education has, as its deliberate policy, the training of a town race of teachers, those syllabuses would be the best syllabuses they might reasonably produce. Until some such syllabus as I suggest, or some better scheme is adopted, there will be no training for teachers in rural districts.

4256. You suggest a syllabus, but can you suggest what would be an alternative scheme? As you are aware, the curriculum for the two years is already overloaded?—Yes.

4257. Therefore, if you introduce this syllabus, I think you should also point out what should be omitted from the present curriculum?—I think I would throw the whole of the second year’s subjects overboard. I am no believer myself at all in this multiplicity of so-called subjects, because when one looks into the things, and sees what it is they learn under the guise of these names, one finds there are really very few things, and I think you want revision from a common-sense point of view, and not from a pedagogic point of view.

4258. Would you make your syllabus the principal subject of the second year’s course?—Yes, I would make it the sole subject—I do not mean horticulture, or agriculture only, I mean in this sense rural economy, which would include a great many other things than rural economy of course.

4259. You are speaking of the training of elementary teachers for rural districts?—Yes.

4260. Would you have it at training colleges, or would you invite them to come to your college?—I would have it at any college which had facilities for giving it. I would have it under no circumstances at a training college, because it could not be given there, but at any place which had an agricultural or a horticultural department, or which had a dairy and a fruit station, and poultry and bees there, I would have it whether it was at Reading or anywhere else.

4261. Would you establish a scholarship for the pupil teachers for that purpose?—Yes, I would earmark it for that purpose.

4262. (Mr. Medd.) Might I venture to suggest, my lord, that since this most important question of the differentiation of the training of the rural from the urban teacher has been raised, it would be to the advantage of the Committee if this gentleman could return on the 28th, when the whole of the Committee will be present. This is one of the most important questions, that I think the Committee, as a whole should hear his opinions.

(The Chairman.) I will consult the Committee on that in a moment. I will explain to the Committee what my views are on that subject, if you will allow me just to put one more question to the witness.

4263. Your students for the horticultural diploma course also have the use of the general courses at the college?—Yes, in the science course they attend such subjects as chemistry, botany, book-keeping, and general science.

4264. (The Chairman.) I am quite prepared to ask both Mr. Percival and Dr. Keeble to come again, if they would be good enough to attend on the 28th.

NINTH DAY.

Tuesday, 28th May, 1907.

PRESENT :

The Right Hon. Lord REAY, G.C.S.I., G.C.I.E. (*Chairman*).

The Lord BELPER.

Lord MORETON.

Mr. DAVID DAVIES, M.P.

Mr. NORMAN LAMONT, M.P.

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Professor WILLIAM SOMERVILLE, D.Sc.

Mr. A. E. BROOKE-HUNT (*Secretary*).

Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. JOHN PERCIVAL, M.A., recalled and further examined.

4265. (*By Mr. Lamont.*) I think we understood that you represent the British Dairy Institute as well as the University College at Reading?—Yes.

4266. Do I understand that no cows are kept by the Dairy Institute?—No. There is no farm at all: we supply milk from the college farm to the Dairy Institute.

4267. In addition to that they get a certain amount of milk from outside as well?—Yes.

4268. You have cows at the college farm—I think you told us the number, 14 or 15 or so, and you supply milk to the Institute?—Yes.

4269. Can you tell me whether any experiments are made as to the effect of feeding on the yield of milk or on the percentage of butter-fat contained in the milk?—We have not made any at present. We had experiments in connection with the farmer who has been supplying milk to the college some time ago dealing with the question of feeding with certain mangels and other things, and its influence on the yield of milk and on the quality, but we have none on the college farm at present. That is an experiment, however, that I hope to begin as soon as I know the capabilities of the cows.

4270. You are aware that a very wide-spread work has been done in that direction throughout Denmark?—Yes, I know the Danish work.

4271. Do you think that would be a valuable work in this country?—Yes. We want evidence of certain things. I think that the question of feeding has been settled, and that the yield can be influenced by the feeding, but I do not think it has much influence on the quality of the milk.

4272. I think quality is hereditary, having regard to the class of the cow?—Yes, the cow is the most important factor in it.

4273. I should like to know whether anything has been done, to your knowledge, in connection with the improved system of milking which is now in vogue throughout Denmark—you know to what I refer?—Yes, I know what you are referring to, but we have not attempted that. That is a matter that we can, of course, deal with later, but we have not had the farm long enough yet, and we do not quite know the capabilities of the cows. Ever since we have had the cows, we have had the weight of the milk taken, night and morning, from each cow, and it will be very interesting to see what the total yield of each will be at the end of the time, and when we know that we can begin to experiment but it is no use until we know something about the cows.

4274. As you know also, in Denmark they only use those cows for breeding from which have a good milk record behind them?—Yes. Some cows are so poor that they are scarcely worth their keep, and I am certain there is not enough attention paid to that generally in herds. The farmer only knows the milking capacity in a rough sort of

way, and if he knew more in detail what the capabilities of his cows were, he would alter his methods of the rearing and selection of his cows very much.

4275. From my own experience of what was done at Downton with regard to the rough average of the whole of the cows in the college dairy, and also from what I have seen in Denmark, where each cow has its separate register kept, it seems to me that in that field alone there is enormous scope for improvement?—There is, certainly.

4276. I should like to ask you one or two points further as to what you were saying about the cultivation of beet sugar when you were here before. You are aware that sugar-beet growing has been tried in no less than 28 counties in England, and, I think, five in Scotland, and in almost all of those the results have been as favourable, or more favourable than practically in any other part of the continent of Europe, as far as the yield and the sweetness of the beet are concerned?—Yes; that is what we found in Buckinghamshire this year.

4277. Yes, I understood that was so in your case also. I gather from you that the difficulties in the way of a large development of this industry lie rather on the fiscal side?—I think so, certainly.

4278. So far as the manufacturing is concerned, it is hardly a matter that affects the small holder; he would have probably nothing to do with that, he would merely grow the beet, and it has been proved with beet on the Continent, and cane in the tropics, that the sugar industry is an ideal one for working with small holdings?—Certainly, on the co-operative system.

4279. I suppose we may take it that, supposing a reasonable price could be paid, nothing would be more remunerative as a crop?—No, provided you get a reasonable price, but I do not think you can get a reasonable price under the fiscal conditions at the present time: I mean the duty that is paid on sugar coming into this country. If that duty were demanded from the English manufacturer, I do not see how it would pay, and the manufacturer could not possibly pay enough for the beets to cover that, at least I do not think so, and I have paid a considerable amount of attention to the exact figures and details.

4280. You would be prepared to admit also, I daresay, that one of the great obstacles in the way of the sugar beet industry paying is this, that whereas in most factories your machinery works the whole year round, and keeps in good order, in the sugar factory the machinery is standing idle for nine months in the year, and consequently it becomes worn out; the wear and tear is greater during the idle months than during the working months, and it also quickly becomes obsolete and very constantly has to be replaced?—Quite so.

4281. Supposing your fiscal objection were removed, you do think that sugar-beet growing would be a useful industry so far as this country is concerned?—I think so. I think it would be as paying an industry as most.

Mr.
J. Percival.
28 May, 1907

Mr.
J. Percival.
—
28 May, 1907.

4282. (*By Lord Moreton.*) As regards the cows on the farm, of course you have acquired them by purchase?—Yes.

4283. In future, will you be able to breed your stock?—Yes, I want to do that in some cases.

4284. You would consider a good deal could be taught and learnt, I take it, as regards the dairy stock, by seeing different modes of dairying and treatment generally?—Quite so.

4285. With regard to what Mr. Lamont was saying just now about sugar-beet, would not one of the great difficulties with regard to the growth of sugar-beet, in addition to the fact so well put by Mr. Lamont about the machinery lying idle for nine months in the year, be the fact that a sugar-beet factory is an expensive factory to start?—Yes, very.

4286. And a factory that is no use starting unless you have a considerable number of acres which you can devote to the growing of beet?—That is so.

4287. I have seen the figures?—Several thousand acres probably.

4288. As regards the suitability of sugar-beet growing for the small holder, I suppose we may consider a small holder a man farming, shall we say, not more than 50 acres?—Yes.

4289. He would only be able to grow a small quantity of sugar-beet. Would you advocate that the small holder should grow sugar-beet after sugar-beet, year after year, on the same ground?—Yes. I do not think there is any objection against it.

4290. (*By Mr. Latham.*) I simply ask you whether you wish to put in the certificates showing the extraordinary difference in the milk records since you have taken the matter up and what did happen when we first took them over?—Yes, I should be pleased to send in the exact figures for the period before we dealt with the matter, and for the period afterwards if you wish it. There has been a considerable difference in the milk. It is rather a difficult question, but the milk that was supplied to the Dairy Institute was not quite up to the standard of the agreement which we had with the farmer, and he suggested that it could not be made better. I pointed out, along with Mr. Latham, the lines on which improvement could be made, as we thought, and the farmer got the milk standard up very considerably higher than he was prepared to think he could get it, and it has maintained that high standard for over a year now. It is considerably above 3 per cent. in fat, whereas formerly it went sometimes below that, although the actual standard of the agreement was 3½ per cent. I could send some of the figures at any rate for those two periods. I think the farmer did not really know exactly how to get over the difficulty, and it was only on the lines we suggested, which were based on experiments up and down the country, and abroad, that gave him the key to a distinct improvement. First of all a good breed of cow is a necessity, of course, because that is a fundamental joint, I take it; secondly the question of milking interval must be considered; and thirdly, the milking should be done carefully and the animal properly milked rather than leaving the best milk still in the cow. The quality depends on those three things rather than on the feeding. The farmer is inclined to think that the food is the most important matter, and he constantly, when complaints are made, comes and asks me how he can feed his cows better than he is feeding them to get a better standard of milk. I tell him it has practically nothing to do with the food, but that he must look to the other things; the kind of cow he keeps, the milking interval, and the method of milking, so that it is carefully done, and not hurried; with those suggestions he has worked along, and the milk quality has been very much better since that time. He has further got over the period which it was considered impossible to get over, namely, the early spring, when the milk quality naturally falls very low. We have had no trouble during the early period of this year, and formerly we had to deduct a certain amount because of the low standard, but this year we have paid him up to the full price, and he has not let the standard go down.

4291. (*By Dr. Somerville.*) I know you have now obtained a farm for the requirements of the students. May I ask whether you intend to run this farm as a demonstration centre where object-lessons will be provided for the benefit of agriculturists generally?—Yes, we hope to do that; it is being laid out practically with that idea. On all the larger grass fields I have several types of experiments going on which are designed for the assistance of farmers who like to come; and this year, at the present

moment in fact, I am arranging eight or ten acres of ground specially for that purpose and with that object.

4292. I suppose you consider it of great importance that farmers should learn to know how to carry out simple field experiments for themselves?—Yes.

4293. I suppose it is conceivable that a farmer might take up much more land than is really necessary in order to elucidate a certain point, and it is possible by putting him on right lines that he would get at his object a great deal more quickly and conveniently than he otherwise would do?—Yes. I make a point, if a farmer comes to me for any advice with regard to manuring or altering his cropping or anything of that sort, that he shall not carry out my advice over the whole field, but that he must leave a good deal of it untreated so that he can see whether my advice is right or wrong.

4294. You are duplicating local experimental stations to a large extent throughout your area?—Yes.

4295. I think you are in favour of the statistical method, that is to say, getting hold of a large number of results, and rather striking an average?—Yes. I think that is the only way to get satisfactory conclusions. Of course the whole question of how the results are to be dealt with is an important matter. It does not do to lump them altogether without considering what the nature of each experiment is. It is not wise to deal with averages indiscriminately in some cases, but I think until we get experiments of the same kind carried out in large numbers of centres, we shall not make much headway in experimenting in this country. Conclusions one year are altered in the next, especially if we have only used one or two centres, and then, if we have a larger number of centres, there are always a certain number of exceptions among them, and those exceptions, I believe, can only be cleared up when we get the average from those which are normal. We want a great deal of new information with regard to these exceptions, and I do not see how to get at the knowledge underlying these exceptions, and how they are caused, unless we have some idea of what the normal state is, and that can only be got by more extensive experiments.

4296. The average results would be more or less what you would call general principles?—Yes, I think so.

4297. You would probably recommend that farmers must not rely too much on general principles, but must, under guidance, try experiments upon each individual holding?—Yes, we must, of course, in view of the fact that there are exceptions. General principles are very dangerous, perhaps, to recommend all round.

4298. I think you took part, did you not, in framing a scheme of joint experiments?—Yes.

4299. Which was ultimately published and circulated by the Board of Agriculture?—Yes, I had something to do with it.

4300. Have you in your district put any of those experiments into practice?—Not exactly in the order in which they have been given in that scheme. Of course the ordinary five-plot scheme, which is carried out at all the centres which I have had anything to do with it, is common to most of the experiments in that scheme, but it seems to me that those recommendations were too elaborate, and because of their extraordinary extent I do not think they have been carried out satisfactorily anywhere. In my opinion it would be very much better to settle a part of one of these experiments, or two, or perhaps three of them—experiments given in the Board of Agriculture scheme—and have that done for, say, three years, and leave the rest.

4301. That scheme was really prepared in consultation with all the workers in agricultural science in the country, and was the outcome of their deliberations, and it is rather disconcerting to find that you say it is not proceeding satisfactorily. Would you suggest that a meeting should be called for its revision?—Perhaps I had better explain exactly my view. I think, to take any one single experiment on swedes or grass land, the scheme as given in that pamphlet is far too elaborate. It touches every single thing that can arise in that experiment, and secondly you never get it carried out in its entirety, and there is no agreement, so far as I can determine throughout the country, as to what part shall be carried out.

4302. I think the scheme was divided, so to speak, into so many sub-sections, and it was always possible for a man to take up any part of it and yet be co-operating on similar lines with his co-workers in different districts?—

Mr.
J. Percival.
23 May, 1907.

I think if it could be decided which part should be carried out it would be a good thing, instead of leaving each individual to carry out what part he likes, the consequence of which is that nothing is done. The scheme as it stands is an excellent one, but there is too much to carry out all at once, and I should like to see one or two small parts of it taken up and carried out on a very big scale throughout the country, and get the colleges or centres where the experiments are carried on to agree what they will do this year, say, and what they will do next year. If it is left in an open way, it seems to me the experiments are so vague, and it is so difficult to pick and choose which bit you would like to take up, the result being that very little is being done.

4303. Would you think it possible for the Board of Agriculture to bring pressure to bear on the institutions it supports with a view of securing their co-operation in such a scheme?—Yes, something of that sort, I think, would be useful, provided you could get some agreement as to what should be taken up. If the Board of Agriculture were to decide what portion should be carried out, and then, in consultation with the various local authorities, decide upon that particular thing being done, it would be useful.

4304. Do you include in your field demonstration work chemical analyses of the soil?—Up to the present we have not done so, but we have begun to do that this year. I will have no experiments where we cannot have an actual analysis of the soil, and that is what is being done in Buckinghamshire now. We have about 20 experiments going on on grass land, and the analyses are being made now.

4305. Do you think chemical analysis of soil is much guide as to what the soil requires in the shape of manure?—Yes, in many cases we can settle from the analysis at once what the soil will need. At present in a large number of cases we have no information to say what the analysis does mean; taking the experiments in the case of potash in the soil where there is a great deal of it, and where there is very little of it, we can settle at once what the soil needs, but it is the intermediate figures that we get in the analyses of soils that do not really convey anything. We want analyses of the soil and experiments carried out on the same piece of ground for several years, and then I think we should get definite information. It is with regard to these fluctuating figures that we know nothing at the present time, but I am certainly convinced in a great many cases that the analysis of the soil leads to a rational system of manuring, but it is only in a few cases that that is so, namely, in the extreme cases, where we get a very large amount or a very small amount of the active food-constituents.

4306. I gather on the whole that you would place more value on properly controlled experiments than on the analysis of the soil?—Yes, I certainly think so. I think, however, that analysis ought to be placed first, and that it ought to be the best means for getting the knowledge of what the land wants at once, without having to wait five or six years in experimenting. That is what I am trying to get at. We ought to be able, if analysis is any use whatever, to settle in a few days what a particular soil really wants, instead of waiting several years to carry out experiments on it. We cannot, however, at present do that because, as I say, we have not had the two things working together—analysis and experiment—long enough and on a large enough scale.

4307. Have you given much consideration to the provision of education of an agricultural character for the sons of farmers who are not, perhaps, exactly the type who would want the complete education which such a college as yours provides?—Yes, our short-course system, I think, meets the needs of those students.

4308. You would have them all go to Reading—you do not think it desirable to have subordinate institutions created in different centres of the country?—I do not think they all ought to come to Reading. I think a good deal can be done in the country by county instructors at various centres during the winter among farmers' sons by short courses being carried on there and then the best of them being sent to a place like Reading for the winter course, but I do not think it would be wise to send all classes of students to a place like Reading. I should certainly advise something being done in the counties by instructors appointed by the County Councils, perhaps associated or attached to some college, where they can get advantages from the college in respect of advice and so on, but the work should be carried on to some extent in the county for that particular class of individual.

4309. You do practise a sort of system of decentralisation in Dorset?—Yes, and in Buckingham.

4310. In each centre you have a man employed locally under the control of the College?—Yes.

4311. The student only gets his instruction through peripatetic classes. There are no semi-permanent properly equipped secondary agricultural schools in those places?—In Dorset they have a sort of agricultural side to one of the schools at Beaminster, and in Buckinghamshire too the instructors have been going to secondary schools occasionally, giving instruction there, but I think that is a great mistake as a rule.

4312. To a school of the grammar school type?—Yes, I think so.

4313. Do you know the school at West Lavington?—No.

4314. Do you know the one at Basing?—Yes, I have inspected that for three years.

4315. That is a school of the secondary type. Do you think that is a type of institution that might be increased with advantage?—I think it is a very useful institution, but I believe such schools are too expensive to carry out on a large scale throughout the country, and I believe you would get work almost as much good done by lecturers working at centres during the evening.

4316. Do the students, that attend the College at Reading live in licensed lodgings?—Yes, all of them.

4317. Do a considerable number of students come in the morning by train and leave in the evening?—No, very few.

4318. You do not encourage that sort of thing?—No, it is very unsatisfactory. There are always, of course, some coming from the neighbouring villages, but it is very rarely satisfactory. They are frequently somewhat irregular in attendance, and in other ways.

4319. I should like to know your opinion officially, if possible, of the prospective development of agricultural education in Oxford. Do you regard such development as likely in any way to interfere with the efficiency of the Reading College?—In the University, do you mean?

4320. In the University.—I do not think so.

4321. You do not think the development of an agricultural department in the University of Oxford would in any way cut into the agricultural work that is being done at the University College at Reading?—I do not think so in the slightest. I should imagine the type of work in both cases would be rather different.

4322. (By Mr. Medd.) How do you account for the very small number of students in the course for the certificate in agriculture—only six?—I think I mentioned last time that the certificate in agriculture is the course that is designed for farmers' sons who come during the winter, and a great many of them came to us through scholarships given by County Councils. Those scholarships were cut off a little while ago.

4323. What scholarships have you from the counties comprised within your own area?—The Hampshire people always send us two, and Dorset sends us one or two, Buckinghamshire one or two, from Oxford we have had some, and from Berkshire occasionally, but these have diminished since the County Councils have had less money to spend on them.

4324. You do admit scholars from other counties?—Yes.

4325. You have two, I think, from Gloucestershire?—Yes.

4326. They are very satisfactory students?—Very excellent students.

4327. You have also one or two from Somersetshire?—Yes.

4328. I am going to ask you a question which does not at all reflect upon Reading; the question applies equally to every collegiate centre. I put it to you because, I believe, you are more in a position to carry out the idea that is in my head probably than any other collegiate centre. Do you consider that the expenditure of this large sum at Reading, namely £3,027, on the agricultural department is justified in view of the very small number of students that you have—only 34?—I think so, considering the other work that is being done.

4329. You think that the experimental work is of sufficient value to the country at large to entitle you to this large amount of public money?—Yes, I do, certainly.

4330. Is there anything which would prevent your

Mr.
J. Percival.
28 May, 1907.

receiving more than 34 students if you could obtain them ?
—No, certainly not.

4331. Do you think that the value and utility of Reading as a collegiate centre would be largely increased if it became the head and centre of the whole agricultural education within the area comprised in your centre ?—Yes, I think so.

4332. In other words, that Hampshire, Berkshire, Dorset, and Oxford should look definitely to you as the centre ?—Yes, I think so, certainly.

4333. And it might be possible and advisable for those counties to confer and have a scheme of agricultural education from the elementary school to the centre at Reading to cover the whole area ?—Yes, I think that would be an excellent plan.

4334. To prevent waste and duplication ?—Yes.

4335. You mentioned in reply to Professor Somerville that such an institution as Basing would be too expensive to set up in every county ?—I think so, certainly.

4336. But Basing might appropriately form the intermediate agricultural school for your area ?—Yes, probably.

4337. Probably you would agree with me that your claim as a collegiate centre upon the Board of Agriculture and upon the Government generally would be increased if you were acting as such for the whole of those counties ?—Yes.

4338. I notice that those counties, out of their "whisky money," spend no less than £6,663 upon agricultural education, and I believe that the expenditure of that sum might be turned to some profitable account if it were all systematised. Probably you would agree with me there ?—I do.

4339. I do not suggest that you should exercise control over these counties, but that you should act in an advisory capacity, and that in determining their schemes they should confer with you, and each endeavour to help the other and generally to co-operate ?—Yes, I think that would be an excellent plan.

4340. You have, to some extent, initiated a movement of the kind by your external lecturers, to whom Professor Somerville referred ?—Yes.

4341. How are those lecturers appointed ?—By the County Councils on our recommendation generally.

4342. By whom are they paid ?—By the County Councils.

4343. That illustrates exactly what I mean in an initiatory state. Do you not think that the agricultural education of the country might be put upon a more satisfactory basis if the Board of Agriculture differentiated between types of colleges and graded them, that is to say, colleges of the first grade, such as yours, and colleges or schools of a second grade, such as Basing ?—Yes, possibly it might be useful.

4344. At present there is nothing to indicate to the public wherein one institution differs from another ?—No.

4345. That is to say, what the type of its curriculum may be ?—Yes.

4346. In the Report of the Board of Agriculture I see that grants from County Councils were received amounting to £225, and here in your statement of accounts it gives £825 ?—I think the £225 refers to the Horticultural Department only.

4347. Yes. I see that is so.

4348. I notice that neither Berkshire, Buckinghamshire, Dorsetshire, Hampshire, nor Oxford make any arrangement through any agricultural institution for the training of teachers ?—I think that is so.

4349. You would be prepared, perhaps, as a centre, to make similar arrangements to those which are made at Leeds or at Wye ?—Certainly.

4350. All our witnesses have said that it is of very great value to a district when teachers can receive that instruction. In regard to pupils who come to you, they come mainly from secondary schools, I suppose ?—Yes, most of them.

4351. How are they prepared ?—Most of them have had an adequate education ; some of them not.

4352. Is their arithmetic satisfactory ?—Generally speaking it is.

4353. I have had very great complaints from a corresponding institution to yours, near where I live, that the arithmetic as a rule is most defective, even in the case of students from the very best secondary schools. You have not found it so ?—No, I do not think so ; not generally.

354. In regard to the National Diploma in Agriculture,

do your students enter for it to a large extent ?—Yes, some of them, occasionally ; there is no special recommendation given to the students to enter for it, they take it mainly on their own responsibility because the course at Reading, and I imagine at all other colleges, is not finished when the examination generally begins ; it is a question of the time of the examination.

4355. In the case of a student consulting you, would you advise him to go for the London degree or the National Diploma ? The London degree is your degree, is it not ?—Yes.

4356. Which would you advise him to go for ?—It depends on the student ; they might be totally different types of student, and probably I should recommend one to go for the National Diploma and the other for the London degree ; it is merely a question of the time they could spend upon it. The London degree would take considerably more time to obtain than the National Diploma.

4357. It has been suggested here that it might be to the advantage of agricultural education to have a consultative or advisory committee in London composed of representatives of different counties and of different agricultural societies. Do you think that would be useful to act as a channel between the public at large and the central authority ?—In respect of examinations, or teaching, or what ?

4358. Agriculture generally ?—Agricultural education ?

4359. Yes, generally ?—I think it would be.

4360. To bring, shortly, the experience of one part of the country to the service of another part of the country, and so on ?—Yes.

4361. And also to bring pressure upon the Government to obtain money or assistance for particular developments ?—Yes.

4362. At present there is no channel. You were a member of the Agricultural Education Committee, were you not ?—Yes.

4363. Of course that did useful work in its time ?—Yes.

4364. (*By the Chairman.*) With regard to the expenditure of the college, you receive in fees over £1,300 ?—The gross fees, including maintenance, are £1,353 for agriculture and £1,025 for horticulture. Deducting cost of maintenance, the net tuition fees are £1,432, of which £871 is for agriculture. These items are readily obtained from the financial statements put in.

4365. Yes.—The finance is not in my hands, of course ; the Registrar and the Principal have mainly to deal with those matters.

4366. I wish to point out that when considering the net cost, the fees must be deducted from the total expenditure ?—Yes.

4367. With regard to a scheme of experiment your evidence goes to show that you think it is most important that a scheme should not be too elaborate ?—Yes, at first.

4368. And not too ambitious ?—And not too ambitious.

4369. And that the scheme should be limited to certain definite experiments, and that those experiments should then be spread over a wide area ?—Yes, that I think is the better plan.

4370. And that the experiments should also be accompanied with a careful analysis of the soils on which they are carried out ?—Yes, that is most important.

4371. I just wanted to sum up your evidence. If such a scheme were drawn up, then you yourself would be prepared to accept the guidance of the Board of Agriculture ?—Yes, certainly.

4372. You think that would be important ?—I think so.

4373. In order to have the experiments all over the country very much on the same basis ?—Yes, uniform.

4374. In order to get comparative results ?—Yes.

4375. (*By Mr. Latham.*) You made the remark just now that since 1902 the counties were offering you less scholarships than previously. Is that so ?—I think that is the case.

4376. Speaking for my own county now, are there any scholarships offered at all ?—I am not quite sure ; I do not think there are any now in agriculture.

4377. Because I am led to suppose that they are offered?—And no one takes them up.

4378. I do not think they are very widely known. Is it the fault of the College or the County Council?—It is nothing to do with the College; that is entirely a matter in the hands of the County Council whether the scholarships are offered or not and how they are advertised.

4379. If they are offered, the amount of money is independent of the grant that is made to the college?—Yes.

4380. That would be so generally?—Yes, I think it is.

4381. (*By the Chairman.*) I think I understood you as advocating that a number of instructors should be appointed in local centres in the counties?

4382. You would consider their work would be of value if they were carefully chosen?—Yes.

4383. You think that that department might be increased?—Yes, I think so in each county, but I think it would be advisable that those instructors should be, if possible, associated with some collegiate centre in order that they might get advice and instruction, and help and assistance, which they could not possibly get if they were isolated individuals working alone. I think there would be danger probably in appointing agricultural instructors all over the country in each county if those men were free to do as they pleased; there should be some sort of co-ordination about the work throughout the country, and it would be got, I think best, probably by having these instructors associated with some definite collegiate centre near them.

4384. Again, there you would attach value to the guidance of the Board of Agriculture which, of course, would have experience throughout the country?—Yes.

Mr.
J. Percival.
28 May, 1907.

Mr. FREDERICK W. KEEBLE, M.A., D.Sc., recalled and further examined.

4385. (*By Mr. Lamont.*) Mr. Martin Sutton told us that you might be able to answer some questions I was putting to him as to the possible bearing of your horticultural course on students from the Colonies. I see it stated in your little prospectus here, on page 11, that your students may in their second year specialise in preparation for work at home or in the Colonies. I think I understood from Mr. Sutton that that so far has not been extended to the tropical Colonies?—No. We have had several students who have gone to sub-tropical Colonies, the Cape particularly, and I am told that years ago there was one who went to Jamaica, but I know nothing of him.

4386. Seeing that our tropical Colonies have as yet themselves no centres for higher agricultural education, and that there is already a great and growing demand for scientifically trained agriculturists and horticulturists at what are certainly very attractive salaries, do you think that it might be held within the province of agricultural institutions here to endeavour to supply that demand?—I think so, absolutely. Speaking for horticulture, I think it is extremely practicable; I think the training given in horticulture in this country is admirably adapted for practice in the tropics, because we do such a lot of growing under glass, which is practically an imitation of tropical conditions.

4387. Your institution, and others like it, should have in your opinion, the important function of training horticulturally-minded persons in this country for taking up horticultural posts in tropical Colonies?—Yes; and I should be delighted to do anything to further that.

4388. In looking again at your prospectus, on page 25, under the heading of Fruit Garden, or the Orchard and the Shrubbery, the subjects dealt with; and again at the top of page 29 there is a list of subjects. Those seem to me exactly what would be required in a tropical colony, and it is a course which would be of very great value especially to students from the West Indies with which I am best acquainted?—We are just beginning to get the type of students who can fill such posts—people who have had a good general training, very often graduates of Cambridge—not from Oxford much, or at all, but from Cambridge who come to do practical work, and who would make, I think, the ideal sort of men for responsible posts out there.

4389. We already have in the West Indies a few men who have been at Cambridge, who have come out to the Imperial Department of Agriculture there for the purposes of research work, and as advisers, and perhaps occasionally as inspectors; but what I desire to indicate to the Committee is that the demand which I should like to see filled is not so much for men of quite such a high class as that, but for men who could take up posts as managers of estates, perhaps rather less scientifically trained?—Yes; men whom you could class as practical men.

4390. Exactly, and particularly perhaps with regard to one of your subjects, the improvement of fruit trees by breeding. In the West Indies a great deal has been done by means of subsidies and in other ways to foster the fruit industry, particularly bananas, but I think nothing has been done to improve the nature of the wild varieties of their fruits?—Practically nothing, except in the case of Ceylon.

4391. Except Ceylon?—I feel that we could do useful work in that direction, but our Department is too poor to advertise itself. We are quite unaided by any grants

from any public bodies—I think £25 is all we get—so that we have to economise; but I feel that if we could only give publicity to our Department that we should increase at a much more rapid rate; but with our resources, that at present is not possible.

4392. Seeing that in the meantime at any rate there is no immediate prospect of our having a University College for agriculture and horticulture in the West Indies, would you be willing that scholarships gained out there should be tenable in the Horticultural and Agricultural Department of the University College, Reading?—Most certainly.

4393. Do you think it would be advisable, in view of the fact that you have difficulties in going to the expense of advertising, to put your College and its course directly in touch with Sir Daniel Morris and his Imperial Department of Agriculture for the West Indies, which, as you know, has its own literature, and its own fortnightly Agricultural News in which they could call attention to your work, and in that way a certain publicity might be given to your course which at present it misses almost entirely so far as that part of your Department is concerned?—Certainly.

4394. If it were widely known in the West Indies and other tropical Colonies that your course was available to such students as I have indicated, and that scholarships would be tenable there, a very considerable number of students indeed would be only too glad to avail themselves of that course, I am sure?—Yes; and I think it would be not only doing a valuable service to the West Indies but a very valuable service at home as well, because there are so many men of trained intelligence who fail to get themselves niched on to something practical and who drift into the scholastic and other professions who would otherwise be doing valuable work of a practical kind.

4395. It would be opening up a new field both at home and abroad?—Yes. I think that branch is developing; it has got away from the trough of ten years ago. I mean people are willing now to work with their hands for example.

4396. (*By Mr. Medd.*) You have a very large fruit station, have you not?—Yes, 11 acres.

4397. How did you acquire that?—As head of the Horticultural Department I represented to the College that it was very important to have a fruit station in connection with horticulture, and so the Council consented to give us a piece of land at Shinfield, of 11 acres.

4398. How do you dispose of the produce?—We sell it locally.

4399. You have no difficulty in finding a market?—No—I think we could sell ten times as much.

4400. Do you give any instructions in packing and grading for market?—We do. I do not think we do it quite on the lines that we profess to do it in our syllabus, because practice has shown that it will not work quite like that. Any student who is going to be a grower or who is going to engage in professional horticulture cannot start after only a two years' course with us, and so either he has to come back to us for a year, when he gets training in all the practical things—he gets made a sort of foreman of the fruit station for example and has responsibility—or he has to go to some commercial firm, so that if he stays a third year with us he does get a good training in those things.

4401. You have some lady gardeners?—We have. The

Dr.
F. W. Keeble.

Dr.
F. W. Keeble.
28 May, 1907.

numbers of men and women used to be about equal, but now there are more men.

4402. What openings are there for ladies who have been with you?—We do not encourage people to come who are going to be gardeners, either ladies or men. The women who come to us for training belong to several categories. In the first place, ladies who are going to run their own gardens, people who live in the country and have a fair estate; and then there are some who already have in view occupations—for example, we supplied a seed testing institution with an expert, and one or two others of that sort, and then there are some who intended to start and have started as market gardeners for themselves, and who have succeeded. There are four women I can think of off-hand who started in pairs, making a very fair income.

4403. Sufficient to support themselves?—Yes. Of course, they had a little capital to begin with; they have not dilapidated their capital.

4404. It does offer remunerative occupation to a trained woman?—Yes, to a trained woman with brains. I think intelligence is indispensable.

4405. Quite so; trained and intelligent?—Yes. One of these people you might like to hear more of. She is an extremely intelligent woman who has had a good deal to do with agricultural work.

4406. She was with you for two years, was she not?—She was with us for two years.

4407. What size of garden has she now?—She had several acres, but now she has gone to a bigger one, I forget the size exactly. She does general utility work, poultry and bees, and that kind of thing.

4408. Have you any idea of the capital she started with?—I should think it was under £1,000.

4409. She does not depend upon taking pupils, does she?—No, she does not have any pupils.

4410. A *bona-fide* market-gardener and poultry-keeper?—Yes, and she goes in for flower work too; she has added on a speciality for flowers.

4411. Do you think she would be prepared to give evidence here? What part of England is she in?—In Hampshire. I should strongly urge that she should be asked to come here and give evidence, because she is a woman of very great intelligence, and could, I think, give information on that particular point.*

4412. What are the most important horticultural experiments that you are engaged in now?—As I explained to the Committee the other day, the term "experiment" seems to be used in various different ways; there are, first of all, these demonstrations by which you endeavour to give publicity to known or to partially known facts. Those really come under the head of "demonstrations"; our demonstrations are simply illustrations of such known facts as have their ordinary part in the usual teaching curriculum.

4413. Not research?—No. I am differentiating the one from the other. I should not call that research at all, simply demonstration. In our ordinary classes we have the influences of manures and experiments made in the breeding of plants to illustrate the recently discovered so-called Mendelian laws, and in addition to that, apart from our teaching work, the staff—when I say the staff I refer principally to myself—is engaged in its spare time in research, and during the years that I have been Director I have carried on experiments on the diseases of the potato and on the breeding of certain plants of horticultural importance, but the time available for research work in any institution of our kind in England is practically nil.

4414. Do the gardeners of the district consult you at all?—Yes; we have very frequent consultations with them. Our relations with the gardeners in the district are now very happy. In the first year or two we were regarded with suspicion, but we are now regarded with friendliness; in fact, the gardeners of the district appoint one governor of the College. I think that illustrates the relationship.

4415. Quite. Do you ever do any potato spraying for them?—No, we have never done any; we cannot afford a big sprayer, but, of course, we do our own.

4416. Have you come across any signs of the American gooseberry mildew?—Not in Berkshire.

4417. Is any investigation being carried on with regard to that in Berkshire?—No, I do not think so.

4418. They found the pest in Worcester?—Yes.

4419. And they talk of having an enquiry in Gloucestershire?—Yes, but, of course, we have not got anybody to

do useful work of that kind: again, finance cripples us completely.

4420. To take a case of this kind, do the gardeners anywhere in Berkshire, for instance, when they are perplexed with regard to any disease, ever come to you and ask you to advise them?—Well, they bring it in under their coats, so to speak, rather shamefacedly. The difficulty is that few gardeners will ever admit that there is anything wrong with what they have grown. Cases of apple canker are constantly coming in, and chrysanthemum rust, and so on.

4421. To go back to the fruit station for one moment; have you any idea of its cost?—I do not know what the purchase price was; it was about one-tenth of £1,600 or £2,000. The cost of maintenance I can tell you more accurately.

4422. I was going to ask you; does the profit on that fruit station defray the cost of maintaining it?—Certainly. The profit on that fruit station even now—it has only been planted for a year or so—more than defrays the cost of maintaining it.

4423. I mean "it" as distinct from the whole of the horticultural department?—Yes. Of course, we have grown crops of potatoes this year, for example, and other crops of early-grown vegetables and so forth, and they have certainly paid more than the cost of maintaining it.

4424. You are providing ground now for the National Sweet Pea Society, are you not?—Yes. I think this is the second year or the third year. They send all their new varieties to us to be tested, and on the result of those tests the certificates of the Society are awarded.

4425. With regard to the men students, do they have any difficulty in earning a living afterwards?—None but the very stupid. Of course, we have a certain number of people who are broken down in health—I am dealing with the least numerous and the least desirable class—and who have failed in various other occupations, and who come as a last hope to us. Naturally, we cannot very well refuse to have them, but they do not do any good after being with us. With regard to the other class, however, I have had more applications for posts, both for men and for women, than we can fill.

4426. That is very satisfactory.—I do not think we have a single student now, and we have had about a hundred all told, who is wanting a situation.

4427. Would they go as instructors or gardeners?—We have steadily discouraged training teachers. We have not got anybody who is teaching.

4428. Not lecturing?—No, I do not think we have got a single one.

4429. (By Mr. Latham.) May I ask what class of men and women you have as students?—They vary enormously—all classes.

4430. Do any students from the fruit-growing districts come to you?—No. We have not had a single student from Evesham, for example.

4431. Have you ever given any lectures in those centres?—As I mentioned before, Oxford is the only county which gives us a grant. That is a grant of £25, and for that some £40 worth of lectures had to be given in the county; we did a certain amount of going about in Oxfordshire in villages lecturing, giving single lectures or couples of lectures, and then in addition to that Mr. Foster, who is the instructor in practical horticulture, goes about a good deal to gardeners' associations. There is a very powerful one in Reading, and that is affiliated with a number of others and we both of us lecture to those associations now and again.

4432. Your efforts are sadly crippled for want of funds?—Yes, except from the point of view of the bare teaching.—In the way of discovering anything by way of research there is neither time nor money.

4433. If your funds were larger you could do larger work?—Yes, with, say, another £2,000 a year one could do a very great deal—things one could guarantee we could get done, and which want to be done.

4434. In answer to Mr. Medd you said your teaching in packing and grading is rather different from what it says in the book. What is your teaching in regard to that?—I think in this little book we undertake to make it a part of our two years' course, but in point of fact we do very little in the training of detailed packing and so forth in that two years' course. We find there is too much of the elementary basic sort of stuff to be learnt, and we leave

* The lady referred to subsequently gave evidence (see p. 355).

the other to a third year; and of course, if students do not stay a third year, they do not learn it.

4435. Do you know anything of Swanley?—Only by repute.

4436. Do you know that there they teach grading and packing and all the different things?—Of course the students see it done every day at our college, because we have to do the work, but they do not learn the detail.

4437. You say your students see it done, but at Swanley they actually do it themselves?—Yes, but I do not believe in their doing that until they have learnt the more important things—firstly elementary science, and secondly to be able to grow the different plants. Grading and packing is largely a matter of business instinct. Once they have been put in the way of it, if they have wits they can do it even if they have never done the actual work themselves.

4438. I suppose, as a matter of fact, you know that the fruit sent over from abroad is always packed very much better than fruit is packed in England?—No, I do not think that is so at all now. I think we have learnt our lesson, and I think we pack our fruit very well now.

4439. I do not know. I think if you were to go to Covent Garden and see how some of it is packed you might think otherwise.—I was referring to what we ourselves do, and when one has once realised the importance of packing and seen it done one can soon learn how to do it.

4440. How many of your students stay a third year?—I think at the present moment we have four out of a total of 12 or 14. Of course they are not by any manner of means all going to be in that particular line of fruit-growers, and four would be a very large percentage, because many of them are not going to do anything at all in connection with fruit, but are going to work on entirely other lines—nurseries for example.

4441. Have you a small percentage who are likely to become fruit-growers?—Not a small percentage, because, of course, our total number at present is only a little over 30.

4442. Do you keep any record of students after they have left you?—Yes, we have a pretty good record. We gave that to the Committee last time.

4443 (*By the Chairman.*) Do you send out any instructors to local centres?—No.

4444. All the teaching is given at Reading?—Yes; with the exception of occasional lectures to which I have just referred, all the teaching is given at Reading.

4445. Are those occasional lectures well attended?—The attendance varies a good deal; sometimes there are a good many, and sometimes there are only a few. It varies very much.

4446. By whom are they attended?—By the right sort of people—by the gardening class and people interested in allotments and so forth.

4447. Principally by gardeners and the owners of small allotments?—Yes.

4448. When orchards are being laid out do they come to you and consult you as to how to lay them out?—No; they generally lay them out first, and when they have failed they come and ask us why they do not work. We have renovated several orchards, but never laid any out.

4449. You would be quite prepared to give advice in that direction if asked?—Yes. When we started, I might say, I thought we should probably be very frequently asked for advice on that point, but one finds that people do not usually ask until they are in trouble.

4450. To what do you attribute that?—Well, to Englishness, I think.

Dr.
F. W. Keeble.
—
28 May, 1907.

Mr. RICHARD P. WARD, called and examined.

4451. (*By the Chairman.*) You are Director of Education to the Cheshire County Council?—Yes.

4452. You are prepared to give the Committee some information with regard to the establishment by the Cheshire County Council of the Dairy Institute at Worleston as a Dairy School?—Yes. The Dairy Institute at Worleston was established prior to the commencement of the County Council's work. It was established originally in 1886, that is, I think, before the date of the Paget Committee, and it originated somewhat in this way: Several gentlemen and farmers interested in cheese-making and agricultural work formed themselves into an association and issued some shares, and got hold of a farmer who was willing to let them have the use of his premises for dairy teaching on condition that they bought his milk in the morning and evening. They did that, and also bought milk from other people around at the ordinary market prices at which it could be obtained, and then they placed there a competent person to give instruction in cheese-making, and took in persons who wished to have information given to them in regard to cheese-making and dairy work generally. That went on from 1886 up to 1891, when the County Councils began their work with the money that was voted to them under the Technical Instruction Act. Then the Worleston Committee or Association approached the County Council and asked them to take over their work at Worleston, as they would have better means at their disposal for doing it, and be able to develop it to a very considerable extent. The County Council was prepared to do so, or rather I should say it was prepared to do it in conjunction with the Cheshire Chamber of Agriculture. The estimate that was given to the County Council at that time was that it would cost something like £1,500 in order to carry out the scheme as then set forth, and the County Council offered to bear the cost to the extent of £1,000 provided the Chamber of Agriculture would find the other £500. That was the commencement. In 1891 the tenant who held the farm at Worleston resigned, and it was then thought best that the County Council should take the farm from the owner, Colonel Cotton-Jodrell, and for the county itself to stock the farm and work the place, and make such alterations as were necessary for the successful carrying out of dairy instruction. Colonel Cotton-Jodrell was quite willing to fall in with

this view, and he let the farm to the County Council on a 20 years' lease, and he undertook to make very considerable additions to the house in the shape of new dairies and new cheese-rooms, and also converting the house into a condition that pupils could be taken there into residence. When we began to look into the matter as to what this would cost, it was found that to do these things would involve a much larger sum than Colonel Cotton-Jodrell was prepared to spend, and ultimately an arrangement was made between him and the County Council that he should spend £750, and that for the rest of the money that was required for these developments he should be paid interest at the rate of 5 per cent., and that such amount be added to the rent that was given for the place. That was the arrangement made by the County Council with Colonel Cotton-Jodrell, and that has continued from March, 1892, up to the present time. During these years I may say that the County Council has made very considerable alterations and additions to what were first carried out in the shape of putting up additional buildings, and Colonel Cotton-Jodrell himself has also renovated completely all the cowhouses and shippens so as to make them more of a modern kind than was the case originally. The County Council has stocked the farm, and very much improved it. When we took it I think there were about 38 milking cows. At the present time we have 56 cows milking on the same farm, besides a considerable quantity of young stock. It has been found necessary also during these 15 or 16 years to considerably enlarge the size of the dairies; the cheese-making dairy has been enlarged and the butter-making dairy has been added to. That, I think, is information in regard to the establishment of the place.

4453. Do you do any actual breeding at the farm?—We do not do much cattle-breeding there beyond simply saving the best of our calves each year, and gradually bringing them into the stock when they come to two years old or rather more. We only keep the very best of the calves.

4454. Is there a cream factory there?—No, there is no cream factory: we simply deal with the milk that is produced on the farm, and we turn the largest portion of the milk into cheese. We also make a sufficient quantity of butter to give the students a practical illustration of the work which they have to carry out, but attach the greatest importance to cheese-making.

4452a

Mr.
R. P. Ward.
—
28 May, 1907.

4455. (*By Lord Belper.*) Do you purchase any milk ?—Not at the present time. We have at times done so. A few years ago we purchased milk from the farmers around at the same price that they could get for it by sending it to the milk factory four or five miles away, but for the last few years we have produced sufficient for our own purposes, and not purchased any.

4456. (*By the Chairman.*) What is the staff of instructors at the school ?—We have a Lady Principal, who is responsible for the whole of the dairy instruction, and she has a well-qualified assistant, and from time to time we send a member of our lecturing staff to the County Council to give special instruction—what I may call instruction in the chemistry of dairying.

4457. Is there a chemical laboratory at the school ?—Yes, we have built a laboratory, not a very well-equipped one, but a laboratory sufficiently good for the purpose of what we want to illustrate there.

4458. Is there any research carried out at the school ?—No ; I should not say that there is any research work carried out at the present time—not in the strict meaning of the word “research.”

4459. What is the main aim of the school ?—The main aim of the school is to give good instruction in the making of Cheshire cheese and also of butter.

4460. To farmers' sons ?—The students are restricted entirely to women at the present time. When we first established the place we had the house arranged in a dual way, so that we could take both male and female students, but it was found that did not answer, and consequently we restricted ourselves entirely to female students. Sometimes, I may say, we do get an application from a male to come to take instruction there, and under such circumstances we obtain lodgings for him in an adjacent house, so that he simply comes to the Institution to receive instruction in dairy work ; but in the county of Cheshire almost the whole of the dairy work is done by females. It is a very rare thing to find a male who does any dairy work, and consequently the applications for dairy work from males are very few indeed.

4461. Are your women students all resident at the farm ?—The majority of them are ; indeed, almost the whole.

4462. Where do the others go—are there lodgings for them ?—There are some students who drive in each morning and home again at night.

4463. Are they daughters of farmers who attend your school ?—The majority of them are daughters of farmers. I should say that 80 to 85 per cent. of them would be daughters of farmers ; but we do not restrict ourselves to daughters of farmers. We have had students from various other classes, and some of the very best students have not been farmers' daughters at all.

4464. But have come from other classes ?—Yes. I will illustrate my meaning : sometimes perhaps a doctor or a professional man may die and leave his family very poorly off, and some of those daughters, in search for a means of living, may wish to take up dairy work in order to qualify themselves for dairy teaching, and so on. We have had several cases where persons of that kind have come to us, and they have not had the slightest knowledge of dairy work when they have come, but have made splendid students—some of the very best students that we have had.

4465. What is their career afterwards when they leave you ?—One or two of them, at the present time, are instructors in dairy work in other counties in England, and one of them, that I can call to mind, is the head of a dairy establishment in South Africa ; another one of that class is I think, at Cairo doing dairy work there. Then again some of this very same class have gone out into the county to manage dairies for persons, and in one or two cases they have married farmers.

4466. You do not give any instructions to dairymaids themselves, do you ?—Yes, we do. It is a very common thing, indeed, for gentlemen and ladies, who have small dairies, to send their dairymaids for a few days to get special instruction—probably in butter making.

4467. Do they attend different courses from the courses that are attended by the daughters of farmers—the 85 per cent. that you mentioned ?—No, there is no difference in the course except that it is for a shorter time. They come for a special purpose, and they only stay until they have got that purpose served.

4468. They were not included in the 85 per cent. you gave us as being the daughters of farmers ?—No.

4469. That is a separate class, as it were ?—Yes.

4470. How many of them are there of that class ?—I can best tell you, perhaps, by giving you the number of students of last year, and you can see in what classes they come. I see that during the year from the 1st April, 1906, to the 31st March, 1907, we had at the Institute altogether 73 pupils ; of those two were there for 36 weeks. Those would be students who wanted to prepare for going up to take the examination of the National Diploma ; they stay there a considerable time to prepare for that. Then we had two who remained for 30 weeks ; 33 who remained for 15 weeks. Those 33 would all be persons holding scholarships granted by the Cheshire County Council. Each person who holds one of our scholarships is compelled to remain for 15 weeks, because we consider that they could not get sufficient instruction in cheese making and butter making in a less period than 15 weeks. There were eight persons who stayed for four weeks ; eight who stayed for three weeks ; four for a fortnight ; 10 came for one week, one came for three days, and five came for one day. Those persons who came for the one week or the three days or the one day would be persons resident in different parts of the county who came to take up some special work, most probably working in butter making, or they might be wives of farmers who had met with some difficulty in their cheese making, and had come in order to get special instruction on some particular point. We have a great many who come in that way. A farmer's wife probably finds that her cheese is not turning out as it ought to do ; she does not quite see the reason why, and then she comes to the Dairy Institute for one day or two days, and gets to know from the Dairy Instructor the particular point on which she is wrong in her dairy work, and then she is able to go back and put the thing right.

4471. What do you consider the length of the normal course at your school ?—The length of the normal course is 15 weeks.

4472. Are there some who return after having attended for 15 weeks, for a longer course ?—There are a few. We grant scholarships for 15 weeks, and at the end of 15 weeks we hold an examination both theoretical and practical. Each student has to make a cheese under the eye of the examiner, and that cheese is put on one side until it is ripe, then it is examined by a cheese factor who tests it for its value, and the marks for that and for the examination previously are put together, and in that way the qualifications of a student are obtained. Sometimes we find that some of these students who have held their scholarships for 15 weeks are not so proficient at the end of the time as we could wish, and some of them will then, probably, stay on longer and pay for themselves.

4473. Have you some who have come for 15 weeks who also pay ?—Yes.

4474. From other counties ?—Yes. At the present time we have some, but not many, from other counties. Most of the counties around have now got their own dairy schools. When we first began we had a considerable number from other counties, but now we have not got a large number, only a sprinkling.

4475. It is mainly for Cheshire ?—Mainly for Cheshire.

4476. What is the total cost to the county of carrying on the Institute ?—The cost has been various in the different years. I can give you the exact cost last year ; that will perhaps serve the purpose. It cost the county last year £805.

4477. (*By Lord Belper.*) Do you mean the net cost to the county or the total cost ?—That is the total cost to the county—the total expenditure on the Dairy Institute last year was £3,435, and then the fees, and the cheese and butter, and milk, and cattle and pigs, and other things sold came to £2,630, and the balance was made up by the County Council.

4478. That was £805 ?—£805, but I should say that is rather an unusual amount, because last year we took 20 acres additional land, and we had to purchase additional stock, which is included in that £805.

4479. (*By the Chairman.*) That you would consider working capital ?—Yes. You might consider the Institute usually costs the county about £500 to £600 a year.

4480. (*By Lord Belper.*) The average net cost per annum that the county has to provide is about £500 a year ?—Yes. Last year was a special year on account of our having to purchase additional stock.

4481. (*By the Chairman.*) That includes the scholarships ?—No, that does not include the scholarships. The scholarships are paid for out of a different fund—the scholarship fund. We paid for scholarships last year £224.

Mr.
R. P. Ward.
28 May, 1907.

4482. That is a separate fund?—That is a separate fund.

4483. Then you have peripatetic classes in dairy work?—Yes, we have some peripatetic classes in the eastern side of the county, of which Macclesfield is the centre.

4484. Who undertakes those?—The teacher for those classes is Mrs. Blackshaw, a farmer's wife, and she has taken the classes from the very beginning—from 1891.

4485. Are fees paid for those classes?—No. There is no fee paid by the students who attend the peripatetic classes.

4486. The county takes the whole cost of those?—Yes, the whole cost of them. The peripatetic classes consist of cheese making and butter making—in the winter, butter making alone, and in the summer time both cheese and butter making. These are held in farmhouses. We have an arrangement with the farmer, and he provides all the milk necessary for the cheese making or butter making, and he keeps the produce and we pay him a couple of guineas for the use of his rooms and utensils. We undertake further that if any of the cheese or butter that the students make at these classes is spoiled, we will bear the loss; but in all the years from 1891 until now we have never been called upon to pay a shilling.

4487. Can you give the Committee any information on other matters affecting agricultural education in Cheshire?—Yes. Would you like me to give some further information as to the quantity of cheese and butter that is made at the Dairy Institute, to give you an idea of the amount of work which the students carry out?

4488. Perhaps you could hand us that statement, and it could be included in your evidence. I do not want to trouble you too much at the moment?—I can give it you in a moment or two.

4489. By all means?—I see last year we made about 11 tons of cheese. That cheese sold for £768; that is practically speaking an average of about 70s. a cwt., but last year the price of cheese was good, more so than usual. I think it speaks very well indeed for the students when I tell you that the whole of this cheese is made by the students—that they have to take part in the whole of the work themselves from beginning to end, and do all the cleaning of the dairy and the cleaning of the vessels and everything, and yet we are able to sell the cheese at as high a price as most farmers can make for their cheese.

4490. Will you give us the average for three years, perhaps that would be the better way?—I have not got the average for three years. Last year was, perhaps, rather higher than usual.

4491. You can perhaps send us a statement to that effect, giving the average for three years?—Yes.*

4492. Your school is thoroughly appreciated by the farmers?—Yes, it is very much appreciated. I can prove that in a very simple way. We have a great many more applications from persons to come to the school than we can find room for, especially in the spring of the year.

4493. You make a selection do you?—Yes.

4494. By competitive examination?—No, not exactly by competitive examination. We ask the candidates for scholarships to come before a Sub-Committee consisting of three persons and myself. We question them closely about their past life, but more particularly as to what their object is in coming to the Institute. If we find that their object is to make themselves into dairymaids in order to earn a living, or to become teachers of dairy work, or for the purpose of preparing themselves for being married to farmers, we look upon those applicants as being suitable students, and give such the preference.

4495. Some of your students afterwards undertake instruction in dairying?—They do; but the majority of them are now managing dairies for large farmers, and we have more applications for students to go out to manage dairies, or to become assistants in managing dairies, than we can supply.

4496. Do some of them go to the Colonies?—Yes, some of them have gone to the Colonies. We tell the students when they come in that unless their work and conduct is such that we can approve, we shall not recommend them for situations, because we feel it is a great responsibility for us to recommend a student to a gentleman, or to anyone, to manage his dairy.

4497. Is your school connected with the National Dairy Institute?—In no way, except that we sometimes send students up for its diplomas.

4498. I mean the British Dairy Institute at Reading—are you in any way connected with them?—No, not in any way.

4499. Do you send your pupils up to be examined for the National Diploma?—Occasionally we have a pupil who wants to go, but we do not profess to train them for that. There are several reasons why our students do not take up that Diploma, but now and again we have one or two that wish to do so, and under those circumstances we give them the training that is necessary, and we send them up.

4500. They then require some additional training?—Yes. In that case they require additional training, and also a considerable amount of theoretical knowledge in agriculture and chemistry.

4501. Where do they obtain that?—We have to make provision by sending a special lecturer to give them information of that kind.

4502. You undertake that?—Yes.

4503. You do not send them to Reading or to such like institutions for that purpose?—No. Another reason why our students do not care to go up for the National Diploma is that perhaps they want to manage their father's dairies, or to be married to a farmer, and they have no wish to become teachers. It is in the case of those who wish to become teachers that it is to their interest to get the National Diploma in Dairying. Another reason probably is that we at Worleston only go in for Cheshire cheese-making, not for other kinds of cheeses, and for the National Diploma you have to know how to make other kinds of cheese besides Cheshire cheese.

4504. (*By Lord Belper*) Do you teach nothing but Cheshire cheese-making?—Now and again we make a little Stilton, but we do not profess to teach the making of all other kinds of cheese.

4505. Students going abroad or students resident in other counties would require further instruction than you give them?—Yes, we only go in for Cheshire cheese. Our farmers consider that pays better than any other cheese, and as our Institution is for the use of the county, we do not consider it desirable to take up other kinds of cheese-making. We encourage our students to take situations in large farmhouses as what I may call "improvers"; that is, where the wife has a family to bring up the farmer is very glad to have somebody who can help his wife. Many of them go as improvers and are there for a year or so, and then they are able to take situations on their own account afterwards.

4506. There was one point you mentioned, and I was rather surprised at the way you put it. I am not quite sure that you intended it. You said that there was no spoilt cheese or butter at all, although it was all made by the students. Surely in any instruction there must be a certain amount of stuff which is not first-class produce, owing to its having been made by students who, in the process of learning their work, cannot have thoroughly acquired the requisite knowledge?—We have not had any spoiled. There may have been just an odd cheese now and again, but it is a very, very rare thing.

4507. I am only asking the question because I am thoroughly conversant with one of the largest dairy colleges where the instruction is of a higher class than that given at your Institute, and there there is a considerable amount of produce made which would not command the highest price in the market, because it has been made in the course of instruction by the students, who are perhaps not at the time entirely conversant with the work. Of course a good deal of it is consumed on the place itself by the students, but surely there must be in any place of instruction, unless the things are reconstructed afterwards, a good deal of stuff made that is not of the highest class?—I must say there is not any large amount spoilt in that way, but we do not put a batch of new students to do the work entirely by themselves to begin with; there are always some students there who have had some experience, and the new ones go in along with the experienced ones for some little time, and the cheese-maker herself is standing by and watching these things most carefully.

4508. I thought you said they were made entirely by students themselves?—So they are, under the guidance and direction of the teacher.

* The Witness subsequently forwarded a statement to the Secretary showing that the average prices obtained for cheese made at the Institute were: 1904-5, 55s.; 1905-6, 63s.; 1906-7, 69-9s. per cwt. of 121 lbs. (See Question 4546.)

Mr.
R. P. Ward.
28 May, 1907.

4509. Are the students, when their instruction first begins, so competent that they can make cheeses which command the higher prices in the market? What do they learn in the course of their instruction?—I do not say the students alone when they first begin.

4510. That is what I gathered from your remark?—The students who first come in are put along with someone who does know something about it, and the teacher is always present to direct.

4511. Then it is not entirely made by the students?—They are made by the students as a body—there are three or four students in one batch, and the teacher supervising.

4512. You lay yourself out for the instruction of girls and women in your own county who want to learn dairying?—Yes.

4513. You do not encourage many students from outside the county?—No, we do not encourage them, but we have them regularly coming, a sprinkling of them; we do not, however, lay ourselves out specially to invite them to come.

4514. Do they pay higher fees?—Students from our own county pay 10s. a week, and those from other counties £1.

4515. Students in your own county are offered scholarships?—Yes. The County Council pays the fees of those who have got scholarships.

4516. Do they pay nothing?—Nothing.

4517. Not even for their keep?—No.

4518. The scholarships pay for the whole of their instruction and their board and lodging?—They are at no expense whatever to themselves.

4519. What would the outside students pay?—10s. a week; that covers everything.

4520. That will not cover their instruction and their board and lodging?—That is all we charge them; the rest is made up out of the County Council money; we charge them what we think covers their board.

4521. Then you do not instruct outside students for a lower fee than they cost you?—We charge them such a fee as we think simply covers their board, that is 10s. a week.

4522. What is your object in allowing students from other counties to have their instruction and their board and lodging at lower than cost price?—I do not think that we do for students from other counties; we charge students from other counties £1 a week.

4523. I was asking you about other counties, and I understood you to say 10s.?—I thought you meant outside our scholarship students.

4524. No, outside the county I meant?—Outside the county we charge students £1 a week.

4525. That explains it; £1, you think, about covers the cost?—We think so, about.

4526. Not more, certainly?—No.

4527. (By Mr. Latham.) What is the size of the farm?—163 acres, and it is all grass.

4528. You keep these 56 cows exclusively for the dairy?—Exclusively for that purpose.

4529. The Chairman asked you if there was a different course for dairymaids from that for people in a higher sphere. There is only one course for dairy work, I think?—That is all.

4530. No matter who they are?—No matter who they are; they are all treated alike when they come there; no distinction is made.

4531. I should like a little more information with regard to these pupils. What are the 36-weeks' pupils supposed to learn during the 36 weeks?—Those who were there for 36 weeks were, perhaps, when they came, people who had not the slightest knowledge of cheese-making or dairy work at all, and consequently stayed on in order to make themselves as efficient as possible.

4532. I take it the scholarship-holders are very much in the same position?—No; a great many of them are from farmhouses, and probably know something about the work.

4533. They have been taught at home?—Yes, they have been taught something about it at home.

4534. At what age do they come to you?—No one less than 15, but as a general rule the students are from 18 to 19 years of age, sometimes much older.

4535. The scholarship pupils are pupils who have learnt

something at home in their own fathers' dairies?—Yes, they often know something about it. I should state that a great many farmers in the country go in for selling milk at the present time, and we have a good many students who come from homes where they are able to milk, and they know something about milking, but they do not know anything about butter-making or cheese-making, because the milk is sent away from their houses.

4536. What is the value of these scholarships? I think you told us that £224 were received for scholarships. What is the individual value of them?—We pay 10s. a week for each scholarship-holder at the Dairy Institute.

4537. What do you consider the scholarship that the County Council offers to the student is worth?—We pay the 10s. a week, and then any balance that is required for meeting the cost of the Institute would be met by the county in addition.

4538. I quite understand that; but I want to know what you consider is the value of the scholarship to the student?—At least £1 a week.

4539. They are there for 15 weeks?—Yes, 15 weeks, each of them.

4540. So that it would be £15, and that includes the education and the keep?—Certainly.

4541. Is 15 weeks sufficient time in which to teach cheese-making properly?—Certainly; if a girl is sharp and intelligent, and has some little knowledge of it, she will make a good dairymaid in 15 weeks.

4542. But do they know something about it before they come?—When I speak of some little knowledge of it, I mean a girl who comes from a farmhouse and knows what milk is, and probably is able to milk, and has seen cheese made, though she may not have taken any great part in it herself. But we have had cases where girls have been able to make cheese in 15 weeks who have had no previous knowledge.

4543. I was much struck by Lord Belper's question about the produce, and I cannot quite imagine how every bit of the produce can be good?—We have never had any bad produce, and we do not consume in the house, in the way suggested, any bad produce.

4544. I think I may fairly take it for granted that you never let them make anything that you are likely to dispose of till they are fairly efficient?—There is always some fairly efficient one who has got the main control of it. In teaching cheese-making you have a vat, and you have one of the students in charge of the vat, and the others are brought into the way of doing it gradually, and by careful management we prevent any loss; of course the teacher is always there to direct and take part if required.

4545. Up to a certain point they are eye-witnesses rather than workers?—Not exactly eye-witnesses. There are lots of things they can do without being made responsible for the whole process.

4546. I should be very glad if you could give us a little idea of about what your prices were for your produce three years ago?—I could not give the prices three years ago. I have not prepared myself for that, but I have got them for last year, and the lowest price was 55s. a cwt. But our cwts. are 121 lbs., remember. The highest price we sold at last year was 80s., and that works out at 69-9s. per cwt. for the year. I want to point out that last year was a very good year for cheese, and the lowest price in other years has come below 55s.

4547. Now, with regard to these shorter times, you say five for one and ten for another?—Yes.

4548. What is the principal education of these people?—These would be mainly people who have met with some difficulty in regard to the making of cheese at their own homes.

4549. What kind of difficulty would that be?—Sometimes they find their cheese turns out what we call weak cheese, and they cannot quite understand the reason of it, so they come to get information from the chief dairy instructor as to what has caused this in their cheese. Probably they find sometimes that they are making their cheese too acid, or various other matters may arise in the making of it, and they come here for a short time to get information and watch the work done, and then they are able to find out what the difficulty is, and go back again with the information they get.

4550. Sometimes they are troubled with flavour, are they not?—Yes, sometimes.

4551. Is not that time of two or three days much too short to get any good in?—They come at their own option,

Mr.
R. P. Ward.
28 May. 1907.

and stay till they think they have mastered the difficulties. We do not lay down any definite rule that they shall stop so many days.

4552. Have you any way of testing for the purpose of finding out the cause of any flavour or taint?—No, we are not able to follow that out in regard to these people who come to us.

4553. Where else do they go to get a remedy or information?—I do not know any other place excepting that they come to us. There have been a few instances where a person has had a difficulty in the dairy and she has asked us to send our own dairy instructor to manage her dairy for a few days, and we have done that.

4554. Has that been found efficient?—It has generally put it right.

4555. Does your County Council keep up its grant?—Yes.

4556. I take it that the chief agricultural industry of Cheshire is almost entirely the industry of cheese-making?—It is the most important industry in the county. New milk has increased to a very large extent in the last few years.

4557. But still they do send a lot of milk to London?—They send a lot of milk to London and to Manchester and Liverpool.

4558. Do you still continue the dairy school?—Yes.

4559. The itinerant dairy school?—The peripatetic classes, do you mean?

4560. Yes.—Yes, we have those classes, but we are not holding those to so large an extent as we did a few years ago.

4561. Why, may I ask?—We did not think there was such a great necessity for them.

4562. I rather took it, in reading the book, that they were feeders to your school?—They are to some extent. The persons who come to a peripatetic class for six or eight days often become students and come to our school afterwards.

4563. Are they principally farmers' daughters?—Mainly so.

4564. The book says that 14 remained at one centre eight days?—Yes.

4565. And some remained six days, and some four days?—Yes.

4566. What do you say about the eight days' instruction?—The eight days are for butter-making in winter when people can come up. The four-days' people are for cheese-making in the summer months, when it is difficult to get them together.

4567. That is very small instruction, is it not?—It is not instruction qualified to give a person complete knowledge of cheese-making, but those are only persons wanting information upon some particular point.

4568. They are really more for luxuries, are they not?—Mrs. Blackshaw, in conducting the class, gives them short addresses upon how to deal with the matter.

4569. But there is no cheese-making taught, is there?—The cheeses are actually made.

4570. But not by the students?—No, they are made by Mrs. Blackshaw, and these people stand round and listen and give assistance, and she explains the details to them.

4571. That explains, I think, why you have no bad cheese, because the teachers make it in the earlier part of the time?—Yes, probably it may.

4572. (By Lord Moreton.) Do you have an open examination at the end of the course at your school?—Yes.

4573. Do you give anything in the nature of a certificate or anything of that kind?—We give a certificate, which is simply a certificate stating that the person has been in attendance for a certain time, and has passed the examination held there. We do not issue a diploma.

4574. But you do give a paper?—It is an acknowledgment of their having attended.

4575. Do you give any instruction in milking?—Yes. All the students are asked to take their share in milking. When people come to us for scholarships we ask them, "Are you able to milk, and are you prepared to take your share in milking when you go to the dairy?" and if they answer "Yes," they take their share.

4576. I take it the prices you have given are the prices of the produce manufactured at your institution. Could you add to that the market price for the same period, so that we might compare the market price with yours?—I am afraid it would be difficult for me to do that, but we get the highest market price.

4577. But we should have liked to see how much higher your price was than the market price?—I will try to find out the price at the time as well as I can.

4578. You will agree that would add very much to the interest of the table?—Yes.*

4579. As regards the National Diploma in Dairying, I take it your teaching is practically for Cheshire and Cheshire methods only?—Our aim is for Cheshire methods.

4580. Therefore, you have not really very much experience of the working of the National Diploma Examination, and have not sent up many students?—Not a large number. Some years we send two or three, and some years none at all. It depends on whether the students want to take the Diploma or not.

4581. Do you consider that some such examination is of value?—The National Diploma?

4582. I do not say that, but an examination of such a character as that—is it of value to the country at large?—I should say it all depends on the way it is carried out.

4583. Are you prepared to answer a few questions on what is put down earlier in the abstract about other matters as to agricultural education in Cheshire?—Yes.

4584. Will you tell me if there have been many peripatetic classes in other subjects besides dairying?—Do you mean throughout the county?

4585. Yes, in other subjects.—Yes, we have a great number of evening classes of different kinds, but most of the subjects that are taken up do not touch upon dairy work.

4586. What do they touch upon then?—Instruction in ordinary subjects.

4587. Instruction in what?—In book-keeping, and similar subjects.

4588. Agricultural book-keeping?—No, there are not many evening classes that deal with agricultural subjects—there are very few indeed. We find it almost an impossibility to work up an interest in rural districts in subjects relating to agriculture.

4589. Have you tried to do anything as regards teaching farriery and improving the farriery of the district?—Not much.

4590. We have been told that in many districts in England very considerable work has been done in that way?—We have not done much in farriery in Cheshire.

4591. Have you done anything in veterinary science?—We have done nothing in veterinary work except giving lectures at places where they have applied for them.

4592. Do you have many applications?—Not many. Of course at our agricultural school at Holmes Chapel we give systematic instruction in regard to veterinary work. The applications we have had for veterinary lectures have not been numerous.

4593. (By Mr. Medd.) I daresay the Worleston school is subsidised to some extent by the Board of Education?—Never until the last year. During that year the classes have been in connection with the Board of Education, and we got a grant.

4594. What was the amount of the grant?—£78 10s.

4595. Then I suppose the Board of Education inspect you?—Their inspectors come.

4596. Then I suppose you have a double inspection?—Yes.

4597. It would probably be simpler if you had a larger grant from the Board of Agriculture, and only one inspection?—I should like to say you can hardly call it a larger grant, because we have never had any at all from the Board of Agriculture.

4598. Lord Moreton referred to the agricultural education in the county of Cheshire. You expend a very considerable amount of the "whisky money" upon it, do you not?—Yes, we expend a large amount of money upon agricultural education.

4599. More than a quarter of the total amount?—A very large amount indeed.

* The Witness subsequently forwarded to the Secretary a statement, which he had received from a large dealer in Cheshire cheese, showing that the wholesale average prices were: 1905-6, 58-9s.; 1906-7, 67s. The Witness was unable to obtain the prices for 1904-5.

Mr.
R. P. Ward.
—
28 May, 1907.

4600. Last year it was more than one-third. The total amount is £16,451, and out of that you spent about £6,237 ?—Yes.

4601. The major part of that goes to Holmes Chapel ?—Yes.

4602. Last year you incurred considerable capital expenditure in increasing your numbers ?—Yes.

4603. In fact the appreciation of Holmes Chapel has steadily grown ?—Yes.

4604. The character of the instruction that they get under Mr. Young is somewhat different from what it was even a few years ago, is it not ?—Yes, that is so.

4605. Do you find the present type of instruction is more appreciated by the farmers than what you used to offer there ?—Yes, I think so.

4606. Now in regard to the training of teachers in Cheshire, what is the system of training them at half-a-dozen centres—what do you do ?—That is simply giving them lessons in nature study to enable them to give instruction to children in their own schools. We fix up six centres, one to be taken on each day of the week. The teachers who live within a certain radius of that centre are taken there and given a course of lectures in nature study.

4607. When are the lectures given ?—On Monday, Tuesday, Wednesday, Thursday, and Friday, in the evening, from 6 to 7 o'clock, and on Saturday, in the morning from about 10 to 11.

4608. Who gives the instruction ?—We have a special lecturer for that purpose.

4609. There is no cost to the teachers, is there ?—Each teacher pays a fee of 10s.

4610. That is new, is it not ?—That has been the rule for two or perhaps three years.

4611. But you used to provide free instruction when you had it at Holmes Chapel ?—Yes, it was free altogether.

4612. You find that the demand for the instruction has so much increased that the teachers now are willing to pay for it ?—Yes, quite willing.

4613. And you have not had to close any centre from lack of pupils ?—No.

4614. Now with regard to the school gardens, do you supervise each garden, or are they run independently ?—We supervise them. The instructor in horticulture at Holmes Chapel, who is also the head gardener, has been made the chief instructor in horticulture, and it is his work to draw up a scheme of work for every place where there is a school garden, and he has an assistant who goes round regularly to give lessons.

4615. Does any proportion of that expense fall upon the managers of the individual schools ?—They have no expense at the present time under the new Act. It is paid for by the County Council.

4616. In regard to the farmers and parents, what do they think of the gardening ? Is there any dislike of it ?—I think they are rather favourable to it.

4617. The parents do not object ?—The parents do not object. We have only taken it up in this systematic way for a couple of years. Last year I think we had 15 centres, where we took school gardens. This year I believe we have somewhere about 23 or 24. I cannot give you the precise number.

4618. And they are growing ?—Yes.

4619. Of course you have one or two exceptionally good rural schools in Cheshire, such as Tilston and Bunbury ?—Yes. But they do not take school gardens. One difficulty in regard to this in Cheshire is getting land for gardens. You might as well ask a Cheshire farmer for his blood as ask him for a piece of land.

4620. Then you find the cultivation of these gardens on the common plan is better ?—Yes.

4621. That is your experience ?—Yes, decidedly, and our instructor is very strong upon this point—he thinks that having a separate plot is merely playing with the subject.

4622. Have you Saturday rambles for the teachers ?—Yes, Saturday rambles are part of the course of instruction in nature study. The complete course is about 22 or 24 lectures, and four to six rambles.

4623. Do you give any certificate at the end ?—Yes, we give a certificate for those who pass the examination at the end. It is simply a sort of acknowledgment for

attending the classes, but the teachers like to have that acknowledgment given to them.

4624. Then you may say your efforts in Cheshire in agricultural education are generally appreciated ?—I think so.

4625. The amount that the County Council is willing to give out the "whisky money" is evidence of that ?—Yes.

4626. To what should you ascribe the growth of Holmes Chapel ? Was there any particular reason why an intermediate school of that type should be established there—is there anything which led to it ?—Do you mean what can I ascribe its growing popularity to ?

4627. No, its foundation ?—We felt there was a demand for instruction of that kind for the young farmers in the county.

4628. Had you taken any steps to prepare the ground beforehand ?—Yes.

4629. What did you do ?—We had several applications from farmers' sons and others to give them instruction of that kind, and for one or two winters we held special classes at the Dairy Institute at Worleston. Those were successful, and those induced us to go a step further and establish agricultural schools. Also our lectures were pioneer work for this purpose.

4630. You did not attempt to plant a school there before finding the necessity for it ?—No. We thought there was a legitimate demand for it.

4631. You had Mr. Gordon lecturing at one time, had you not ?—Yes, and he was the first Principal of the school. I think the fact that we have more applications now coming to the school at Holmes Chapel than we can take is distinct evidence of the value which the county puts upon it ; and another point is that we established a number of scholarships tenable at the school at Holmes Chapel, and now we do not give half the number of scholarships we originally did.

4632. That is very striking ?—Yes.

4633. You can fill it up with full-paying pupils ?—Yes, we can. At the present moment we have somewhere about 45 or 46 students at Holmes Chapel, and only 18 out of those hold scholarships.

4634. Is anyone from outside the area from Cheshire represented on the governing body ?—No.

4635. That is entirely the property of your County Council is it ?—Yes.

4636. But of course you admit students from other areas on payment of a higher fee ?—Yes, and we have a number now from other counties.

4637. Do you have any scholarships from other counties tenable there ?—There is one holding a scholarship from the Staffordshire County Council.

4638. And you see no objection to that ?—No, not the slightest, so long as we have room ; but we should always give the preference to students from Cheshire.

4639. Is there any other way in which you provide agricultural education ?—I do not think we have anything special at the present time. We give lectures in different parts of the county in horticulture. These have been rather successful. But during last winter we were not able to carry them on, because our lecturer broke down in health and we had to give them up for the winter. Lectures in poultry-keeping we give to a considerable extent, and also bee-keeping.

4640. As to the evening classes you say the agricultural subjects are not popular ?—No, they are not popular. It is very difficult to get students to come to the evening classes in rural districts.

4641. Then what do you do for the girls and young women particularly ?—Wherever we can get any students to come together for any subjects we are prepared to provide for those subjects.

4642. But of course one feels that the education of the female is quite as important as the education of the male in the rural districts ?—Yes.

4643. You have a system of providing domestic science instruction, have you not ?—Yes, we have a good many classes—not often in rural districts—in such things as cookery, dress-making and laundry-work, and housewifery subjects.

4644. I thought you had some centres ?—Yes, but those are not often in the rural districts.

Mr.
R. P. Ward.
28 May. 1907.

4645. But you collect the girls out of the rural districts ?
—Yes, and we are prepared to go so far as this, that if a student lives in a district where there are no classes of the kind that she requires we will pay the railway expenses to enable him or her to go to the nearest centre where such instruction can be obtained.

4646. That is very important ?—Yes, we do that regularly.

4647. Do you get many applicants ?—Not a very large number.

4648. Are those classes held in the afternoon or the evening ?—In the evening.

4649. That is a difficulty ?—Yes, but people are not at liberty in the afternoon.

4650. They would be at teatime I should have thought ?
—But we mean after 4 o'clock in the afternoon when we speak of evening classes. There are special classes held in some cases between 2 o'clock and 4 o'clock where people could not go out in the evenings. People have a great objection to their daughters being out in the country lanes at night after dark.

4651. Undoubtedly, and there is no reason why a continuation school should not be held at any time in the day ?—Not if you can get the students together. Another difficulty in regard to getting male students in rural districts is that they have to get up very early in the morning—at 6 o'clock perhaps—and if they have been working all day, then when they come to the evening classes they are very prone to fall asleep over their work.

4652. (*By the Chairman.*) In Cheshire lectures have been given for a considerable time in various parts of the county ?
—Yes.

4653. That is lectures on agricultural subjects ?—Yes.

4654. At the expense of the county ?—Yes, at the expense of the county.

4655. Are they well attended by farmers' sons ?—We gave lectures a great deal more a few years ago than we do now, and we looked upon these lectures as a sort of pioneer work to find out the bent of the people in the different places. The lectures are differently attended in different places. In some places there were fair audiences, and in some places only poor ones.

4656. You give less lectures now than you did ten years ago ?—Yes. We have devoted more attention to these permanent schools, where students come for regular work.

4657. You consider that the object of those lectures having been pioneer work there is less necessity for them when the schools are in full work ?—Yes, that is our idea.

4658. Then would you explain a little more in detail what the organisation is for the pupils at the Worleston School who require additional knowledge to that which is given in the 15 weeks' course ? You have mentioned already that where a pupil wished to get additional knowledge you provided it, but who pays for that ?—We pay for it. If the student goes to Worleston and pays 10s. a week, then we provide all the instruction that is wanted for that purpose.

4659. But what I mean is that you have pupils who have earned their certificate at the end of the 15 weeks' course ?
—Yes.

4660. A girl pupil gets a certificate then ?—Yes.

4661. Now I will take one of your scholars who gets, therefore, her tuition free. She wishes to obtain the necessary instruction for the National Diploma, and in that case do you add to your staff for that purpose ?—The principal of the school and the assistant, both of them, hold the National Diploma, and they are capable of giving such instruction as is necessary. We also send one of our special staff to give lectures on the extra subjects that will be required, or to give assistance.

4662. One of the special staff ?—Yes.

4663. The special staff of the county ?—Yes, of our agricultural lecturers.

4664. One of those who give the lectures ?—Yes.

4665. They give that further teaching also, do they ?—Certainly. If they have held one of our scholarships for fifteen weeks and wish to remain longer they pay 10s. a week for the further period that they remain, and we provide the instruction required.

4666. The first 15 weeks are free ?—Yes, the county pays that if they hold a scholarship, and afterwards they pay for themselves.

4667. That ten shillings is not sufficient for the full

course ?—No. It represents what pays for their board. That is all that it really represents.

4668. Therefore the teaching is really given gratis ?—Quite so.

4669. Are there many who enter for that additional course ?—No.

4670. That number is very limited, is it ?—Yes.

4671. That shows that the value of the certificate after the 15 weeks' course, for all intents and purposes, is considered sufficient ?—Yes, because the majority of them want to go out as dairymaids, either to manage dairies themselves or as assistant dairymaids. It is only those who want a training to become dairy instructors or teachers at dairy schools, and the demand for them is limited, because there is not a large number of dairy schools in the kingdom. They are the ones who want to go for the National Diploma.

4672. But in regard to those who attend the 15 weeks' course, is that the class from whom dairymaids are taken ?—Yes, they nearly all go out to be dairymaids.

4673. But I thought they were farmers' daughters ?—Yes. I think probably we are not putting the same definition upon the word dairymaid. Perhaps you mean by the word dairymaid one who goes out as a sort of farm servant.

4674. Quite so.—I do not mean that by a dairymaid.

4675. That is exactly what I wanted to get at. Those who attend the 15 weeks' course are as a rule farmers' daughters who manage dairies ?—By a dairymaid I mean a person who manages a dairy. So that we have been working against each other in regard to the definition of the term.

4676. Quite so. Then those whom we shall call dairymaids in the restricted sense of the word as a rule do not attend the 15-weeks' course, but they attend a shorter course ?—We do not allow anybody to have our scholarships except they will attend the 15 weeks.

4677. But you have mentioned already in your evidence that what I call the restricted dairymaid class come for a shorter period ?—Yes, and those who come for the shorter period are probably either farmers' wives who have met some difficulty in regard to cheese-making, or dairymaids in the sense in which you are using the word—that is, a servant probably to a gentleman who keeps two or three cows, and who wants her trained to make butter and nothing but butter, and of course she can learn to do that in a week or 10 days.

4678. But the point is that the farmers' daughters who come for the 15-weeks' course manage their own dairies at the farms of their fathers ?—Yes.

4679. Or they manage dairies, I suppose, on a large scale ?—Yes.

4680. Or they might, with additional knowledge, become teachers at dairies ?—Yes, or assistants in dairies.

4681. It is probably that class ?—Yes.

4682. But still there remains, I suppose, a large class of those who earn wages as dairymaids ?—No, there is not a large class of those. There are some labourers' daughters who come in with these scholarships, and perhaps a few of those may go as dairymaids in the sense in which you are using the term, that is as a servant. But most of those who have been 15 weeks with us are sufficiently advanced to go as improvers or assistants in the dairy of a large farmhouse. They are practically servants, but at the same time they are receiving a larger salary than what they would do as servants' wages, and they are in a different position rather.

4683. Then do I understand that there is not a great opening for girls belonging to those classes with regard to the employment of dairymaids on wages ?—If they have got sufficient knowledge they account themselves as little better than an ordinary farm servant when they have been that length of time at the work.

4684. But what I mean is are those the daughters of the working classes ? You have spoken in your evidence of farmers' daughters, and I want to obtain this information: What position is obtained at the school for the daughters of the working classes ?—The daughters of the working classes are able to obtain the scholarships just the same as farmers' daughters are.

4685. I quite understand that; but you have mentioned that 80 or 85 per cent. of the students are daughters of farmers, and 15 or 20 per cent. represent other classes of the community—superior classes ?—Not altogether of

M R. P.
Ward.

28 May, 1907.

superior classes, because I am including the labourers in the 15 per cent.

4686. That leaves a very limited number of the representatives of the working classes?—Yes, a limited number.

4687. May I take it that the number of those who attend the school who belong to the working classes is a limited number?—Yes, it is a limited number. I should say that when I speak of farmers I mean every one who comes from a home where they have land and keep cows, let the farm be as small as it may. We have some, for instance, where

they do not keep more than a couple of cows or three cows and have probably eight or ten acres of land.

4688. That is a small holder?—Yes, and those I include in the term farmer.

4689. But I want to get at the question as to the distinctive working classes?—Yes.

4690. Now I understand that the number of representatives of the working classes—that is those who earn wages—at your school is limited?—Yes, that is so, it is limited.

Miss MAY CROOKE, F.R.H.S., called and examined.

Miss
M. Crooke.

4691. (By the Chairman.) You are principal of the School of Gardening at Bredons Norton?—Yes.

4692. That is near Tewkesbury?—Yes.

4693. You wish to give the Committee some evidence with regard to the employment of women who have received a thorough training in the lighter branches of agriculture?—Yes.

4694a 4694. Then perhaps you will explain what your experience has been in that respect?—If I do not go on the right lines, and do not tell you exactly what you want to know, you will, perhaps, say so, and I will act accordingly. I, myself, trained at the Reading Hostel in 1898, when in connection with Reading University College, and then I went on as Instructress in the gardens. When we started at Reading there were just 12 students, and then by the following Christmas we had increased to 24, and in 1899 there were 41 students in residence. After I had finished my training I started first with a small post in the gardens, and finally became head gardener, and gave horticultural instruction in connection with Mr. Iggulden. I left Studley in October, 1905, and started a small school of gardening for myself at Bredons Norton, Worcestershire. Following the headings which I have given as the basis of my evidence, I should like to say that for women who have received a thorough training in the lighter branches of agriculture there are plenty of openings in which, if not riches, certainly a comfortable living may be obtained. But a great deal depends on the women. No doubt a very great deal of harm has been done by incompetent women taking up posts which they have been quite incapable of filling. The reason why this has been so is that their training is quite inadequate for the work that they undertook afterwards. A woman who has not even had two years' training, or a woman who has not even lived in the country, but has come straight from the town, and is entirely a raw hand, expects in two years to take in what it takes a man his whole lifetime to do, and naturally at the end of two years, when she goes out to the post, she is not fit for it. She tries, and does not succeed, and then people either give her notice, or she gives it up in despair. But, of course, the great difficulty is that women of my class, who have taken up the work, have not got the money for training. It was only yesterday, since coming up to town, that I met a girl who is in every way capable of making a success at this work, but she cannot get the money for the training. Her father has absolutely refused to give it. He wishes her to remain at home and live with her sisters, because he has to keep up an establishment. That is the difficulty. Now, as regards openings, I have put them down as gardeners in private establishments, first. There is certainly a demand for trained women, especially for posts that can be worked single handed, or with an assistant for doing the rough work. Perhaps a lady takes an interest in her garden, and she wishes to find an educated woman who can be a sort of companion and speak to her on terms of equality. A woman who could do so would, in many cases, meet with success. In this branch of gardening a woman gets from 21s. to 25s. a week, as a rule. At first we never got less than 25s., but now some women have proved themselves rather incapable, and they do not offer, as a rule more than 21s. a week. She can live on that, and sometimes with 21s. a week she gets a room, and possibly vegetables. Then another arrangement which they make is that they can live in the house, and then they are generally paid about 10s. a week, or £25 a year. But we have never found these posts a success. I think that is very likely because the women get tired—gardening in summer is rather tiring work—and at the end of the day they are not in a state of mind in which they will care to sit down amongst a number of strange people. They prefer to live by themselves, and have their own rooms to go to. But several women,

who trained with me, make a great success of it in private establishments. There is Miss Robinson, who is at Tanglewood Cottage, Godstone, Surrey. She was first with the Hon. Miss Wolsley, who has now got a gardening school at Glynde, for two or three years, and then she went to this post. Then there is Miss Tudor, of Pallas Green, near Limerick. She has been in that post for six years. Then there is Miss Carlyon, who has had two or three posts, and she is now back with me as assistant. She has always been able to keep herself without applying to her father for help. I now come to the class of market gardeners. There is considerably more risk for women in this branch. In fact, it is far better to purchase their experience at the expense of their employers than their own, because they must purchase it, and sometimes, if a woman starts market gardening before she knows where she is, it means a very serious outlay. From personal experience, I should not advise any woman to start as a market gardener before she had considerable experience in all branches of gardening. If they do start as market gardeners it is very necessary that they should have some definite branch of work to take up. They should not try and do a little of everything, because the great thing with the market garden is unquestionably to be able to market in quantity and keep up the supply. That, women certainly do not understand to begin with. They do, of course, after experience, but they have got to get that experience first. They cannot set up without a certain amount of capital. Of course, it entirely depends upon the way that they want to set up as to what the amount of capital should be, but I should not think that any woman ought to set up unless she has got quite £250 to begin with, and at the same time she must have sufficient ready money to be able to keep herself for a year or two years after she has started, or else it means that she cannot get on. However, if she is successful in this branch of the work it is by far the best, because, of course, she becomes an individual, and she also becomes an employer of labour, and she is her own mistress. If she succeeds, though she may not be rich, she has certainly a very pleasant sort of life. There are several of the girls who trained at the same time as I did who are making a success of it. There is Miss Cornelius-Wheeler, and also the Misses Haig, of the Castle Hill Nurseries, Maidenhead. They have done remarkably well. They were both women of great energy and enterprise, and they took a very short training. I do not think either of them were there for more than a year; but they had great capacity for gardening, and now they have got a very large business at Maidenhead, and run their own motor, and are doing very well. As to jobbing gardeners, I do not think that this is a branch of work that it is at all good for women to take up, because the places where jobbing gardeners come in are in the outskirts of large towns, and naturally women feel some diffidence about going round with a wheelbarrow and tools, and a mowing machine, and things like that. Half of these gardens have not got these little appliances. Also, it is very hard work, and the utmost that one could get is 5s. to 6s. a day, that is only 30s. or 36s. a week at the outside, and with that work it would be very difficult to fill up all your days just so that it suited you, in the same sort of place which would be within your reach. It seems to me altogether a very rough branch of the work, and very few women have taken it up. But there is one who has made a great success of it. That is Miss Bowden. She lives at Ealing, but then she lives with her own people, and possibly she gardens a good deal amongst her own personal friends. Then as to owners of small holdings: if a woman has a little capital, say, £50 to £150 a year, and does not wish to incur the risk of market gardening, but wishes to garden, and to make that her occupation in life, there is no better way of doing that than to have her own piece of land, and own little house, and to live on the produce of the land, getting from the land what she needs for her own

maintenance, or else growing one or two crops; or she may grow any quantity, so that she can market them. This has been very little taken up at present; but just now it is beginning to be taken up. At Bredons Norton we have got one or two settling on the land, but there has not been time enough yet to know whether it will be a success or not. But I think, where there are several gathered together it would be a success. Then as to horticultural lecturers, for county councils, I am quite sure there is an opening here, and I consider that trained women would be quite as capable of carrying out the work as the men who are doing it about the districts at present. I only speak for my own district, because that is all I have really experience of. I think, perhaps, the County Council have tried employing women for this work, and they have not been found to be a success; there is no doubt at all about it that the reason for this lies in their want of training, because there is no provision made at all in the horticultural work at the present day to train women as teachers. Any woman who wishes to get on a little, and has got any capacity, can set up as a teacher, and it entirely depends on her knowledge and enterprise as to whether she gets on or not. But a great number of them lack a good deal of the organizing power which is very necessary for teaching and carrying on the work, and it certainly is a want in the education that there are neither examinations nor any test whatever to prove that they are capable of teaching before they take it up. As to women as horticultural experts, that is a point on which I can speak from experience. There is quite an opening for them. If a woman settles in a district, and really has knowledge, there is a good deal of work to be got by going round the private gardens and spending an hour or two hours with the lady of the house or the owner of the house, whichever it is who is interested in the garden, and then, according to what she does, such as pruning or budding, or any of the better class work, she can charge according to her time. I go out a good bit one way or the other round Tewkesbury, and the charge I generally make is 2s. 6d. an hour. If I stay three hours in the morning that is 7s. 6d., and that is more than a jobbing gardener could earn with a hard day's work. It does not mean that I labour at all. It merely means that I do some of the finer and better work and teach them how to do it also. As to dairy maids. The demand for workers in this branch has never been so great as for those trained in horticulture; the posts as dairy manageresses are few and far between, and always have been. But, undoubtedly, the conditions that a woman works under as dairymaid in a private house are not suitable to the women we have trained. However, even in this branch of it there are several who have certainly been making a livelihood out of it. Miss La Mothe trained with me and became dairy instructress at Studley and also at Reading; and there is Miss Hoare, who became manageress of the British Dairy Institute at Reading; and there is Miss Blenkiron, who was for several years manageress at Mr. Marshall Dugdale's dairy farm at Penllwyn. I do not mention in my summary poultry keeping, but thinking over these different lines of the lighter branches of agriculture, I may say there are more people almost who have started in poultry keeping than in any other branch of the trade. There are several of them who are making a very fair success of it, and down at Bredons Norton there are two who have started poultry keeping and they are getting on very successfully.

4694c Then as to my own school of gardening at Bredons Norton, which I opened eighteen months ago, and the general character of the instruction given; the great object of this school, or at least what I try to make the great object of it, is to turn out practical women. I have been close upon 10 years now engaged in this work, and my idea always has been that if the women are to become successful, and really to make a living out of the land it is almost necessary that they should devote their entire time to practical work, because they have got to get accustomed to long hours; they have got to get accustomed to the hard work, because it is hard work, and no one can deny the fact: and they have got to get accustomed to the drudgery and routine of it, and all these things do not come at all naturally to women, at least, not to some women that we get hold of. Therefore, in this school, I give a great deal more time to practical work than I give to theoretical work, but at the same time, I do not neglect theory. I have made an arrangement with the Cheltenham Ladies' College by which the students can take classes in botany, and anything in fact that turns upon their work. Then, of course, the actual horticultural instruction, in the way of lectures, I give myself, and I endeavour, always, to carry on the lectures with the practical work. I also give a thoroughly practical education in book-keeping, because I do not see that if one is going

to be a business woman at all how she can start in any business without knowing exactly where she is in this line. Then I have also a small garden for the French system of early vegetable production. I used to go to Evesham a great deal: Mr. John Idiens brought over a Frenchman and started early vegetable production there. This system is that of small frames and *cloches* on hot beds, and out of these a tremendous lot of crops are got. It is light work and very well suited to women. Last year I put £100 into this special branch to see what I could do with it. I started in October, and before the second week in April I got a crop of 50 doz. lettuce off. I have received, in actual cash, £6 on the lettuce, and I am now pulling carrots and turnips, but I do not know what they will fetch in, because they only came in in May and the month is not yet out, but still, £6 to begin with is not such a bad interest on the money.

4695. Might I ask as to your school how was the capital provided?—I provided it. I put about £250 into it to start it.

4696. (*By Lord Moreton.*) In other words it was a private venture?—Yes, a private venture entirely. The only thing is that I have been very lucky indeed in starting on the property of an American lady, Miss Zula Woodhull, who is extremely interested in this work for women, and up to the present I have had the actual garden, which is a little over an acre in extent, rent free, and just lately a large manor house in which I have been renting rooms. The farm people have gone out, and she has taken that into her own hands, and I have had that rent free for the last three months, because there are a good many improvements going on in it, and the workmen are all about in it, and until all the improvements are finished I am going to have it rent free. That will probably be until next January.

4697. (*By the Chairman.*) You are the principal of the school, are you?—Yes.

4698. How many assistants have you got?—One.

4699. What does she teach?—Horticulture.

4700. And you teach horticulture?—Yes.

4701. Is there any instruction given in dairying?—No, but there is everything ready to start a dairy immediately; the opening is there for it. This American that I speak of wished me to open a dairy in the spring. She offered me six dairy cows straight away, but I did not feel that I was capable just at the moment of contending with it, because my school is just in its infancy, and it seemed to me a great pity to rush into another branch that I was not really capable of managing myself and increasing the expense till I was ready for it, but there is no doubt about it that a dairy, properly equipped, will be opened there in course of time.

4702. That is ultimately your object?—That is ultimately my object. The poultry and bee keeping has been started. I do not do them myself, but I have two ladies down there who are fully qualified to teach both. One was an instructress at Studley, and the other we trained at Studley, and they are both qualified to take pupils; and anyone coming to me wanting instruction in poultry keeping gets instruction from them.

4703. What are the number of students there?—I only have five students at the moment.

4704. Are they resident at the school?—Yes.

4705. For how many have you room?—I have got 16 bedrooms now, but I have only had those quite lately, because when I started I had just to take the rooms in this farmhouse from the people. It was close to the garden, and I just had to take the rooms as I wanted them. The people went out on the 29th September, and since then the house has been pulled about, and practically every month another bedroom has come in.

4706. What fees do you get?—£60 a year.

4707. And you get no grant from the County Council?—No, it has been entirely my own venture.

4708. What is the length of the course?—Certainly two years. I absolutely refuse to send any girl out to do anything under two years' training, and even then I dislike very much them having to go out, because they are not ready in two years. That is the whole fault in the system of this education, that the training period is too short.

4709. You mean two years should be the minimum?—Yes, especially when you think what they have got to cover in two years.

4710. You would prefer to keep them three years?—Yes, decidedly.

4694d

Miss
M. Crooke.
—
28 May. 1907.

Miss
M. Crook.
28 May, 1907.

4711. Do you give them a certificate at the end of the course?—I have not considered this, because it has all been so much done on my own initiative, but I prepare them for the Royal Horticultural examination. Two of them have just been up for it.

4712. To the Royal Horticultural Society?—Yes. I prepare them for the Royal Horticultural Society's certificate.

4713. For the examination?—Yes. This is an examination that practically covers most things in horticulture.

4714. Are those girls farmers' daughters?—No, they are not. They are gentlewomen, and that is what I have tried for in my school.

4715. That is your object?—That is my object, because it is so difficult, when you mix them, to get on. There is always a difficulty about it.

4716. Are the women well prepared when they come?—No, we generally get quite raw girls—possibly girls from the public schools. These are the sort of people who are sent to you as a rule. The women who take it up run very much in two classes. A girl about 18 is sent straight from school to make a profession of it, or else a woman of 25 to 35 comes who has done a lot of things and is tired of knocking about and thinks that gardening would come in well.

4717. You have no help, have you?—Yes, one assistant.

4718. You have need of supplementary education in various ways?—Yes. Sometimes they are very bad in arithmetic, and that is discovered in their book-keeping classes.

4719. Have you book-keeping classes?—Yes, but not at my school. I have arranged for them to be given in Cheltenham at the Ladies' College.

4720. You find there everything in the way of auxiliary accessories?—Yes, they have got very good laboratories and things like that, which would be a considerable expense to me.

4721. Now what do you say with regard to your Women's International Agricultural Club at Bredons Norton?—That was quite an idea of my own. When I was at Reading studying, a lot of women came who wanted to fill in time and to learn a little about horticulture, or to be interested in it, or perhaps they were going to settle in the country, and wanted to be able to interest the country people in, perhaps, school gardens, or something like that, and they would come for instruction. It never answered very well when they came like that, because often they were much older women, and perhaps married, and had settled down to certain rules, so that it seemed to me that there should be some kind of club house, where they could come if they wanted to, or could come to when they had finished their training at one of these colleges. There is an awful risk if a woman takes a place that she will make a failure of it. If she takes a house and undertakes to do market gardening it is a thousand to one she will fail, and I thought if they had a club house where they could come for a year or two, and pay for board and lodging, and have a small plot of land, say, an acre or two acres, or half an acre even, then they could test without any risk of spending a lot of capital whether it would be eventually likely to be a success. Therefore I reserved in this manor house, which I have got, a certain number of rooms, which are called club rooms, and these people come there. I have got one lady there who has half an acre of land and a small greenhouse on it for growing tomatoes only. If she fails she will only then lose what her room has cost for the year. She will have put nothing into the furnishing of the house or anything like that, or into equipping a business, and I on my part will lose nothing, because her room will be there, and whatever she pays will cover her living and room expenses. Then, also, I thought the women who come down from town, who wanted to come to the country for a month or three weeks, instead of doing nothing, might get interested and go into the garden for three weeks, or into the poultry-yard for a fortnight, and so on. That part of the scheme is answering very well. They come in and go into the garden or poultry-yard, and do so many hours work a day when they come down for a holiday. There are also five ladies living in cottages in Bredons Norton village—ordinary village cottages—at a rent of £10 to £20 a year. The most expensive one is £20, and the cheapest one is £8. They are just workmen's cottages, and we do them up artistically. They mostly have a little bit of garden. The ladies settle in these, and they come up to the club house for their meals; instead of being worried by the awful servant question in the country, and all that sort of thing, they can get their meals quite comfortably at the club house.

They are able to live in the cottages and carry on their occupation and practically settle on the land without being put to the expense of actually keeping an establishment. Most of them do everything for themselves, and generally have a charwoman in once a week. One lady goes in for breeding pet dogs, and another is a secretary, and she gets outside work. Then two go in for poultry, and so on; so that in that way the agricultural club is answering very well.

4722. This work is entirely independent of the school, is it?—No, because it is really all done by me.

4723. But the objects are quite separate?—Yes, except that I use one house for all purposes. It acts as a club house, and resident students live there.

4724. (By Lord Moreton.) Do you consider that educational?—Yes, I consider it is the carrying out of the whole thing, because it allows the women who are trained to settle on the land. Most of these women were trained at Reading or Studley.

4725. They are all trained women, are they?—Yes. That is the idea of the whole thing—to get them into these little cottages and let them have their own bit of land so that they may carry on whatever pursuit they feel inclined to. It is also good for the villagers. These women become employers of labour and they are worth a good deal one way or the other for the village people.

4726. (By the Chairman.) Is this club house self-supporting?—Yes, with the exception of the £250 which I put in to start it. That was the capital to equip it.

4727. For furnishing it?—No, not for furnishing, but for the hundreds of things that you have got to get when you make a start. It was not exactly the furnishing, because Miss Woodhull, the American lady I spoke of, has done all the furnishing of the Manor House. The £250 was required for the things you need in starting a garden and equipping it.

4728. That club building is entirely independent of the building for the school, is it?—It is not really, because it is the same building. There is only one and the same building, but they are carried on on entirely separate lines. The building is big enough for everything—both club house and students' rooms. It will no doubt be separated in the course of time when there is a great demand, but at present the one building is big enough to hold both.

4729. But the ladies who are members of the club and the ladies who are your students are anyhow separate?—Yes.

4730. And they do not have their meals together?—They do have their meals together, because I have one big dining-room and they have all their meals in it at the moment, but it will not be always so. There will be a club dining-room.

4731. Your object is that there should be two distinct institutions?—Yes.

4732. For the present they are practically amalgamated?—Yes.

4733. That is for domestic purposes?—Exactly—for domestic purposes. It is for my own private domestic purposes.

4734. (By Mr. Latham.) Why do you call it the agricultural club and not the horticultural club?—Because it embraces the lighter branches of agriculture. If you call it the horticultural club you confine it to horticulture only. But we have got the dairy people and other people there, and it is called international because we do not want to confine it only to English women.

4735. Have you any foreigners?—Not at present.

4736. But would you take them?—Yes, if they came along. Of course if a foreigner came she would not be refused.

4737. (By the Chairman.) Do you consider that the general results of your club are very satisfactory?—I do. I consider it is the carrying out of the training, because I consider that so many women fail after they have trained because they have got no guidance at all. They attempt to do a thing really in two years that it takes a man practically his lifetime to arrive at, and that must mean failure. I am quite certain that a great number of women have failed; they have slipped out of it and we have heard nothing more about them.

4738. Your object is to test their business capacity as women?—That is so, before they are let loose on the public, if you like.

4739. What do you consider the qualification required?—I think the first qualification of all is common-sense, which a great number of people really lack. The

second is, definite purpose. It is very difficult for a woman to be definite. Her mode of life does not make her definite, and she so often does turn aside from one thing to another because of the opinions of other people. Then the third thing is strength of mind to stick to the purpose when she has arranged that she will have one. Then she must have fair average health. I think also that all women who take up the work should have a little capital. It is no good advising women with absolutely nothing to become gardeners, because the outlook for them is not at all hopeful. A woman must give all her energy and strength to her work. We have never seen any old women gardeners yet, because there are not any who are very old, so that we do not know how the life will try them at all or what sort of women they will be at 60 or 70. We do not know that, if you work and can only get 25 shillings a week you cannot save much out of that if you have to live upon it, or at least you have got to be very clever to do it, but if you have £1 a week of your own and you earn 25 shillings a week you can save the 25 shillings for old age or for a rainy day and be quite comfortable on the money. Living the life of a woman gardener you live a much more simple life than the life you live in town, and you can be very happy and comfortable, and in fact almost luxurious, in a cottage in the country if you know how to manage with very little money. Even if it is only £50 a year, there is nothing better to go in for than gardening, but if you have no money at all, and if there is any other profession where women are better paid and they can save more money, they ought to go in for that instead.

4740. Do those ladies who live in the cottages keep a cow?—No; but then they have their meals at the club house.

4741. Then there is no dairying?—No, there is no dairying at the moment.

4742. And you do not intend to have that, do you?—Yes, I do intend to have a dairy.

4743. And also a dairy connected with the club?—Yes, most distinctly.

4744. And with the school?—Yes. It is only a case of it being just the right moment to start it. I do not wish to hurry the thing, because it is developing of itself, and that is a great feature in my opinion.

4745. Your idea is that with a limited amount of capital this can be made remunerative?—Yes.

4746. Both for market gardening and dairying?—Yes—but I do not know about dairying because I am not qualified to speak about dairy work in the same way. There has never been the same training for them. But I know we always worked the Studley dairy at a loss in regard to butter making.

4747. Was the Studley dairy worked at a loss?—The butter making was.

4748. But not the cheese?—No, not the cheese.

4749. The cheese was remunerative?—Yes.

4750. But the butter was a loss?—Yes, the butter was a loss.

4751. How do you account for that?—Because it takes 2½ gallons of milk to make a pound of butter. We were buying the milk for the dairy and the cheapest we could buy was sixpence a gallon, which is cheap. That was 1s. 3d., and the utmost we could sell our butter for was 1s. 4d. a pound. That was the utmost we could get for it, and we could not always get that. Then there was all the outlay for the instructress and all the rest of it, and a lot of places to keep up.

4752. (By Lord Moreton.) Would you mind telling me where Bredon's Norton is?—It is on Bredon Hill.

4753. That is on the north side of Tewkesbury is it?—Yes.

4754. What has been puzzling me is in regard to clause 1 of your abstract where you speak as to dairy maids. All the other subjects I should call horticultural?—What about butter making.

4755. But what I want to ask is as to a thing you mentioned about the dairy. The dairy is yet in the future?—Yes; I have not got a working dairy at the moment.

4756. Do you propose when the time does come for the dairy to start a farm?—Yes. To start a farm and to keep my own cows. I am on a regular farm and I have got the house belonging to the farm.

4757. One great thing in regard to this question is the keeping of pigs. That is a great help is it not?—Yes. I

always keep pigs. My profit on the pigs this last year was £6, but I did not keep very many, but still that was the profit.

4758. I take it you have classes for botany?—Yes at Cheltenham Ladies' College.

4759. What sort of bookkeeping is it usual to have—is it commercial bookkeeping?—The bookkeeping has always been a great difficulty, because when I took my bookkeeping at Reading it always seemed to me it was very much above the heads of the people. I do not think we really understood it. I certainly never could have kept books from it, but I had to. When I came to Bredon's Norton I wrote to a friend of mine, a mistress at Cheltenham, and asked her if she could get me anyone who was practical and who actually had the books of a large business to keep. She recommended me to Messrs. Norman Sawyer, the big printers down there, and Mr. Sawyer has very kindly taken the classes himself. He really has taught us, and so much so that I keep all the books for my place, and I have had them properly audited this year and all are properly kept in a business-like manner. They are just such as we want for the actual business.

4760. It is not the usual commercial bookkeeping but bookkeeping specially adapted to your agricultural work, is it not?—Yes, and as simple as possible.

4761. In your opinion that is amply sufficient to teach you all you require?—Yes. My books could go up to an auditor at any time.

4762. You think it is quite sufficient bookkeeping for your purposes?—Yes. One can only speak from one's own experience, and I have attended the classes from time to time for the last six years but it always seemed to me quite unsuitable for what we wanted.

4763. (By Mr. Latham.) When you spoke of 12 students and of them being increased to 24 and about the 40 students, were they students of Lady Warwick's hostel?—Yes, they were. That was the hostel at Reading when it was first started.

4764. Was the increase to 41 at Reading or Studley?—Reading.

4765. What did you do when you got to Studley?—I, personally?

4766. No, the students?—We mostly took the instructresses with us.

4767. What were the numbers of the students at Studley?—The number of students was 40 then. When we actually took up residence there we brought most of them from Reading with us.

4768. Your own school is an offshoot of Lady Warwick's, is it not?—It is not an offshoot, because it has nothing to do with it.

4769. I did not mean that?—But I was trained for teaching, and I thought I would have a trial on my own account.

4770. It is virtually on the same lines then?—Yes, except that I do not have so much theory.

4771. What did you mean when you spoke of incompetent women?—Do you not think there are a great many incompetent women about?—

4772. I quite agree, but I should like to have a definition?—The incompetent woman in horticulture is the woman who is not sufficiently trained to make herself competent to take up the work.

4773. That is before she comes to you, is it?—No. She does not give a long enough time to her training, I mean.

4774. You did not mean women that had failed in other subjects, did you?—Yes, because the work has an attraction for them, and they think of the open air life and the pleasantness of it. That is the thing that attracts them and they think if they do not make a success of one thing they will make a success with that.

4775. Then you meant women possibly who had failed in other subjects and took up gardening at last as a last resource?—Yes, I think that that defines it.

4776. I notice you omitted to deal with bee management?—We have bees.

4777. Then you do not seem to have said anything about teaching cooking?—No, because we do not teach cooking. If you want that there are so many places for teaching that that I think it is a great pity to mix them up, and there is no time for it. If you are really doing this work you are doing it as a profession. At this time of the year you are practically occupied from six in the morning till dark in

Miss
M. Crooke.
28 May, 1906.

Miss
M. Crooke.
28 May, 1907.

the evening, so that if you had to take a cooking lesson during that time there would not be much time for it.

4778. But is there no occupation for women in going out and giving lectures on cooking?—There is a great opening for them; but that is not the sort of work I do. I know very little about that.

4779. But there are openings for women who have received a thorough training in the lighter branches of agriculture, there is a lot of money thrown away in labourers' cottages over bad cooking?—I quite agree with you there.

4780. One of the best ways for spending women's time would be to go about teaching agricultural labourers' wives how to cook, would it not?—That is quite true, but I have not looked upon that as one of the branches of horticulture or agriculture.

4781. Is it not possibly part and parcel of agriculture?—I did not think of it in that way.

4782. I take a great interest in flower shows and we always give prizes for the women that can produce the best dinner at the least cost, and you may be surprised to hear that tenpence generally is sufficient to win the prize, and if a lady could go round and tell people how to produce a good dinner for tenpence it would be an exceedingly useful piece of instruction and not very hard work, do you think?—Yes, I think so. The only thing is that it does not appeal to me, being a gardener. You must have somebody to do the cooking. You are too much occupied and too tired to prepare your own dinner if you have been doing gardening.

4783. Do you think it is derogatory to the class of women you are brought in contact with to do that sort of thing?—Not a bit of it. Mr. Medd has been over to our place, and has had dinner with us. The dinner was all prepared by gentlewomen, and waited on by gentlewomen. I knew I should never be able to cope with the servant question in the country, so I got back some girls who had trained under me, and one of them took lessons at Marshall's School of Cookery, and others in housework. We have been going on for 18 months now, and we have not had any servant at all except a boy or girl for doing the actual washing up. It is not the case that they would not do the washing up, but only that there is not the time for it. I do not consider it is derogatory for them at all. The more they work in every way the better, and I do not think it hurts them in any way.

4784. Are there ladies that are doing this work old students?—They were old students that I knew personally.

4785. Did they fail in gardening?—No, they did not fail at all, but they had not enough to set up, and I said if you come I will pay you the wages of the housemaid or the wages of the cook, and so they came. We all eat at the same table, and two or three get up and do the waiting. They have a little uniform—a little red coat in winter, and a white coat in the summer. They open the door and wait on the people. I gave a sort of opening day, and they did all the waiting; and they get the teas ready. We have people sometimes motoring up for the day, or coming down from Cheltenham, and they do all the work as to bringing in teas and so on.

4786. I suppose your club-house is more or less a sort of hostel for your establishment?—Yes, I suppose it is.

4787. Are your own students now on the same lines as the students that used to be and are possibly now with Lady Warwick?—Yes, one of them is a student from there. They are the same.

4788. What class are the students taken from?—I have not a bit of feeling that class makes any difference, but I think, where you have got a lot of women together, if you can keep the gentlewomen together it makes the place certainly much easier, and I have in a way catered for gentlewomen.

4789. I did not mean my question to be interpreted exactly in that way. By the class of persons I mean were they doctors' daughters or clergymen's daughters, or what?—Clergymen's daughters and Army men's daughters generally.

4790. These ladies are people who are in a higher class of life, but are unfortunately unable to support themselves without doing something?—Yes. There are a great number of girls whose fathers perhaps leave them a little money, but not enough to keep them, and who do not marry, because in these days there are not enough men to go round, so that you have got to provide something for them.

4791. You spoke of a girl whose father was not willing to

let her go from home?—He was not willing to give the money to pay for the education and keep necessary, and you cannot take them for nothing.

4792. Did he think it was derogatory?—No, not a bit of it, but he has to keep a house, and, like a great many other men, he does not wish that a woman should have any independence at all, and so he likes to keep them in the house, doing nothing possibly. He will not give her the money to go out of it. In your own house you can keep a daughter for 10s. a week; you cannot do it on 10s. a week if you send her anywhere else.

4793. You have been rather inclined to run down dairy-maids. You do not think there is a good living to be made for them in that way?—I do not run them down, but there is not a good opening for them—not for the better class of them. I think there is an opening for farmers' daughters if they train; but I mean really for the better classes, the daughters of professional men, there is not so good an opening in that way.

4794. You know that the County Councils are not doing so much in dairy work as they did do?—No, I did not know that.

4795. The itinerant dairy school is almost a thing of the past. There is nothing like the number of travelling dairy schools there were when you were admitted?—I did not know that at all. But that always was my opinion of dairy work, and when I was thinking of taking up this work myself, I said it is no good taking up dairy work unless you have got a good deal of capital. I do not want to say it would not do if you had enough capital, but it requires more capital considerably to set up a dairy farm than gardening, and there is a good deal more risk to be run, because there is the risk of the animals dying and your being left without them, and women hesitate very much about taking risks.

4796. But in a frosty year there is great risk in regard to gardens?—Yes, but you can contend with that. It is a case of care.

4797. What about your short courses?—The people coming to settle for a short time do you mean?

4798. Yes.—I do not have actual courses. Supposing I met a woman to-night, and she said, "I should very much like to come down, but I am so tied that I cannot leave home for any length of time," I should say, "How long can you leave for?" She would say perhaps, "A fortnight," and I would say, "Then come down for a fortnight." Then she might come down, and if she wanted to do a little gardening she could go into the garden and do that, or, if she wanted to do a little poultry keeping she could go into the poultry yard, and in that way she gets a certain insight into it—not a lot, but quite enough to show her how the thing works.

4799. That would be very little education?—It would not be any practically; but supposing you want an insight into country life, if you are an observant person you can get a very good insight in a fortnight. It depends entirely on your own observation.

4800. That is probably more by way of a visit to you than by way of getting any education?—I do not know that it is, because I have not got the time to entertain them as guests. They must either be picking up what they can, and amuse themselves, or look after themselves in some way. We had a lady down for a fortnight, and she went down every morning for instruction in poultry, and spent three hours every morning at it. She said she learnt a lot. I do not know whether she did or not, but anyhow she said she did. She kept poultry herself, and this was just the incubating season, and you can learn a lot in a fortnight really.

4801. Now, with regard to bee management, do you ever get people to go out over the country to look after bees?—Miss La Mothe, who was down at Bredon's Norton a little time ago, and she was going to go to Derbyshire. I think she went for three weeks. She visited different places where they kept bees, but I have not seen her since she came back.

4802. Do you know Lord Sudeley's place round there, close to Evesham?—Yes.

4803. There was a very large number of bees there, and a young lady to look after them?—Women are capable of managing bees. In fact women are not half so frightened of them as men.

4804. Is that remunerative?—They say bee-keeping is very remunerative.

4805. I know that, but is the teaching remunerative for the instructress?—I do not know what she got. Perhaps Mr. Medd knows what they give for things like that.

*Miss
M. Crooke.
28 May, 1907.*

4806. (*By Mr. Medd.*) £60 to £80 a year.—She was only engaged for a very short time.

4807. (*By Mr. Latham.*) What would you think would be about a fair price for an ordinary lady gardener to get, as a jobbing gardener, say, because you gave us a figure of 6s. just now, and I know a good many jobbing gardeners in London who do not get anything like that?—So much depends on the district as to what you get.

4808. But for the information of the Committee what do you think would be the general pay of these ladies, provided they take up jobbing gardening?—To be quite candid and honest about it, I should not pay a woman for jobbing gardening, because, if I got a man in for 2s. 6d. a day, as you can in the country, I could get much more out of that man than out of a woman.

4809. But I should like you to understand my question more definitely. There are a great many gardens in the suburbs of London that cannot get any attention whatever. Now a woman would be very useful and would get an exceedingly good living in the suburbs if she would go and do most of the work of these gardens, and, according to my experience, from what I saw at Swanley, women are brought up to do the whole of the harder work of the garden, and what would be about the pay the woman ought to receive if she went round and did that in these suburban gardens now, because that is a thing I am very much advocating myself?—You must give a living wage.

4810. You would not think that work derogatory, would you?—I would go for it like a shot. I do not mind what I do, but I was just thinking what would be a living wage for women of my class. I must have certain things. I have been brought up to be accustomed to certain things without which my life would be a misery. I do not mean that they are luxuries in any way, but I should want a decent place to live in, and if I had a room or two rooms in the suburbs of London somewhere I should have to pay pretty heavily for them. I do not know what it would be, but there would be that, and there would be my food to contend with. Therefore, I should have to get enough to cover that to make it worth while to take up jobbing gardening, and some little sum over. But if you did ask 6s. a day people would think you were asking a lot. That is only 36s. a week to live on and everything else.

4811. I can speak from experience as to potting and planting out different beds. That is done by the daughters of many people I know, and would that be considered derogatory work?—No, I consider nothing is derogatory work.

4812. Would it be derogatory work for your students to take up?—No, decidedly not. Only I do not think jobbing gardening is the best form of it, because it is a very hard form of work. You have to go about from place to place to get your work, and it is very difficult to carry on the interest in these small gardens. It is more or less a hard form of life, and I do not know how you would pay a woman if a wet day came.

4813. I do not know that myself, but I have always felt, with regard to Lady Warwick's teaching, that there never can be openings for you all?—No, I do not agree with you there at all. I think that there is an opening for all the women who are capable of taking it up. But the fault of the teaching is that a large majority of women are not capable. Supposing, for instance, twelve women made up their minds to go and settle in a given gardening district, and they either lived in little cottages or at one big house, and they carried on a large market garden as trained women, they would very soon make the place go.

4814. I suppose you will very readily admit that many women have not money?—Yes, I do most decidedly. I think it is the exception for women to have money.

4815. You cannot all get places to look after, like greenhouses and vineries?—Certainly not.

4816. But if this is to be a very great success, most of this outdoor work must come to the ladies' share?—A great number of them prefer outdoor work to work under glass. Nothing is unfit for a woman to do in that way. They manure the ground and turn the manure, and do everything at my place. I do keep a man, but it is only because of the amount of work. It is not that they will not do it, or that it is derogatory in any way to them. All work is honourable: it does not matter what it is.

4817. Do you grow sufficient fruit to be able to grade it and pack it?—Not at present.

4818. Have you had any experience of that kind?—Yes, a good deal.

4819. Do you teach it?—Yes.

4820. As to this system of early vegetable production, have you had any experience of that?—No, excepting as to gardening at Evesham, which has been going on now for over two years.

4821. It is not what you are doing yourself?—I only started in October, and I have given you the results up till April, and I have only started on a small scale. I have only put £100 into it, whereas the one at Evesham, by this time, has had several thousands of pounds put into it.

4822. Have you any idea of getting any aid from outside, such as County Councils, or the Board of Agriculture, or anything of that kind, to assist you in your work should it develop and increase?—I have not thought about it—I have not considered the subject.

4823. Would it be your wish?—Yes, it would be my wish, only, of course, I know perfectly well that once you commence to take public money you must become a public servant, and you must do whatever they tell you to do. I rather wanted to carry this out on my own lines for a special class of women, because I think that the bigger places will provide help in the course of time for all County Council girls, say, but when the bigger places do get help there will be a certain percentage of women who will be prevented going to them. I am not a bit of a stickler for class—I know what I say sounds as if I were, when I talk about it but you have to cater for a certain number who *are* sticklers for class.

4824. If you did do that you would be under some sort of supervision?—Yes.

4825. Would that be irksome to you?—No, I should not mind that. I rather like being under supervision. It keeps you up to the mark, I think. It is only the class I am afraid of.

4826. Then another thing would be your examinations—they would be more severe?—I should not mind that. Cheltenham Ladies' College ought to be able to bring them up to examination standard.

4827. Have you any idea of joining Cheltenham?—I have amalgamated, in a way. I went to see Miss Beale and she very kindly arranged that any education I wanted to give she would arrange classes for, and as we have wanted classes they have had them at Cheltenham. My student goes once a week, regularly, for botany.

4828. Would there be any diplomas or degrees attached to that?—I shall, in the course of time, have a certificate for the school, but at present there is not one.

4829. To what extent is your poultry-keeping carried on?—We have got about four acres now with poultry on. The poultry branch is rather good, but it is just beginning. I have got a very enterprising woman, and we have just taken six acres of land for poultry—that is orchard land.

4830. You have said that you could not make butter-making very profitable. I suppose you have never really tried it?—Yes. I do not mean to say I have actually made butter myself, but I have lived at Studley for two years, also at Reading, where we had a small dairy.

4831. You said butter-making was not a profitable way of farming?—No, I do not think so.

4832. I keep rather a big butter farm and I make it pay quite as well as milk selling?—But you have got your own cows and land. I meant buying in the milk.

4833. I have got my own cows, but I rent the land, and I think it is a mistake to think that butter-making cannot be made to pay. I think it would be a very valuable thing to you if you went in to any extent for it. What do you say to that?—I think without doubt we will have a dairy. We would have had a dairy before now if I had had a little more enterprise. It was only that it was a case of making a start.

4834. You speak of ladies and small holdings. Do you think that is practicable for ladies at all?—I am trying to teach them to be practical. All women are not practical to start with. If you can keep some sort of supervision over them and help them after they are trained, you are bound to help to make them more practical. Women are only not practical because they have not had the training in it of other people.

4835. But small holdings of land in very little quantities would provide a very small living, and the lady would not expect to do the work herself?—She must do it herself.

4836. She could not plough the land herself?—No, but she can always hire horses and labour for a day's ploughing.

4837. I cannot help thinking that if such a person has

Miss
M. Crooke.
28 May, 1907.

a small holding she must do practically all the work herself?—You might as well say that is so in gardening. It would be an awful waste of a woman's time to do the actual heavy digging in the garden, she would physically tire herself out.

4838. If she was a small holder she would be obliged to labour on the wet days as well as the fine?—Yes, but she always goes out on the wet days now. We never know when it is wet with us.

4839. (*By Mr. Davies.*) You told Mr. Latham that your institution had no financial assistance from the County Council or Government?—No.

4840. Would you be prepared to have such assistance if it was forthcoming?—Yes, I think I would, decidedly.

4841. In what way would you spend the money and allocate it?—In improving education. I could not say straight off about that. If I had to start a dairy that would be a considerable expense, and I should have to have a properly trained person to teach in the dairy, because I could not look after it myself. So that in that way there would be a salary to go out.

4842. You would start some new department in connection with your work?—Yes, because it will eventually go on and work itself.

4843. Then with regard to the ladies who live in the cottages, are they there permanently, or only for a time?—They take the cottages by the year. If they fit them up as their home they have got all their household-gods round them, and no doubt they will be there permanently.

4844. So that you really wish to start a colony there?—Yes, that is my idea. Every cottage that comes into the market I take at once myself, and someone turns up for it. I have got two or three people now waiting for cottages as soon as I can get them, but they are not easy to get, and the landlady will not build.

4845. Then it is not your intention that these ladies when they have had their scientific training at Reading and elsewhere should come there simply for a year or two to learn the practical part?—I do take them on for that as well, but then I call them improvers, and they do some teaching. I always keep one improver who helps with the teaching, and she finds what it would be like if she had to do it herself. She fits in with the longer hours, and does more of the work.

4846. I rather gathered from your answer that you regarded these cottages as a stepping-stone between a scientific training and the work of the ladies when they settle down?—I hope they will settle down ultimately and collect in the cottages. Then two or three of them will perhaps take up one branch of market gardening, and two or three another branch, and two or three take up dairy work. I have got two now who have taken up poultry work. So that they will all amalgamate and have a market. It will be all sent up from one centre. That is my idea of the scheme as it grows. The women will be saved all the difficulty of working by themselves in small places, with the difficulty of getting to railway stations. One can take all the produce in that way, and instead of one woman having to keep a cart, the same cart will take the produce of five or six women.

4847. Do you intend them to go out as missionaries in that work afterwards?—I intend them to do exactly as they like. Practically they are doing it, and the only thing I try to do is to get them together and to see what they are made of, and then to try and direct them as to what they are best fitted for. One may be all wrong, but the chances are that you will not be wrong, because you think more about it.

4848. Then I understand these ladies who live in cottages are self-supporting entirely?—The women who live in the cottages are self-supporting.

4849. They do not come down on the Institution?—Oh, dear, no. They come to Bredon's Norton, and they have got enough to take and furnish a cottage. They settle in it, and follow whatever occupation suits them. One breeds pet dogs and whatever she makes out of her dogs she makes for herself, and whatever she loses she loses. That is the way of it, and I take no responsibility. They simply take their cottages, and the only thing I can do is to enable them to live in the country under the best circumstances in the way of household arrangements and domestic arrangements.

4850. Then with regard to the other part of your work, it is entirely separate?—Yes, entirely separate. They have regular hours of work and regular classes.

4851. What becomes of them when they leave?—I have only been there 18 months, and there has not been time for that yet.

4852. How long is it to be for?—These arrangements are for some of them staying two years and some longer.

4853. (*By the Chairman.*) But you will impose a limit to their staying, will you not?—Yes.

4854. You intend to?—Yes. After they have been with me three years, and if they still have money to go on with their training, they must go out to get a more varied training. I consider I shall have taught them all I can in three years, and if they want to specialise in any subject they must go to a place where it is specially taught. I do not mean the cottage people should be limited as to time, only the people who have trained here.

4855. They are under your supervision while they are in the cottages?—If they want any help in their work, if we can give it to them, we do so, but they are really quite independent. They have nothing really to do with us except that they come for their meals with us.

4856. But I thought that your object was to test whether they had the necessary capacity to be launched out?—Yes, but they very soon find out that for themselves. You say to them, perhaps, "I do not think that is the sort of work that will suit you" and so on, but if you saw a woman who was not really going to make a success of it, or hated living in the country, they would very soon go.

4857. What is the tenure of these cottages by these persons who earn their living?—They can go on as long as they like.

4858. You do not impose any limit?—No, none at all. I take the cottage, and then someone comes and says "I want a cottage," and I say "Very well, such and such a one is vacant." And possibly I do the arrangements with the landlord, but that is all. They sign the contract, and take the cottage, and then I have nothing further to do with it, except to help them if they want help.

4859. They need not take their meals with you unless they like?—No, not unless they wish. But they all find that to be a tremendous convenience.

4860. And, of course, you have not any experience yet as to the time they will remain there?—No.

4861. The experiment has only just begun?—Yes, practically only just begun.

4862. (*By Mr. Davies.*) Do you make it a condition that your students must pass through a secondary school before coming to you?—No.

4863. Do you find that most of them have had some sort of secondary education?—No, I do not think so. Most of the girls who come to us have come from schools like Wykham Abbey, and those sort of places; and we have had several from that big school near Brighton.

4864. I mean schools between elementary schools and university colleges?—No; but I do not know enough about women's education to know where they come in, but they come from what we call finishing schools for girls.

4865. Nearly all private schools, are they?—Yes.

4866. Do they get a good education there?—Some of them are ignorant. I am not very well educated myself, but I am often amazed at the grammar in their papers that they send in to us for correction. I have papers every week, and in nine cases out of ten the spelling is bad and the grammar bad. But I am told they do not teach grammar at schools now. It is not considered necessary to learn English grammar, because it is said you are born with it. But, however, I was never educated myself; I was simply brought up in Ireland and had one of those old-fashioned governesses who go on from one generation to another. I know one was taught to write a letter to an educated woman, anyhow, but with a great many of these girls they cannot, and their handwriting is so bad.

4867. Do they get any kind of scientific instruction or any botany?—Yes, sometimes a little botany. It is not so, as a rule, but sometimes we get them having had a fairly good training in botany.

TENTH DAY.

Wednesday, 29th May, 1907.

PRESENT:

The Right Hon. Lord REAY, G.C.S.I., G.C.I.E. (*Chairman*).

Lord MORETON.

Mr. DAVID DAVIES, M.P.

Mr. NORMAN LAMONT, M.P.

Mr. J. C. MEDD.

Professor WILLIAM SOMERVILLE, D.Sc.

Mr. A. E. BROOKE-HUNT (*Secretary*).

Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. J. MARSHALL DUGDALE called and examined.

4868. (*By the Chairman.*) You represent the Royal Agricultural Society?—I do.

4869. You are prepared to give the Committee some information with regard to the agricultural educational work that is carried out by that Society?—I am. I do not think it is necessary to take up your time very much. I believe you have had a copy of these notes and, therefore, it is almost unnecessary for me to repeat that. I have traced out the history of the educational work carried out by the Royal Agricultural Society from the start, and taken from the different reports how it began in 1863, owing to a speech by Mr. Chalmers Morton, and in 1864 a prize of £50 was offered for an essay on agricultural education. In 1866 our examinations were held in connection with the Oxford and Cambridge Locals; in 1868 the first senior examination took place; in 1874 the junior examination was founded. Then in 1890 the Royal got into communication with the Board of Agriculture as to a Board of Examiners being appointed.

4870. I see in 1868 the students all failed in book-keeping at the first senior examination?—That is so, and that is what, I think, is one of the most important things in connection with farming.

4871. (*By Lord Moreton.*) At the same time you would agree with me, probably, that it is one of the most difficult subjects, both for the pupil and for the examiner?—That is so. The question of agricultural book-keeping is a difficult one, but in my opinion, an important one. Then in 1890 the Royal got into communication with the Board of Agriculture and they passed this resolution: "The Committee were entirely agreed that some such examining body was advisable, and they recommended that the Council should co-operate with the Board of Agriculture." That was the next thing. In the same year, I ought to say—I have omitted it from my notes—that Dr. Fream brought out his first edition of "The Elements of Agriculture," which has gone through a considerable number of editions and is quite a good text book still. In 1891 a paper was read by Dr. Fream on technical education in agriculture; in 1895 the question of the central board of examiners was considered at the Council meeting on May 8th, and it was resolved: "That it is desirable that the Board of Agriculture should be asked to convene a conference of representatives of the leading agricultural societies, colleges, and institutions, to consider the question of the appointment of a Central Board of examiners in dairying with a view to secure uniformity in dairying examinations." The result was that, as far as I remember, in October, 1895, a conference met and the question was gone into, but there was nothing definitely decided. In fact, everybody had their different ideas, and it was rather hopeless. On July 31st the Board of Agriculture advised the postponement, I believe, on account of political reasons, more than anything else, in a letter of June 29th. On December 11th the Education Committee of the R.A.S.E. suggested a dairy examination for Diploma. The first examination in dairying was held in 1896. As a matter of fact, I was a steward for that examination, and I helped to arrange all the details, and I have been steward ever since. In 1897 the joint Board of the Royal and the Highland Society was constituted, and the first examinations were held for the National Diploma in Dairying. An examination was held at Kilmarnock as

well as at Reading. In 1899 the Royal Agricultural Society and the Highland and Agricultural Society determined to hold a joint examination for a National Diploma in Agriculture, and in 1900 the first joint examination was held at Leeds. Of course as I say in my notes, in addition to the examinations, there have been the reports in the Journal, which you know about, and also reports from the various Committees, such as the Chemical and Woburn, the Botanical and Zoological, and, possibly, the most valuable of all, the Veterinary Committee, which work in with the Royal Veterinary College. The results of their meetings and deliberations are circulated in the Journal and in other ways. Then medals have been given by the Society to the successful candidates at the annual degree Examinations of the Royal Veterinary College in cattle pathology. As regards dairy work, we have had demonstrations in butter making, given in connection with our shows, and competitions in butter making have also been held at the shows. Lately, what the Royal think is a most useful thing, there have been exhibitions held in connection with the educational work done by the agricultural colleges, and also in forestry. These exhibitions are very largely patronised, and seem to be very popular, and now we have got into touch with the Arboricultural Society, we are issuing a sort of joint medal, so we hope to do still better work in the future than we have done in the past. The colleges, each year, since they have been started, have given an exhibition of their work at the annual show of the Royal Agricultural Society. That is an account of the work up to date.

4872. (*By the Chairman.*) Then I see you give us here the statistics of those candidates who entered and passed for the National Diploma in Dairying and of the candidates who entered and passed for the National Diploma in Agriculture?—That is so.

4873. The number, in 1907, was 93, and the total to whom the Diploma was awarded was 27?—That is so. Of course, it goes in in two parts. The Diploma is only issued after the candidate has passed in the second part. In Part II, 34 went in, and 27 passed, of which one passed with honours.

4874. I see you say six of those 34 candidates passed four of the subjects of Part II. in 1906, and were allowed to come up for examination in that subject only in 1907. What is the meaning of that—"In that subject only"?—If they fail in one subject only, they may go up again. That is in accordance with the rule.

4875. You allow failure in one subject, but not more?—In the second part.

4876. If they fail in more than one subject, they must take the whole again?—Yes.

4877. I see there is an English centre and a Scottish centre. Are the examinations held in both centres?—No. The whole examination is held at Leeds in agriculture. There is a difference between dairying and agriculture.

4878. Why is that?—First of all our English examination was started first. We started at Reading, but they have a very good institute at Kilmarnock, and therefore we thought that the Scottish candidates had better be examined there.

4879. Are the students for the Diploma in Agriculture

4871b

4871c

Mr. J. M.
Dugdale.

29 May, 1907.

4871d

Mr. J. M.
Dugdale.

29 May, 1907.

generally students from the various colleges?—That is so almost entirely, I believe.

4880. You are prepared to give the Committee some information with regard to the training of elementary school teachers?—I have had a little to do with it for a considerable number of years. I was at the conference once at Bilton Grange, held by a considerable number of elementary schoolmasters, and they said they were only too willing to learn if they could only be taught, and since then some of the county councils have had elementary schoolmasters' classes in the vacation. Those have been a very great success, but I think much more could be done if the schoolmasters were encouraged to give more instruction, particularly in the evenings. I think they are pretty keen about it, especially with regard to nature study and that sort of thing, bee-keeping and little gardens.

4881. You think inspectors could give them more encouragement?—I am sure of it from what they have told me themselves. I should like to explain to you how it arose. It was in this way; I was informed that the readers used in schools were often connected with history, and they thought that in the country schools it would be a good thing if they had readers in connection with animals and things about a farm. Children would learn by reading and at the same time study a little about the stock amongst whom many of them lived. I was told that very often the inspectors did not care about this sort of thing because it involved extra trouble, and therefore the schoolmasters were given a quiet hint sometimes that it might be advisable to drop it.

4882. In your opinion the teaching of agriculture in rural districts should be at evening classes?—I will not say that exactly, but I do not think you could bring it into the everyday teaching because that is very overburdened now. But lots of children would come for bee-keeping, and things like that, and very often those things are hobbies of the schoolmasters, who often take a keen interest in their boys, and they would be glad to give instruction in bee-keeping and poultry keeping and that sort of thing.

4883. You believe in nature study being encouraged in elementary schools?—Yes, particularly the power of observation.

4884. And that special classes for agricultural subjects and dairying might be held on Saturdays?—Yes. They are rather expensive, but I think they might be done fairly cheaply by people who have taken a diploma of a college. For instance, in my own case I held, I think it was one cheese class and about three or four courses in butter-making. I believe Mr. Brooke-Hunt came down on two or three occasions in connection with Bangor, and after that any student who wanted to come say from an intermediate school, coming to my farm, and going to the dairy who had passed the examination, would count.

4885. After he had obtained the diploma?—After he had obtained the diploma. They had to do a certain amount of practical work, and coming to my place would count for doing the practical work instead of going to college.

4886. After having obtained the National Diploma?—No, before; instruction was given to one girl from the intermediate school, but that is the only case.

4887. To what do you attribute that?—I could not tell you. They do not encourage agriculture much in the intermediate schools, I am afraid, in North Wales.

4888. You think that the intermediate schools in Wales might do more for agricultural training?—I think some of them would be very glad to do more. It has been suggested, at any rate, by our head-master—I am chairman of that intermediate school—that some of the smaller schools might specialise a little bit in agriculture, but at present there is nobody who takes it up at all.

4889. You do not think that it would be better to leave those intermediate schools to deal with general education alone. Do you suggest that they should have agricultural departments?—I suggest that they might be encouraged to hold evening classes again.

4890. Not during the day?—No, not during the day, they could not do that; their curriculum is quite overloaded as it is at present. I should use the buildings, and possibly the staff, giving them a little extra for it. They are quite keen about it, and I fancy they would care to do it if they were encouraged.

4891. You are acquainted with the work of the agricultural colleges, do you consider that that is quite satisfactory?—Yes; I think they have done a wonderful work, considering how they are handicapped for money. I know

the North Wales colleges and I know Reading, and I think they have done splendid work. I do not believe they know themselves really what good work they have done. That is my opinion. I have gone round—I have been asked to go instead of one of the lecturers and give a lecture to say 50 or 60 or 70 farmers, or a talk rather, and I have found out that they have been reading about these college experiments, and have been working them for themselves on the quiet, but they would not give themselves away. That is what makes me say that. They will not confess that they have taken any trouble about it, but I have found out in many cases that they are experimenting on their own.

4892. You are in favour of giving expansion to local lectures as much as possible?—I think that is the only means of stirring up enthusiasm. The success of a local lecture depends a great deal on the man who organises the lecture. If he is a good man and whips people up he will have a good audience, and if he is an indifferent man he will only have a poor audience, but still the lecturer has an opportunity of seeing the people who are there and so getting into touch with farmers in the district.

4893. The lecturer must give encouragement to the farmers to take part in a discussion which ought to follow the lecture?—Yes; they always do. They give very practical lectures, and then they ask people in the room to put any questions that they desire to put.

4894. You are of opinion that the Board of Agriculture should summarise and circulate widely the results obtained by experiments which are only circulated locally?—Yes.

4895. You think the Board of Agriculture should be a kind of clearing house, as it were, for all the experiments throughout the country?—That is so, exactly. I could not put it better than that. It would be most valuable. At present there are a lot of experiments of very much the same character conducted in the different centres, and if they were all done on pretty much the same lines you would have a very valuable set of statistics that you could look at and judge for yourself of their value.

4896. You think that the Board of Agriculture should circulate that information free?—Yes, I think they are the best body to undertake that. They now circulate pamphlets which are very valuable.

4897. Do you think the Board of Agriculture also should give the colleges some hints as to the experiments which are required, such as those on grass-land, so that the results can be compared?—What I mean is this: the Board of Agriculture gives grants to these different colleges, and their organisers might quite well say to the principal "Could not you arrange among yourselves to have one of two different experiments going on pretty well on the same lines?" and others, I have no doubt, would be only too glad to fall in with it.

4898. In order to co-ordinate the various experiments?—That is so, so as to avoid overlapping.

4899. Your experience is that the farmers take more interest in the research work?—Yes, that is my experience. Take, for instance, the Harper Adams Agricultural College, where I am; they send farmers every year over the farm; those people come and look at the experiments and criticise them, and the principal tells me that they are coming in increasing numbers every year. They are now amplifying the experiments. They have strips of oats, for instance, right across the field with the name written up large on a board, so that anyone going along the road in a motor or in a cart can see exactly what sort of oats are growing and can judge for himself of the condition.

4900. For what objects, in your opinion, is more money wanted?—Some of these colleges want more money for the staff. Some of the staff are rather under-paid, and the experimental work could be developed, and the equipment of the colleges. It is very difficult to thoroughly equip a college with specimens and all the chemical laboratory apparatus. I am only talking of the Harper Adams College, of course, because that is the college that I know, and they do very valuable experiments there in the way of testing seeds and so on. Farmers bring their seeds to have them tested now, and that is one kind of thing that more money is wanted for. Money is wanted to carry out work on those lines.

4901. In order to further extend the work of the college?—Yes. I do not think you could carry it on on any better lines than it is carried on now. The only thing is that you could amplify it. I think the country generally is getting more confidence in the colleges.

4902. As you point out, the Colonies and foreign countries

spend larger sums of money on agricultural education than are spent in England?—Yes, and not only that, but there is another thing that might be done. When I was connected with the dairy at the Royal—I was chairman for some years—I used to get in touch with people such as Valentine, the butter judge, who went abroad. He went to New Zealand, and got a handsome appointment there under Government, and in Australia, and if anyone was in trouble with their butter or their cheese they used to send and ask him to come and advise them what to do. I believe they carry out that system in the colleges in America and in Canada, so that if a farmer's butter is not quite as good as it might be, or if his cheese is not quite as good as he thinks it ought to be, he can get skilled advice; and in certain parts of England I should think that could easily be done at comparatively little extra expense.

4903. Is it your opinion that winter schools should be increased?—Yes, I think so, because the young people and children could not be spared much in the summer; they could be in the winter.

4904. Do you think farmers would be in favour of sending their sons to those classes in the winter?—Yes, to keep them out of mischief, for one thing. As it is, they send them to choirs and that sort of thing, and they sing—anything to keep them employed in the winter evenings—and I think they would send them, and that is why I think we should utilise the elementary schools; or better still, in the intermediate schools they have the plant, and could teach them the elements of chemistry; they have also a cookery plant in the intermediate schools, and they can teach them cookery, although perhaps that is rather travelling away from agriculture.

4905. You think they should be taught cookery?—Yes, anything like that for evening work, although that is not quite agriculture, and perhaps I ought not to have said that.

4906. You have been acquainted with the work that has been done at Studley Castle, have you not?—Yes, I was acquainted with the work; I was Lady Warwick's chairman at Reading at the start.

4907. Perhaps you will give the Committee some information with regard to the Studley Castle College?—Do you mean with regard to the school itself, or with regard to the whole work?

4908. The whole work.—Lady Warwick started this association for women at Reading. She took a hostel there which she had very nicely furnished for the pupils: there was a very nice garden, and there were greenhouses and so on. Then they took an additional garden and some cottages were built, and skilled instructors in horticulture were brought in and very good practical instruction was given in horticulture. They used to dig and prune and plant the seeds, and pretty well do all their own work. In addition to that they had poultry-keeping, and I believe also bee-keeping, but I am not quite sure about that. They were there at Reading for some time until they rather outgrew the place, and then they moved away to Studley Castle. I ought to say, by-the-by, that at Reading they started a small dairy under Miss La Motte. Miss Crooke taught horticulture there. At Studley Castle, where they have a very fine garden which the pupils keep themselves, and the whole thing is really very well done indeed, and really practical work and instruction are given to those ladies. They also have a very fair dairy there, and a girl if she wanted to, could learn enough to equip her to go out either to take up dairy work, or to manage a small place on her own in horticulture.

4909. Dairy work and horticulture are the chief subjects, are they?—And poultry-keeping.

4910. No agriculture?—I do not think so.

4911. All women?—All women, yes. Miss Bradley was the principal when I was there; I knew her from the start, but now she has gone to a place called Bredons Norton.

4912. It was all practical?—It was mostly practical, but there were lectures given.

4913. Were any lectures given in botany?—That was more at Reading, but I believe there were. I do not know who the instructor is now. I ought to say that Reading College worked hand in hand with Lady Warwick's institute at Reading, and they used to learn their dairy work at the British Dairy Institute first of all before Miss La Motte started. A lot of them were at the Institute.

4914. Was a certificate given at the end of the course?—I believe so, but I am not sure about that.

4915. How long used the course to be at Studley Castle

College?—I could not tell you, but they will be able to give you that information. I may say, in connection with the Hostel at Reading, that I had two ladies from there who made my butter and cheese and who were with me for four years, and they certainly were excellent.

4916. Your opinion is that Studley College is a good one?—An excellent one. I think it supplies a want. There are lots of ladies who have just a little money, and who, by getting that instruction at a place like Studley, are enabled to start on their own. Then, again, some ladies want to know about the management of gardens and poultry, and that sort of thing—independent ladies—and it supplies that want.

4917. (By Lord Moreton.) Will you tell us the objects the two national societies had in view when they started the examinations in agriculture and dairying?—To provide a practical examination for a diploma in agriculture and dairying in this country.

4918. Am I right in thinking that when you started there was rather an idea that there were so many examinations held in England and diplomas given that people could hardly tell the value of any particular examination?—I should hardly like to say that, but it was thought desirable to have a central Board of Examiners first of all and a central examination.

4919. Do you consider on the whole that the system has worked well?—As far as I know I think it has worked very well. We have an increasing number of students coming up to be examined, and another thing, and one which I attach far more importance to myself, is that the people are snapped up directly they have taken our diploma. I look upon the whole thing as of a monetary value, because, if people take our diploma, they are snapped up at once either by the colleges or by outsiders.

4920. Should you be willing to see the whole work taken over by the Board of Agriculture, and an advisory or consultative committee appointed, representing all the various bodies?—Yes, that is just what the Society have wished from the start. They only stepped in because they did not wish to see the good work dropped.

4921. Do you think it would be feasible to make any change in the present form of agricultural examination so as to give it a more definitely practical shape?—Yes; of course the ideal thing is to have it on a farm, and to take the students out with you walking, and you can do the whole thing at once; you could do practical agriculture and botany and everything else as you are walking round.

4922. Do you think more students would present themselves for examination if the examinations could be held in a large number of centres?—That I could not tell you, I have no idea about that, but it would very likely be a stiffer examination.

4923. You mentioned the Royal Agricultural Society's text-book a short time ago. Besides a text-book they have also from time to time published various diagrams, have they not?—Yes, by Miss Ormerod and others—very valuable ones.

4924. Some of those diagrams have been produced in a form in which they can be used, and have been largely used, in elementary schools in the country?—Yes.

4925. Also at present I think the same diagrams and illustrations of the stock in the text-book can be bought in the form of magic-lantern slides?—Yes, at Newman's.

4926. With regard to the Forestry shows that have been held by your Society, until this year there has been no idea of competition at them, has there—it has been more in the way of exhibition merely?—That is all.

4927. This year the Royal Agricultural Society is instituting a new departure in the shape of competitions for which medals are to be awarded?—That is so.

4928. There is one point you may have omitted as regards the educational work of the Society, and that is the farriery work has been done at the various shows?—Yes, I ought to have mentioned that. There is a forge set up there, and we give prizes for shoeing. At each show we have a competition both for heavy horses and for light horses. That is part of the show.

4929. That is done partly under the auspices of the Farriers' Company?—That is so.

4930. (By Dr. Somerville.) Of course, as you know, notwithstanding the fact that the number of candidates for the diploma has grown, there has been a talk of reform in the air?—Yes, for a long time.

4931. Rather in the direction, I think, of making the examinations more practical?—Yes.

Mr. J. M.
Dugdale.
29 May, 1907

Mr. J. M.
Dugdale.
29 May, 1907.

4932. Have you considered whether it would be desirable to cease to examine candidates in the fundamental sciences, and rather for two practical bodies like the Highland and Agricultural Society of Scotland and the Royal Agricultural Society of England to confine themselves to examining candidates in the applied sciences and in the practice of agriculture?—No, I have not thought about that. The idea has been that the Board of Agriculture would at some time or other take it over, and they would go on their own lines and get their own advisers. We have gone on the old line for years. Of course we have tried to make it as practical as we know how to.

4933. There are serious difficulties in the way of making it more practical, of course, but you would, at any rate, have more time for the examinations, and would consequently have more space at your disposal if you accepted some exempting certificate as regards chemistry, botany, and physics?—I see no objection to that. All we want to do is to carry out the wishes of the colleges if we can get them to agree. The only difficulty that I see is this, whether all the certificates of the different colleges would be considered by the colleges themselves as equal.

4934. That would be a matter no doubt for a joint Board to determine?—A joint Board, or representatives of the colleges themselves. The criticisms we have, come from the different colleges; we are only too glad to take any suggestion.

4935. You are altogether in favour of joint experiments?—I think so—I mean to say I think it would be very valuable to people like myself, for instance, to have the results of what the different colleges are doing.

4936. You are rather thinking of the distribution of the information gained?—That is it.

4937. As a matter of fact, the Board of Agriculture are taking steps in that direction, and, I believe, propose issuing a summary of the results that have been obtained with all the mangold experiments conducted throughout this country during the last 20 years. You are also in favour of some systematisation of the work that is carried out by the various centres in the way of experiments?—That is not from my own brain—I mean to say it has been suggested that it might be a good thing if it was brought into a system—the size of the plots, for instance.

4938. And the object?—And the object.

4939. I suppose evidence becomes much more convincing when it is cumulative?—Certainly, I think so.

4940. A single isolated result is scarcely, in many cases, reliable, but if you have some result repeated under varying conditions of soil and climate and over a series of years, it is more conclusive?—Yes. Take clover, for instance. Farmers will do it, but a man cannot grow clover every year, and consequently, at times, it is a great failure. But if you can show, by collecting the results of experiments all over the country that they all fail, the farmer will then listen, but otherwise he is very pig-headed.

4941. Have you seen this book issued by the Board of Agriculture entitled "Manurial and other Agricultural Experiments," and which contains draft schemes for experimentalisation on co-operative lines?—No, I have not.

4942. There was a scheme that was prepared by the Agricultural Education Association that you no doubt know about?—Yes.

4943. And which was submitted in 1903 by the Secretary, Mr. Dymond, and in his covering letter, he says, amongst other things: "At this meeting I was instructed to submit the schemes to the Board of Agriculture and to request, in order to secure their widespread adoption throughout the country, that the Board would print and publish them." The Board did print and publish them, with an introductory memorandum, and they are the drafts, as I have said, of every conceivable demonstration, and it is issued by the Board with the desire of systematising the work. You, yourself, have not come across this?—No, and I have not heard it talked about, either.

4944. Just one word about the position of women in agriculture and horticulture. Do you know of any who have made a practical success of a small holding, either in the direction of horticulture, or poultry keeping, or agriculture?—I do not know, from my own knowledge, but I have heard of people. There is a lady near Dublin who has taken a dairy farm and who is doing very well indeed, and I know another girl, near Ellesmere, who has also done very well—a well-known girl.

4945. Has she done well?—I believe so.

4946. Do you know, as a matter of fact, that she has abandoned her holding.

4947. (By Mr. Medd.) That was agriculture?—Agriculture and dairying. She had a shop in connection with it.

4948. (By Dr. Somerville.) As you know, however, that lady is a great authority on small holdings?—Yes.

4949. (By Mr. Medd.) Do the Royal Agricultural Society still make grants to the Veterinary College?—Yes, a reduced grant.

4950. I would like to know, if you can kindly tell me, the amount of subsidies you now give to education work. Do you subsidise the Veterinary College?—Yes.

4951. If you have not the figures, you might send them after, if you would kindly. Will you kindly supply me, so far as you can, with the amounts that have been contributed to the Royal Veterinary College, the Woburn experimental station, and the Rothamsted?—Yes.*

4952. You have contributed a very large sum for educational purposes?—Yes, in days gone by.

4953. That has been done quite voluntarily?—Yes.

4954. You referred in your evidence to the very large sums given by the State in other countries for educational purposes?—That is so.

4955. The Royal Agricultural Society have been voluntarily undertaking what has been conceived elsewhere to be the duty of the State?—Yes, but others as well—the Bath and West, for instance—have given money.

4956. Yes, we have had evidence from them. With regard to Wales, I think there is a slight inaccuracy in that map, is there not. Radnorshire is now affiliated to Aberystwyth—it has been for the last two years?—That I could not tell you.

4957. Well, it is, as a matter of fact, and it ought to be coloured green. Every county in Wales is affiliated to some collegiate centre for agricultural purposes?—Yes.

4958. That is a consolidated area, so to speak?—Yes. As you ask me that, I must say that the present boundary between Aberystwyth and Bangor is very inconvenient. There is a railway called the Cambrian that goes straight through from Aberystwyth to Whitechurch, which makes it very convenient for persons residing in this part of North Wales to get to Aberystwyth. If we want to go to a meeting, for example, at Bangor, it takes us half a day to get there, and it is very inconvenient for lecturers, and I venture to suggest that it might be a good thing if the Board of Agriculture could approach the two University Colleges and give some of Merionethshire, which abuts right on to Denbigh, to Bangor and take the line above Montgomeryshire a little bit up and bring the line under Denbigh a little bit down. I think that would be very valuable for working purposes, and, I think, it would save a good deal of money.

4959. The northern half of Merionethshire would go to Bangor, and the southern half of Denbigh to Aberystwyth?—That is what I should suggest. There is a range of mountains there called the Berwyn mountains, which forms, practically, a barrier, and the Cambrian railway runs right along, and I do not think it will be taking much away from Bangor if what I suggest can be done.

4960. Do you think it would facilitate the agricultural education of Wales if schemes were annually submitted by Aberystwyth and Bangor to the Board of Agriculture for advice and suggestions to indicate the agricultural education from the elementary school up to the collegiate school?—I did not say that: I said experiments.

4961. With regard to agricultural education itself, there is a gap in Wales, I imagine. You do comparatively little for the son of the small farmer in the way of intermediate education?—That is so.

4962. Do you not think that it would facilitate the filling up of those gaps and prevent overlapping in individual counties if these collegiate centres devised schemes to cover the whole area affiliated to them and submitted those schemes to the Board of Agriculture just for suggestions and advice?—At the present time the colleges give short courses to the sons of farmers, and some very respectable young fellows go there; but it is found in practice, when the student gets there, he knows little or nothing about chemistry, and so they have to begin from the very beginning, whereas, as I suggested to the chairman, if it be possible to give even the most elementary teaching in the intermediate school during the winter months, or at evening classes, then I think it would be a tremendous help

* A statement subsequently received showed that the average annual cost to the R.A.S.E., from 1896 to 1906, of the examinations for the National Diplomas was: Dairying £135, and Agriculture £234; the grants to the Royal Veterinary College, from 1897 to 1907 inclusive, amounted to £4,750; and the cost of the Society's Journal and other publications during the years 1897 to 1906 inclusive was £16,324.

to those boys, who would know something about the various subjects, when they go in for the short courses at the Universities.

4963. Yes, of course I am thinking how the work could be better systematised, so that there should be no gaps in particular areas, and these collegiate centres should be in fact more or less responsible for the education of all the areas connected with them. That is my idea.—I do not see anything against it. I think if it could be done it would be a very good thing.

4964. It has been mentioned here, and some witnesses have approved it, the idea of having a permanent consultative or advisory committee in London composed of representatives from the different counties and different agricultural societies to confer with the Board of Agriculture, and to bring the views of agriculturists before the Board, and bring pressure upon the Board and the Government on their behalf. Do you think that would be a useful thing?—Yes, if you can get the people to attend.

4965. That question of attendance has been raised here, and it has been said that those delegates who attend the Chamber of Agriculture meetings in London most regularly happen to be delegates from the counties of Northumberland and Cumberland, so that the difficulty of attendance may be put upon one side. Now, with regard to literature, you do not get anything from the Board of Agriculture unless you apply for it?—Yes, I do. They send me the new pamphlets from time to time, and I circulate them, although, as a matter of fact, I have not seen that one that Professor Somerville referred to, but I do get pamphlets sent to me from time to time.

4966. Sir Thomas Acland suggested that it would facilitate distribution if the Board of Agriculture were to send copies of their pamphlets to the village post offices throughout the kingdom for distribution?—I am afraid they would not distribute them; I do not think they would take the trouble unless they were paid for it.

4967. The trouble is that it is extremely difficult for the ordinary farmer to obtain literature to-day. If he does not apply for it he will not receive it, and we have the fact that neither you nor Sir Thomas Acland, both of you most prominent men, have even heard of this pamphlet, so that there must be something defective in the system of distribution. Can you suggest any better way of distributing the Board of Agriculture literature?—No, I do not think I can. I always took it that I got my pamphlet because I was connected with the Royal Agricultural Society.

4968. I imagine you at some time or other applied for them, and said, "Please send me so and so," and so your name got upon the list?—Very likely.

4969. But if a man does not apply he will not get them. The consequence is that the literature only goes to the converted people, and the unconverted people, to whom it is most desirable it should go, never get them at all or see them?—I believe there are certain people appointed in the counties as Correspondents for the Board of Agriculture. I do not know whether they do correspond, but if they do, those people might undertake the distribution of the literature.

4970. Have you personally come in contact with any Correspondents?—No, I have not.

4971. Have you found the Correspondents of any benefit to you agriculturally in your neighbourhood?—We get these statistics. For instance, I take the *Journal of the Board of Agriculture*, and I presume they send the statistics there. I find that *Journal* very useful.

4972. It has been mentioned here that possibly a consultative or advisory committee in London would be more practically useful than the system of isolated Correspondents. It would bring all the representative people into touch one with the other, so that one part of England could learn what the other part of England was doing, and so on. With regard to the intermediate schools in Wales, you do not suggest that any attempt should be made to teach agriculture at the schools?—It is in the syllabus, but they do not teach it; they only take a few subjects. The children do not stop long enough; of course some stop longer than others, but they do not remain long.

4973. You take them up to the age of 16 or 17?—Yes, I think so.

4974. What you would prefer, I imagine, is instruction bearing upon rural subjects rather than upon agriculture itself?—Yes, rural subjects—botany and things like that.

4975. Nature study?—Nature study.

4976. Subjects which will develop intelligence and arouse interest in rural life?—That is it.

4977. You would have it taught educationally rather than technically? You would not advocate its being taught with special technical reference to either agriculture or farming?—No, I do not think so.

4978. With regard to the training of the teachers, I notice in Wales that practically is done?—That is so.

4979. It would be possible, would it not, at these collegiate centres to have regular courses?—It would, but the only thing is, it means more money. I have had experience of that. A great friend of mine, the head of the Harper Adams College, gave them in his vacations, and the consequence was that he got knocked up. In my opinion you ought to have a staff specially paid for that individual work, and not make the Principal, who has been working hard all the term, do it in his vacations.

4980. That would be one object for which additional funds are required?—That is so. These people are working all ends up, and have no time to spare, and well deserve their holidays.

4981. With regard to that question of more funds, you are interested in agriculture generally, and more funds are wanted, are they not, to enable those blank spaces on the map to have some form of agricultural education?—Yes.

4982. I live in Gloucestershire, and all our area has nothing—from Warwickshire down to Cornwall there is nothing?—In Monmouth they have quite a good dairy work going on. The Director of Agricultural Education in Monmouthshire, is doing quite good dairy work, and I must say I thought the County Council in Worcestershire was also doing good dairy work.

4983. I think it is only in horticulture. The difficulty is that the Board of Agriculture only takes cognisance of what it subsidises?—That is a different thing. On page 168 of the Report for Worcestershire you will see "Dairying, Poultry-keeping and Bee-keeping." I know they are pretty keen, because Mr. Wheeler, a man I know very well, a great fruit man, is taking great interest in it.

4984. The instruction in Worcestershire and these other counties is all what one may call spasmodic, is it not?—It is annual, is it not?

4985. It moves about from place to place. There is nothing in the nature of a permanent institution?—That is so.

4986. Money would be required for that, and then also you would agree that money is wanted to promote intermediate education, that is to say, for the son of a small farmer, the man who cannot send his son to a collegiate centre?—Yes. In Wales, as I say, we have got them, but they will not take them up.

4987. Those are for general education, and I was referring to purely agricultural instruction?—Then I say with the present staff of the intermediate schools you could not teach them except at evening classes.

4988. I was rather thinking of permanent winter schools. You told Lord Reay that you approved of that idea?—That is on winter evenings.

4989. Not winter day schools?—The schools are all filled up; there are no buildings available.

4990. That is why we want money to provide them?—If you can provide them, by all manner of means.

4991. To-day the son of the small farmer has no opportunity whatever for continuous instruction. Many good lads could afford to go during the winter for perhaps fifteen or twenty weeks, up to the age of eighteen. They do it in Ireland, and they do it a little bit in parts of England. Have you thought whether the Board of Agriculture should provide funds to promote or to subsidise agricultural co-operative societies?—No, I have not thought about that. I have read a good deal about co-operation, and I thoroughly believe, in my heart of hearts, that that is the thing; but there are two sides to that question, you know. Co-operation, of course would smash a great many small village tradesmen. There has been formed near the Harper Adams College a new co-operative branch, with which a brother of mine is connected and most interested in; but they can undersell the local man, who has perhaps been supplying the district for many years, and certainly those people would cease to get any livelihood if co-operation was instituted.

4992. The farmer, as an individual, can generally rely upon a profit by adopting co-operative methods, which he could not obtain by selling his produce individually?—I do not think the farmer would care to sell his produce so much by co-operation. I think he would buy through

Mr. J. M.
Dugdale.
29 May, 1907.

Mr. J. M.
Dugdale.
29 May, 1907.

that means, but, like everybody else, he likes to bargain. Everybody else loves a bargain, and he, I think, prefers to sell his produce himself.

4993. The question is, do you think the Board of Agriculture would be justified in subsidising co-operative societies?—I have no idea of that. I think co-operative societies for buying are all right, but I doubt whether co-operative societies for selling would do.

4994. Earl Carrington, in a very important letter on that subject which he wrote last year, said that if times were better he would invite the Government to put him in possession of funds to subsidise co-operative societies?—In answer to that, you get the answer at once: co-operative societies against the local trader, and why drive the local trader out of existence? That would be the answer at once.

4995. Do you think the inspectors of the Board of Education might show a little sympathy towards rural and agricultural schools?—I think they could do everything. If they would like it done, they could induce schoolmasters to encourage their pupils, by means of little gardens and bee-keeping, and in a way by small poultry-keeping, and so on.

4996. As to Studley, the lady whom Prof. Somerville referred to in the north failed in agriculture rather than horticulture?—Yes.

4997. You have found that ladies trained in horticulture and dairying at Studley have succeeded?—Yes. A friend of mine had a lady gardener, and she succeeded very well.

4998. (*By Prof. Somerville.*) Did she fairly fit into the establishment, because that is the difficulty?—She only had a man under her. She did all the garden work, except the actual hard work of digging and wheeling, and I have been told she was a great success.

4999. The difficulty is to know what to do with them. I have been told they will not go into the kitchen, and they cannot be fitted into the drawing room?—Yes, that is just the difficulty, and that is why it is so different in this country from what it is abroad. The moment people go abroad they will take off their hats and coats, and are not ashamed to do it, and set to work. That is the reason why so many of them go abroad.

5000. (*By Lord Moreton.*) I believe I am right in thinking that, besides the publication of the Journal, which we may look upon as an educational work, from time to time the valuable articles that appear in the Journal, and which are written by eminent authorities, are reprinted and circulated so that they may get into the hands of the members of the public at a very moderate cost?—That is so.

5001. (*By Mr. Davies.*) With regard to the work which is done by the Royal Agricultural Society, I understand you subsidise different colleges?—No, not colleges. It is the Board of Agriculture who do that; we only give so much towards the Royal Veterinary College; I do not know what else we give besides.

5002. What other function does the Agricultural Society fulfil? You had at one time a large chemical department, had you not?—Yes, and we have yet, and anybody can now send samples of all sorts of things to be tested; but the work is now done a great deal by the different county councils themselves.

5003. So that your scope there for useful work has more or less been taken over by other people?—Yes, a good deal.

5004. With regard to the Board of Examiners, are the different colleges represented on that Board?—No, not the different ones. The Board of Agriculture have one representative, and the others are connected with the Royal Agricultural and the Highland Societies.

5005. So that really the professors, the staff at the colleges themselves, had no say in the examination papers which were drawn up for the examinations?—No, not at all. They had a syllabus sent to them, and they were originally consulted, a good many of them, about the syllabus itself, and once the syllabus is drawn, all you want is a good practical examiner.

5006. Do you not think it would be better if the colleges were represented on the Examination Board, and had more to do with setting the papers?—No, I do not think that would work in practice, I think that would be too big. You must trust somebody. There are skilled officials at the Board of Agriculture, and of course there are certainly scientific people connected with the Royal and the Highland.

5007. I know that some of the agricultural departments in the colleges have been very dissatisfied with the results of their students at the examinations?—Very likely.

5008. And they rather blamed the Board of Examiners than their students?—Yes, but sometimes they are wrong, you know.

5009. Mr Medd asked you about a consultative committee being appointed with a view to co-ordinating the different experiments. Do you think that is practicable?—I think the Board of Agriculture could quite well do that themselves; they are absolutely in touch with the different colleges, and they could absolutely do it without consulting anybody. They are in active touch with them day by day. It might be a good thing, but what is everybody's business is nobody's business, and I would rather myself leave it to the Board of Agriculture.

5010. Have you any opinion as to how the leaflets and information should be distributed which is now collected by the Board of Agriculture?—No, not after what I have heard. The same difficulty occurs with other things as well as this, to know how best to do it—with pamphlets of every sort or kind.

5011. With regard to the sphere in which Aberystwyth and Bangor colleges operate, in your opinion Montgomeryshire should be wholly affiliated to the agricultural department at Aberystwyth?—Yes, in my opinion certainly I think it should be divided and a certain part of Merionethshire given in exchange. I think at a round table it could be done quite easily.

5012. There is a committee appointed by the county council?—Yes, but I do not think it does very much.

5013. Some scholarships have been given for short course students who have gone up to the colleges?—Yes.

5014. Do you think these scholarships have been a success?—Yes, I think so. I know a young fellow on the adjoining farm to me, an excellent young chap, and he has been there.

5015. Is it not the fact that a good many of those scholarships have not even been applied for?—Yes, the good of these people going down and giving local lectures is that they stir up enthusiasm; and people have to be shown that they can get an advantage by education. A man will not go and spend his time unless he can see that there is money in it.

5016. Does it not really come to this, that the sons of farmers who could have afforded to send their boys to the agricultural colleges have really had to be paid in order to send them? They would not send them without these scholarships?—It is the same question, whether it pays to devote the time to learning. If learning is any use and will bring them money in, then they will go and learn, but if they think otherwise then they will not go.

5017. Is there not a possibility that the scholarships do more harm than good, in this way, that the small farmer who cannot afford to pay sees other men's sons who can afford to pay, getting their instruction for nothing and they take less interest perhaps in the work for that reason?—I should not like to say that. I think means could be found for paying the smaller men if they want it.

5018. Do you think a circulating agricultural library would be any use to small farmers?—No. You see, nowadays there is a very able article, as a rule, written, and very well too, in each of the local papers, and the farmers read that. It is a very good little article, about a couple of columns, in all the Montgomeryshire papers—they are published not very far from you—and they are quite readable.

5019. Supposing each college had a big library and they were able to circulate agricultural text-books to any farmer who wanted them, what would be your opinion as to the value of that?—It would be a very good thing if they could do so.

5020. I understand with regard to the intermediate schools, you do not think they ought to teach any definite agricultural education?—Not unless it is a definite agricultural school. I do not see how they could do so, because so many people are going in for so many different things. They would have to specialise, and the staff is too small and could not stand the extra work.

5021. Do you not think they might do something in the way of dividing the school into a modern side and a technical side, and teach chemistry and botany, and so on?—Chemistry is taught; I do not know whether botany is.

5022. With a view of fitting those young farmers for

higher agricultural education?—It is only elementary chemistry that is taught, and it would only be as an adjunct, to fit them to go into the agricultural college.

5023. (*By Lord Moreton.*) From time to time the National Diploma Board have taken counsel with representatives of the association of agricultural teachers, have they not?—Yes.

5024. And may I put it to you that we can never hope to draw up a syllabus or to fix upon a date for examinations which would suit all the various colleges and centres?—No, certainly not. I do not think we could; it is very difficult; it all depends on their different terms.

5025. Do you think if examinations were held, as I suggested to you a little time ago, at various centres, that that difficulty might possibly be got over?—I am not an examination expert; I am merely an organiser.

5026. You have had very considerable knowledge and experience of that subject?—Of course, if you did away with the chemistry work and the botanical, it could be done at any time; the examiners could go round at any time.

5027. (*By the Chairman.*) Can you give us any suggestion with regard to these Correspondents of the Board of Agriculture? Could they not be made more useful than they are?—I do not exactly know what they do, to tell the

truth. They are supposed to send up statistics, but I do not know how it works. It is rather a tie to do things of that sort. The way the agricultural papers do it is this; they send a form to myself and to other people to fill up as to the lambing and as to the weather and that sort of thing, and so collect the information.

5028. Do you think this system of correspondents might be made a very useful one?—Certainly,

5029. With a view of spreading information?—Yes. Of course other people or land agents might be got who would distribute the literature among the tenants; I think that might be done.

5030. You do not meet the Correspondents of the Board of Agriculture at farmers' clubs or meetings, do you?—No. You see, I am too busy, and I do not often go to those meetings or to the farmers' clubs—only the shows.

5031. Then as a matter of fact you do not meet the Correspondents?—No. I should think a good active bailiff or an agent who goes to market would be the best sort of people to take up that work.

5032. People who are in touch with the farmers?—That is so.

5033. There are a number of suitable men in the country?—Yes.

Mr. J. M.
Dugdale.
29 May. 1907.

Mr. WALTER E. COLLINGE, M.Sc., called and examined.

5034. (*By the Chairman.*) You are the Head of the Department of Economic Zoology at the University of Birmingham?—That is so.

5035. You are prepared to give the Committee a brief account of the work done from 1899 to 1906, which led up to the formation of a Department of Economic Zoology in that University?—Yes. The work that was done in economic zoology, prior to the foundation of this department, was done whilst I was Lecturer on Zoology and Comparative Anatomy at the University of Birmingham. It commenced in 1899 and was, practically, done in spare time. My method was to go and meet the farmers, particularly so on market days, in the counties of Warwick, Worcester and Stafford, and just on the borders of Shropshire and Gloucestershire. Worcester, Warwick and Stafford were the three main counties. In that way I became acquainted with a large number of farmers and fruit growers, who at first rather resented any interference or any advice with regard to pests in orchards or to parasites of cattle or anything in that way, but little by little, when they found there was no charge made and they had nothing to pay for the advice, and that they possibly profited by the advice, they became more and more amenable to meeting me from time to time, and we got on very well. The method I at first tried was to go to the different towns on a market day and, either by an introduction from some friend or from some local farmer, I used to get to know one or two of the farmers and then to cultivate the farmers in that particular district from time to time. This work grew, and in the year 1903 there were 189 actual inquiries made by post from these different farmers; in 1904 there were 325; and in 1905, 479. This, I think, shows that they appreciated the work, and it also, I think, is some evidence that there was need for that class of work in that particular district. In 1906 that was the last year before the foundation of this department which I preside over, the number of enquiries rose to 1,171, and this year they will probably exceed that number by two or three hundred, I think. The University saw that there was a need for this class of work, and they established the Department of Economic Zoology. In connection with that department they have also established an Advisory Board. The recommendation from the Senate was as follows: "That an Advisory Board be established to consult with the University on questions relating to the Department of Economic Zoology; to make suggestions as to its enlargement and development, and, as to the future policy of the University, with regard to agriculture and allied subjects, the Board to report to the Faculty of Science, Senate, and Council." That Board has now been formed and consists of representatives of seven Midland county councils, and a number of agriculturists have been co-opted and certain University officials. The Department of Economic Zoology at present consists only of myself and an assistant, but there is a recommendation coming before the Council

for the appointment of an economic mycologist, an assistant zoologist and a typist. The department has sent out cards of this description to the different farmers. (*Handing in cards.*) We ask them to fill them up and return them to the department, and we then place them upon a register, and in that way we know the particular crops that the farmer is interested in, or the particular stock, and we furnish him, from time to time, with circulars, bulletins and other literature. The scope of the work which the Department is at present carrying out is as follows: (1) The answering of enquiries from farmers, fruit-growers, gardeners, &c., as to preventive and remedial treatment for diseases of plants due to the depredations of animals or fungi, and diseases of live stock due to animal parasites. (2) The identification of common farm pests. (3) The carrying out of experiments as to the value of different insecticides and fungicides. (4) The carrying out of investigations upon the life histories of various insects, &c., hitherto not known or only imperfectly so. (5) Lecturing before different agricultural and horticultural societies, fruit-growers' organisations, chambers of agriculture, &c., and a short course of lectures at the University for gardeners. (6) Conferring with and advising agricultural committees of various bodies upon subjects relating to economic biology. (7) Inspecting orchards and farm crops attacked by different pests. (8) The publication of the results of experiments in the form of circulars or reports, or of other information for which there appears a demand. The number of reports, circulars, &c., which have been published and issued, in addition to a large number circulated by the Board of Agriculture and Fisheries, in 1903 was 1,000; in 1904, 1,500 were distributed; in 1905, 1,200 were distributed; and in 1906, 3,000. I have copies here of the various publications which have been sent out from the Department. To facilitate the work above mentioned it is necessary that the following matters be kept up to date, and this has been largely carried out: (1) The preparation of a card catalogue register of the farmers, fruit-growers, &c., of the Midland Counties, giving their names, addresses, and the particular crops, &c., they are interested in, or the different kinds of live stock. (2) The bringing together and preparation of a collection of the different pests, or of examples of their depredations. (3) The bringing together and preparation of systematic collections illustrative of animals beneficial or injurious to the farmer, fruit-grower, stock-breeder, gardener, &c. (3) On these lines the work is increasing monthly, and now more than fully occupies the present staff. (4) There is a pressing need and a wide field for work in all the sides taken up, viz., injurious and beneficial animals, animal diseases, and economic mycology. The extent to which such work can be carried out in the future depends almost entirely on the strength of the staff, the financial means, and the amount of accommodation the University can provide. I have laid my views before the Principal of the University and

Mr. W. E.
Collin.

5035d

5035e

5035f

Mr. W. E.
Collinge.

29 May, 1907.

others—of course, they do not in any way implicate them, but I believe they will be more or less followed. For the future development of the Department, and for the future development of agricultural education in the University, I have suggested, and it has been considered, as I have stated, the appointment of a general clerk, an assistant mycologist, and an assistant zoologist. I hope they will obtain an experimental farm and group their agricultural department round that farm, the laboratories, a library, and a museum. No teaching work, I believe, will be done, unless it is teaching work of a much higher nature than that given at any of the county council schools or the colleges in the Midland Counties; that is to say, it will be a course leading to a science degree in agriculture for agricultural students. The work, I hope, will be mainly on the biological side, embracing plant and animal diseases, plant and animal breeding, the breeding of new varieties, the establishing of the purity of breed, the application of Mendel's law to agriculture, and the biology of the soil.

5036. Mainly research work?—Research, experimental, and consultative. Wherever possible, I think the work would be of a biological kind. Of course, I presume the University will provide also a department in which the chemical side will be taken up. But it seems to me from the experience I have had during the last nine or ten years at the biological side in this country, both from the teaching, the research and the experimental point of view, as been woefully neglected, and it is the side, I think, from which the farmer and the stock breeder is most likely to gain. I have endeavoured, therefore, to use any weight I have, and the weight of others, with the Council of the University to keep before them the biological side rather than the chemical and the manurial side. No elementary teaching in any sense will be undertaken. I think the Council are agreed on that, and I do not think they will attempt it in any way whatever. The present department is not situated in the actual University; it occupies a separate building, consisting of a clerk's office, a research laboratory, a small museum—more a storage museum rather than for show purposes—and a consulting room, which also serves the purpose of a library. I have placed in the library for the time being 3,000 works of my own, which the University has the use of. I may say that the expense to the University at the present time is about £400 for the upkeep of this department, and the University have no funds which they can spend upon agricultural research or experiments. Of that £400, £50 is guaranteed for three years by Sir John Brunner.

5037. Do you obtain any grant from the Board of Agriculture?—No, we have no grant.

5038. Have you any grant from the county councils?—No, not as yet, but we are asking grants from Stafford, Warwickshire, Worcester, Leicester, Shropshire, Herefordshire, and Derby. We are asking them each for a grant. We have their representatives on the Advisory Board for Agriculture, and we have asked them to bring the matter before their respective councils.

5039. Is there a prospect of obtaining those?—I do not think we shall get them immediately from more than three, that is Worcester, Warwick, and Stafford.

5040. Have you any students at the University who attend in the laboratory?—No.

5041. Do you give any lectures?—Not of a teaching nature; they are lectures more for the giving of advice to the farmers and fruit-growers at the different chambers of agriculture, etc.

5042. There is no regular course of lectures?—No regular course of lectures.

5043. Your position is principally consultative?—Yes.

5044. And you carry on research?—Yes.

5045. Your opinion is that biology has been very much neglected?—I think very much so.

5046. As compared with what is done in Germany and other countries?—Yes, America particularly.

5047. You have also applied to the Board of Agriculture, I am informed, for a grant?—We have applied—the Principal of the University applied—but they did not think the time was opportune, and I think Sir Thomas Elliott said that there was no possibility at that time of any grant being made.

5048. From what you have stated, and from these cards that you have handed in to us that you send out, and the answers that you have received, that part of your work seems to have been very satisfactory?—Yes. These cards were issued at the end of October, and we have had something like 600 of them returned. Of course, previous

to that I had on the register the names of a large number of farmers, I think altogether about one to two thousand.

5049. You are yourself constantly going to these various counties whenever your advice is asked for?—Yes, and if there were further assistants in the Department I could spend more time in that way.

5050. If you had more assistance in your Department at Birmingham you would spend more time on those excursions?—Yes.

5051. You think that is the most useful part of your work?—Undoubtedly. Speaking for the Midland farmer, he has very little faith in anybody who will not come, to use a local phrase, “and plant his feet on the soil”—that is what he likes.

5052. You are of opinion that, in order to stimulate the desire for agricultural education among the farmers themselves, that is one of the best means that can be applied?—I think so.

5053. The result of your visit is also to make them realise that they should send their sons to the colleges?—Yes. I should explain, supposing I received a request to go to Herefordshire, or Worcester, or Warwick, after going down and telling the fruit-grower what he had best do, I then send in a typed report so that he may have it for future reference. We send that off the same evening or the first thing next morning.

5054. All the results of your enquiries are collected and printed?—Yes.

5055. Those are printed by the University, are they?—No, I pay the cost of the printing. From 1899 up to the present date I have spent some £690 on the cost of printing and distribution of reports, and of course prior to the foundation of this Department on travelling expenses.

5056. All this expense fell upon you?—Entirely.

5057. You did that from a philanthropic motive?—Simply because of my interest in the subject. Of course no funds could be allotted to a department which did not exist.

5058. Of course it would be desirable to have some funds allotted for that purpose?—Certainly. I have made representations to the University, and that will have to come about if the publications are to continue.

5059. I understand from your evidence that the University contemplate the formation of an agricultural department?—In the future.

5060. It is only the want of funds that has prevented that?—Yes.

5061. What is the College at present to which the farmers in those counties that you have mentioned send their sons?—There is the College at Kingston, Derby. There is another in Shropshire, the Harper Adams Agricultural College, and there is, of course, the one at Cirencester in Gloucester, but Gloucester is not in our area now. I included Gloucester for some years, and worked Gloucestershire very well, but Bristol University made representations and said they would prefer to take Gloucester for the scheme they are at present considering, and so we dropped Gloucester, so that there are really only two colleges—the Harper Adams in Shropshire, and the one at Kingston, Derby.

5062. It would be of value to the Committee if you were to give the Committee your views as to the organisation of such an agricultural department as you have intimated. I dare say you have considered that subject?—I should organise it purely or very largely from the biological side. I should undertake for the farmer experiments on the crossing and breeding of plants and different fruits and the application of Mendel's law for the purity in strain both for the different breeds of cattle and sheep and fowls and so on, and I should also continue the experiments on insecticides and fungicides for diseases of plants, both those attacked by fungi and those attacked by animals, and I should also, in the event of such a department being founded, open up negotiations with the different County Councils so that they might from time to time send the best of their students to such an institution and remain there. On the presumption that the County Councils are giving a grant to the University for the maintenance of such an agricultural department, I should admit such students either at a very low fee or practically free and ask the Councils to defray their travelling expenses and pay the cost of their board in the district. I should like those students to remain in the institution say for two or three weeks—not a long course, but a short course—and let them go day by day through a course of seeing the experiments as they are carried out, and certain explanations

would be given them, and also printed details of the experiments, and they would be allowed to take notes, so that supposing they were going to become, say, the better class farmers, they would set an example to the smaller class farmers, and they would also know the lines of the experiments and the work carried out by such an institution and could disseminate such information.

5063. Such students should have a carefully laid foundation in pure science, I suppose?—Yes, I take it that the County Councils would only invite the very best students.

5064a. Your idea is that an agricultural student should be a student of a high educational class?—Yes, agriculture is a deep study, and you want on the land, just as in any other calling in life, a man of brain, and if you do not put that man on the land agriculture will not be a success in this country. Therefore you must give the man exactly the same standard of education as you would do supposing you were going to turn him out as a medical man, a lawyer or an engineer. That I do not think has been done in this country. The agricultural instruction, so far as I can see, that has been given in this country is of a very poor nature indeed; in fact, I should not hesitate to say that in some of the agricultural colleges in this country the instructor is only a page in front of the student, and very much of the experimental work that is being done is, I think, useless and quite valueless so far as the farmer is concerned, because the men who are working these experiments have not the training necessary for the proper carrying out of such scientific experiments. The manuring experiments and so on that are being carried out now have no bearing on other parts of the country and only apply locally, and when the report is published of them no information is given as to the analysis of the soil so that a farmer can have his own soil analysed and compare the result, say in Wales or the north of England, with the condition in the midland counties.

5065. Therefore your view is that the Board of Agriculture might do a very useful work in drawing up a scheme in regard to such experiments as you describe and as to how they should be carried out, and that the Board of Agriculture should consult you and those like yourself who are moving in that direction?—Yes, I think so. I think, before these colleges carry out experiments, the experiments should really be mapped out for them and they should know upon what lines they are to work.

5066. Your view is that the experiments which are now carried out by the various colleges throughout the country are not on a sound basis?—That is so, with one or two exceptions, such as Cambridge and Newcastle, and possibly Wye.

5067. You consider that that work requires overhauling?—I do.

5068a. What view do you take of the education which is given at the various agricultural colleges to the students?—I do not think, looking at it from my standpoint, that the curriculum which is laid down at the agricultural colleges in this country is a good one. In many of the colleges you will find, for instance, that the man who is teaching your son economic zoology is also the lecturer on economic biology, and botany, and probably teaching mathematics and mechanical engineering as well. It is quite an impossibility, in my opinion, for a man, in the rapid progress which is taking place in economic biology at the present day, to keep pace with that in all of these subjects—I am not speaking of the actual research work—to make himself acquainted with the results in so far as they bear upon his teaching, and how a man is possibly going to teach all those subjects I fail to see, and, as I say, I do not think the teacher very often is more than a page in advance of the student, and I must say the information given to the student is very often of a mischievous nature. I have heard that opinion expressed by farmers in different parts of the country.

5069. You think that further specialisation is required?—Yes, I think the work wants mapping out. I may look at it with a prejudiced eye, because I look at it from the biological standpoint, but my opinion is that the farmer is concerned mainly with plants and animals and the soil in which the plants are cultivated, and I take it that what he wishes to do if he cultivates a crop is to preserve it, and in the same way to get the maximum yield with the minimum amount of expense. If the curriculum in these different colleges was mapped out on the lines I suggest, it would bear more directly on the everyday practical work of farming. I should suggest questions in an elementary form as to plant breeding and as to chemistry and the physiology of the plant and of the animal, and of the application of general biological science to agricul-

ture. Those, I think, should be the main subjects. Then the students should also receive a certain amount of information on what is commonly termed now pure agriculture: that is the rotation of crops, the manuring of land, the chemistry of the soil and the drainage and measurement and so on of the land; but it seems to me that the biological side at present is put in the background, and I think I may say without hesitation that, apart from Wye and Cambridge, there is no college in connection even with the universities in this country where there is a specialist who teaches either the botanical or the zoological side. I think we are finding out in this country, as they have found out in America, that the moment a university or a college decides to have an agricultural department, with a professor of chemistry and a professor of botany and zoology who takes under his teaching the agricultural side of those subjects, it must end in absolute failure. The man is a specialist in morphology and physiology, and while those subjects may form the basis of any future work or application of the work, still that is not the man who is likely to apply the knowledge or be of any practical use in teaching the agriculturist, or to carry out experiments for the agriculturist. It has been very clearly shown in every university in America where they have established an agricultural department, I think without exception, that they have all had to put up a separate agricultural college and man it by specialists, and in some of the agricultural colleges there they have as many as five biologists on the staff—the subject of biology is split up into five departments and there is a specialist in each one; and in addition to a botanist and a mycologist they have specialists in horticulture in relation to the cultivation of fruit crops, and there is no question of the value of the work they are doing in the United States and the results they obtain. I do not think anyone in the world doubts for a moment the value of their work.

5070. Can you tell us where in America is the institution which you are describing?—Practically in every State there is an agricultural college of that description.

5071. On the lines that you have described?—Yes: certainly, speaking from memory, there are at least 40 or 50 such colleges.

5072. With the biological department fully developed?—Yes.

5073. That is the result of experience and the practical demand for agriculture in America?—Yes.

5074. You say that the farmers in England are very much alive to the necessity of further development in this direction?—Yes. Of course the thing the farmer is interested in principally is the financial result, and he can at once see there is a monetary benefit in knowledge of this kind. The difficulty I had when I first commenced with this work in the midlands was to carry out experiments on a large scale, say in orchards of 17 or 20 acres. No farmer would carry them out unless you agreed to guarantee the crop—if you agreed to guarantee the crop he would let you carry them out—but I have not the slightest difficulty now in that respect. I have five or six farmers who will keep at my disposal anything between five and ten acres on their farms for purely experimental purposes. In the Evesham district quite recently they have taken up the subject of spraying. The Worcestershire County Council have taken some interest in the matter and have appointed a man from Wye College to undertake certain experiments, the value of which seems at present somewhat doubtful. I went down into the Evesham district—I was invited by the Evesham Fruit Pest Committee to go down there and to explain to them the method and practice of spraying. I went down and gave a practical demonstration on an orchard, and I had about 70 of the younger growers present, and judging from the number of applications that I have had since, it seems that fully two-thirds of those men profited by the advice I gave them and have applied it. I am frequently receiving letters thanking me for advice from farmers and saying how well their crops look and how much they have profited by it.

5075. (By Mr. Medd.) Do I understand that you give your services quite gratuitously?—Quite.

5076. The whole expenditure that the University is involved in at present is only £400 a year?—Yes.

5077. You mentioned Stafford, Warwick, and Worcester as possible contributors. Which are the other four counties: you mentioned seven altogether?—Derby, Leicester, Shropshire, and Hereford.

5078. Is each of those counties represented to-day on

Mr. W. E.
Collinge.
—
29 May, 1907.

5069a

Mr. W. E. Collinge.
29 May, 1907. your Committee?—All except Hereford. The Hereford representative is the President of the Hereford Fruit Growers' Association. The County Council have not appointed their representative yet.

5079. The others each have one?—Yes.

5080. How is the £400 applied?—At present there is £200 which is my own stipend; the rent of rooms, exclusive of rates, taxes and water, comes to about £85—I am just speaking from memory now, I have not got the exact amount because we have not completed twelve months in the building yet; the assistant in the laboratory £20, the laboratory grant £20, the distribution of reports £15 and travelling expenses about £25.

5081. Have you formed any estimate yet of the capital expenditure likely to be required to set you going as an Agricultural Department?—Not as an Agricultural Department.

5082. Have you formed any idea as to the annual cost of maintenance? What would probably be the sum you would require for that?—Not for an Agricultural Department, but for a fully equipped Department of Economic Biology I have.

5083. What would that cost?—£2,000 a year.

5084. You could do it well for £2,000 a year?—Yes.

ELEVENTH DAY.

Thursday, 30th May, 1907.

PRESENT :

The Right Hon. Lord REAY, G.C.S.I., G.C.I.E. (*Chairman*).

Lord MORETON.
Mr. THOMAS LATHAM.
Mr. J. C. MEDD.

Professor WILLIAM SOMERVILLE, D.Sc.
Mr. A. E. BROOKE-HUNT (*Secretary*).
Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. D. T. COWAN, called and examined.

Mr. D. T. Cowan.
30 May, 1907

5085. (*By the Chairman.*) You are the Director of Education for the Hants County Council?—Yes.

5086. I understand you are prepared to give this Committee some evidence with regard first of all to the history of the formation of the Hants Farm School at Basing?—Yes. The school was started in 1889, but was the outcome of a very careful study of work that had been done in other counties. That study had extended over about three years, one way or another, the Committee not being quite satisfied for some time as to the type of school that would be most helpful to the county. Every type of agricultural school that had already been started in England was visited and some time spent at it. It seemed to me at the time in advising the Committee that our county could not itself start a very large institution, and that only a few institutions of the type that ultimately developed at Reading could be of service to the county. It seemed also that if you wanted a kind of intermediate school between the higher institutions and the elementary or secondary schools, as the case may be, you should have something that, without being too technical, without providing too scientific an education, would in a way continue certain of the best features found in the old apprenticeship system—I mean of the time when the apprenticeship system did mean a boy coming under a master who could and would teach his business. The Committee eventually agreed with the view I expressed on that point, and so we started the Basing School, which, I would wish you to understand, is really a very humble affair. If you take away the educational side—where the staff must be to a certain extent costly to be of any real service—the place is simply run as a small farm. When I tell you that the whole labour is simply a carter and a cowman, that is the beginning and end of it.

5087. (*By Lord Moreton.*) What is the acreage?—It is 71 acres.

5088. (*By the Chairman.*) That is briefly the history of the place?—Yes. The attempt was to make the fields the class-room, so that a boy in carrying out his work and in meeting with practical difficulties would have these difficulties explained and remedied as much as possible on the spot. The difficulties were further dealt with afterwards in the class-room, which room I may explain simply consists of one corrugated iron shed. There is another point I should mention. It seemed to my Committee that if that were the proper type of school to form a link between the higher and the lower institutions, it was undesirable to spend a large sum in erecting extensive buildings. The whole of the class-room buildings cost under £100. We did not find a dairy in the place, but we built one with materials supplied by the landlord at a cost of, I think, £350; the landlord supplied the materials and the Committee the workmen. There were some old dilapidated buildings which we converted into hen runs. We had more cartage room than we required, and this was converted by the students themselves during their second year into fowl-houses. We taught them carpentry, and it seemed to us that the best form of giving a practical application to that instruction was to give them something practical to do, so under our own instructor the students did most of the work in altering these buildings and fitting them to the needs of the school. That is practically in brief the history of our small institution. There is one other point I should like to mention, and it is this: it never struck me that the school was quite in the right place, but at the time there was great opposition on the part of the County Council to any movement in that direction, and in order to start the school at all we had to introduce a minimum for their consideration. Nevertheless one would have liked the school to be nearer the centre of the county, where perhaps we would have been on more typical soil. Basing is rather to the north of the county, the land

Mr. D. T.
Cowan.

30 May, 1907

being a kind of loam on a gravel subsoil, and partly loamy clay on a stiff subsoil of clay. The farm is in the valley of Loddon, where the clay beds run down to meet the Reading beds, and it is largely alluvial. The farm, as I have stated, is 71 acres in extent. It has 38 acres of grass and 33 of arable land. Fifteen acres of the grass consist of dry meadow and the rest of water meadow.

5088c With regard to buildings, we had no sleeping accommodation for our students, but by luck there fell to us the opportunity of getting a house in the village which had been built by a tradesman who wanted to retire there, and who didn't. We simply rented it, and have done so ever since. We can sleep 14 or 16 students there, as the building is rather like a town house, and, curiously enough, it is upon the farm land. That was a little piece of good fortune for us.

5089. Is there accommodation usually obtainable for other students?—We have three cottages as well, worth from £9 10s. to £12 per annum each, and we can put some additional students in them if necessary, but not very many.

5090a 5090. What is the course of study?—The course of study is made to suit the student who wants to go back to the land, and to take off his coat and work. It is not a place for the type of students who want to become land agents or teachers of agriculture and so forth. It is fitted, I think, really and only for the practical farmer. Therefore quite three-fourths of our work is practical work, the ordinary farm operations with a good course on dairying, to include cheese-making, and with a small but well-fitted agricultural department. Our gardens consist of only about 1½ acres. We lay ourselves out to take the sons and daughters of small farmers. The sons of some larger farmers come to us in certain cases, but we chiefly get people who want small holdings or go in for dairying and market gardening. I do not know that I need describe each of our operations, but I have indicated our aim, and shown that the work is largely practical. I may mention that we will have no students who will not get up at 6 o'clock in the morning to work. Anyone who will not do that is of no use to us, and we don't want him. Therefore the dilettanti type of students who want a little knowledge and little work will hardly find Basing the best place for them. We make no difference amongst the students, they must all be up early. A good deal of our field instruction is done in the morning, as well as milking the cows, bringing the milk to the dairy, and looking after the general work of the farm and garden. I hope the Committee will permit me to place before you later some evidence as to the actual type of students who have come. I have taken some trouble to follow the ultimate careers of these students, and have been able to trace over 200. I have tabulated these and would like to place the results before the Committee, so that you may judge whether our ideal of fitting the worker for the land has at all been fulfilled.

5091. Is there any entrance examination?—No, except that we usually take care that the students can read and write and do some arithmetic. Even with our scholarships the examination is chiefly a test of fitness to take notes and to intelligently follow the lectures.

5092. Of what does the school staff consist?—The resident staff consists of the headmaster and the dairy instructor, who has charge of the dairy, the butter and the cheese-making. The headmaster comes of a farming stock, his grandfather having been a farmer, and he himself being a gardener. That is all the resident staff, but we have a good travelling staff who periodically inspect in rotation certain work, and take particular subjects before moving on. We work the school economically by means of the travelling staff.

5093. (By Lord Moreton.) You mean a travelling staff under the County Council?—Yes. They include a horticultural lecturer, and a lecturer on horse-shoeing. We send our farrier to show what proper horse-shoeing is, not with a view to turning the students into smiths, but because we want them to realise that it leads to greater usefulness on the part of the horses if the feet of the animals are properly attended to. We have got a forge and the necessary tools in a shed, and the farrier gives as many lessons as he can once a week or a fortnight as the case may be. He also gives some instruction as to the structure of the hoof, so that the students may not regard it as if it were a block of wood.

5094. (By the Chairman.) Do the headmaster and the dairyman travel?—No; they are the resident staff. The whole labour of the place consists of a horseman and cowman. A working gardener in the garden under the travelling horticultural lecturer, and at such times as hay-making and harvest of course we have some extra labour.

5095. Do the students pay fees?—Yes, all the students pay some fees.

5096. Even the scholars?—Yes. The fee to anyone resident in the county, who is farming or doing practical work on the land or dairying is 10s. per week inclusive of board, lodging and tuition. If the student is a person only indirectly connected with the practical side of farming, the charge is 15s. per week, and to students from outside the county the charge is 25s. per week inclusive. The scholars are educated and boarded, but they pay 2s. 6d. a week to cover some small expenses.

5097. Are the scholars all resident on the farm?—Yes.

5098. But not the other students?—They are all resident.

5099. Do they live in these cottages and in the boarding house?—Yes; they are all under the same control.

5100. Have you a grant from the Board of Agriculture?—We got our first grant in March of last year. We did not press the matter earlier, because we rather thought we were not an important enough institution to be recognised by the Board. We had no big laboratory fitted up, or anything like that. Our aim was really to bring into the farm the best of the old apprenticeship system, if possible, plus a certain amount of science, including milk analysis and suggestions about manuring; but we did not at first approach the Board about it. When we did do so they met us generously and at once gave us £100 last year, and again this year.

5101. Is the county responsible for the financing of the school?—Yes.

5102. Is everything else paid by the county?—We received in fees and sales of butter and farm produce last year about £850, and the cost to the county was £650—the nett cost—but that includes the staff, the headmaster, dairyman, &c.

5103. What is the rent paid for the farm?—The rent is £75.

5104. (By Lord Moreton.) Does that cover all, free of tithes, &c.?—Yes.

5105. (By the Chairman.) Do you teach the students any book-keeping?—Yes; the course includes book-keeping. Apart from the books which we have to keep for the Local Government audit, there is a complete set of farm books, showing the whole expenditure, and they are open to the students if they care to examine them, with the consent of the headmaster. Book-keeping is an important feature of our work.

5106. Who gives that instruction?—The headmaster, who has himself been in the position of manager of a big market gardener's place, and who is accustomed to the business side.

5107. Do you teach botany or chemistry?—Yes, we teach a combination of botany and the elements of physics and chemistry. We teach these things, so far as we can, practically. We are not trying to make our students scientific persons, but to make them understand the value of science, to have the scientific attitude of mind.

5108. You give as much time as is necessary to illustrate the various processes of agriculture?—That is so.

5109. Do any of your students afterwards go to the Reading College?—Yes, and I would like to point out that our school plays an important part in linking up our work with Reading College. Before our school was started, we tried to send students to Reading direct without any intermediate institution, and, although we advertised three years, we only had one young man anxious to go to Reading direct, and his father was in a position to send him without our help at all. Our attempt was then a dead failure, but whenever our school was started as a link we always had farmers' sons ready or anxious to go to Reading. We have a butter school travelling summer and winter, and sometimes making butter in sheds when the thermometer is precious low. We desire to teach the students to make butter under all conditions. The horticultural lecturer travels and gives instruction to allotment holders. There are a certain number of exhibitions tenable at the farm school, and there are six scholarships offered to the sons of farmers or bailiffs for the butter course. The best of the students are sent on to Reading. We have only two scholarships to Reading, but there is keen competition for them. The examination is conducted by the Reading College. We have never, since we started, failed to find a keen interest taken in the work done at Reading. An interesting point is that many of the students sent to Reading with these scholarships go back to the land. If a farmer's son wants to go to Reading with our help, he must go through our school first.

5109a

Mr. D. T.
Cowan.

30 May, 1907

5110. What is the length of the ordinary course ?—The course is six months. The students come in on the 1st of October and remain till the end of March.

5111. Do they get a certificate at the end ?—If they pass an examination conducted by the Reading College.

5112. Do they return afterwards to the school ?—Yes, some of them do. We have about half a dozen students who have returned, but our difficulty is this, that the students who come most of them are sacrificing wages to come, that is, they are boys who are earning, it may be, 7s. or 10s. a week, and it is not an easy thing to persuade a boy or persuade his parents to give up that in order to come for six months, but they have done it, and, practically, 70 per cent of the boys were, what one might call, wage earners with their fathers. To give you a recent example, there was a boy who was earning 10s. a week, and a very useful boy to his father, but I saw his father and he said he would send his boy, and he did send him for six months, and I have a letter stating how much benefit he received from the instruction. But that alone, you see, will prevent the boys returning again in any large numbers.

5113. In the summer ?—Yes: some of them do for cheese-making. Hard cheese-making is only done in the summer because we have no artificial heat in the place, and you cannot make Cheddar cheese without artificial heat, so we only make it in the summer, beginning about May on to about August.

5114. I understand you only have a very limited number of students in the summer ?—We take girl students in, you know. In the winter we work boys mainly, but in the summer we work boys and girls, so that we have a good number of the summer students.

5115. Then you have both a winter course and a summer course ?—Yes. The summer course is divided into short courses for special subjects, chiefly dairying, but we have as well short courses in horticulture, practical grafting, and one might also say, a nature study in a large way, and we have domestic work. For instance, supposing a girl wants to marry a farmer, and we have several, they come to us for dairying, gardening, cooking, laundry work and house-keeping, and they are taught those subjects.

5116. Then you teach domestic economy as well ?—Yes, to that extent.

5117. There is a female teacher for that, is there ?—Yes, but we will not take a student for domestic economy only: that is not our purpose.

5118. Quite so, but as an additional branch, you do ?—Certainly.

5119. And cooking ?—Yes.

5120. There is a woman who teaches that ?—Yes; I have a good travelling staff for domestic subjects, and I work them at the school as well.

5121. The summer students are, therefore, a different class of student from the winter student ?—May I ask what is the exact differentiation to which you refer ?

5122. What I meant was that they come for shorter periods ?—Yes; of course, they are not of a different social class.

5123. No, I did not mean that; they are a different class of student in the respect I have mentioned ?—That is so.

5124. And mainly women in the summer ?—They are, practically, half and half, half boys and half girls that have passed through the school.

5125. You are not now referring to summer students only ?—No, to all the students.

5126. Perhaps you will just explain to us what is the travelling staff ?—Yes. To take butter making, we have a van fitted with the necessary apparatus which visits the various villages and teaches butter making—we confine our attention to butter making, cream cheese making, and a little poultry trussing, and at the end of each course there is an exhibition offered to the best student tenable at the Farm School, and the resident instructor at the Farm School is the examiner. We have a smiths' shop also that travels in the same way, and the instructor visits the Farm School periodically to give instruction in horse shoeing to the boys—or, rather, to show how a horse ought to be shod. Then there is the horticultural instructor who has the supervision of school gardens, who carries out horticultural lectures and is responsible for the acre and a half of gardens that we have at the present time at the Farm School. He takes the students who come for the horticultural work at the farm school. Then there is a domestic economy staff, one of them taking the girls in the summer time who want cooking instruction, and so forth. So that the whole of these are

worked in as part of our farm school staff, although they are not paid by the Farm School; they simply go in one day a week or one day a fortnight, as the case may be.

5127. Does the domestic economy staff travel too ?—Yes, we have the same staff doing the work in the elementary schools and the work in the secondary schools and the work at the Farm School, so that they are familiar with all three.

5128. Now with regard to the after history of the students, you told the Committee that you would give them some information ?—I do not appear to have my paper with me.

5129. Then, perhaps, you will send it in to the Committee ?—I had the whole of that tabulated, and I should have liked to submit it to you, but I do not appear to have it. I can, of course, send it in to you. *The Witness subsequently sent to the Secretary the statement referred to which shewed that :—*

The total number of students attending the school during the school years 1900-1907 was 268 of whom 143 were females and 125 males. The sources from which these students have been drawn may be divided as follows :—

Farmers or from farms	164
Farm Bailiffs	20
Dairymen	19
Gardeners	7
No farming connection	58

Total..... 268

Present or recent positions occupied by above students :—

Engaged on farms	104
Assistants in Estate Offices	4
Dairymaids and Dairying	89
Farming on own account	12
Small Holdings (Poultry)	2
Gardeners	5
Colonies	26
No definite record. Many of them women students who married later	26

Total..... 268

5130. Does the staff of the school give any advice to farmers. Do farmers come to you for the purpose of consultation ?—Yes. I will give you an example, but I should not like a note to be taken of what I say. *(The Witness gave the example.)*

5131. You have no dairy factory at the Farm School ?—No, and I do not think there is one in the county—I do not know of one.

5132. There is a proposal, at present on foot, to put up a dairy factory ?—Yes, that is what they are doing at Petersfield.

5133. The county is proposing to put up a dairy factory ?—No, by the farmers in the county.

5134. *(By Lord Moreton.)* It is a private speculation ?—Yes.

5135. A co-operative affair ?—Yes.

5136. They have consulted you as to that ?—As to the practical side of it.

5137. *(By the Chairman.)* What is the attitude of the farmers towards your school—is it satisfactory ?—The attitude of the farmers at first was rather antagonistic; they did not think that the school would fulfil all that we hoped, but we placed on the committee of the school a majority of farmers, consisting of some of the ablest men in the county, in whom the farmers had confidence, and, bit by bit, the objection has disappeared, and we have been invited by various farmers' clubs in the county to exhibit at their shows to show what we are doing at the school, at the Basingstoke Show, for instance, and the Romsey Agricultural Society, and we have, I think, overcome that antagonism. Certain it is that they speak now with a great deal of respect about the work, and certain it is also that we are getting them to send their children to the school. I have here a table showing that we had 55 students last year attending, that is, during the winter and summer, and I should like, if I may, to just run down the occupations of the parents and you will see: farm bailiff, farmer, farm bailiff, farmer, farmer, farm bailiff, farmer, farmer, farm bailiff, land agent, schoolmaster, schoolmaster, farmer, merchant, farmer, farm bailiff, the next six are farmers, fruiterer, farmer, farmer, farmer, no parents, then four farmers, fruiterer, farmer, then ten farmers, gardener, planter, farmer, farmer, farm bailiff.

5138. *(By Lord Moreton.)* May I ask what a fruiterer is ?—He is a man who sells fruit in Basingstoke and runs

a market garden. I think that list is a sufficient answer on that point, because taking the whole, I do not think there are six who are not connected with farming or with the land in some way or other.

5139. (*By the Chairman.*) That includes the winter as well as the summer students?—It includes both winter and summer students.

5140. (*By Mr. Latham.*) I should like you to go much more fully into your work at Basingstoke at the show?—We have been trying to get the farmers interested by presenting them every year, in some part of the county, with the result of the whole of our work in the form of an exhibit. We send the wheat and oats and the roots and whatever we can according to the period and place them before them, and we arrange an exhibit on the educational side as well. We present the whole of our work; cheese is made, chiefly Stilton, and butter is made, and we send the wheat and oats and the roots, and we say, "That is our product," and while the show is going on we have our staff from the school, with the students, to explain things in connection with the exhibits and to give illustrations and little lectures of, perhaps, 10 minutes each. I think, probably, you have seen our exhibit at the Basingstoke Show.

5141. Yes, and I have taken great interest in it?—It has proved very successful; the rooms are simply crowded, sometimes you cannot get through them. That was the suggestion of the farmers on the Committee; it is entirely their doing.

5142. (*By the Chairman.*) To show by these various exhibits what are the results of the teaching in the school?—That is exactly it. I do not think you can show a farmer better than by saying, "There is the grain we grow under conditions which, of course, are school conditions," and, of course, we send it in sufficient bulk to make it something more than a mere little toy exhibition.

5143. That is accompanied by explanations given by the staff of the school?—Yes.

5144. (*By Lord Moreton.*) I think you said your farm was 71 acres?—Yes.

5145. I see as a matter of fact—I do not know whether you have noticed it—that in this report it is put down as 61 acres?—It ought to be 71.

5146. Can you give us a rough idea of the stock on your farm?—Yes. We have two horses, 10 cows, I think we have about four heifers, a certain number of pigs and about 100 head of poultry.

5147. Any sheep?—No; that is the one thing where I am afraid you have touched our weakness. We ought to run a small dry flock.

5148. Hampshire is essentially a sheep county?—Yes; but you see we are on the clay where we are, and the place is small.

5149. I suppose if money was no object you would feel you could not do better work than by enlarging your boundaries and having a breeding flock?—I should like very much to have a dry flock at any rate. Like a very distinguished man, I am not an agricultural labourer and I am not in a position to pass any opinion on that subject, but if I had my own way I should have the farm 150 acres, and I should certainly have a small flock.

5150. Your school being of course caterers for the county of Hampshire, do you think that the Hampshire farmer's son is getting the best education he can to farm in that locality without any technical training in the management of sheep?—I confess that is a weakness.

5151. Yes, it seems to me that that is the very weak point in the whole establishment?—I may say that it has been discussed, and last year we went the length of serving notice under our lease. I think, however, considering the fact that we were in the melting pot with regard to higher education as a whole, and that that brings up a good deal of opposition, we might have had the whole of the original fight to face again: with extra expenditure, the Committee thought we had better go on in the way we were.

5152. You teach, I suppose, elementary veterinary science?—That is done by the head-master, but we have an occasional visit from a veterinary surgeon. We have a man semi-officially attached to the school.

5153. I take it you teach what we might call first aid?—Yes, exactly.

5154. How far do you take your pupils in chemistry?—A quite elementary course, rather with the view of getting them to look upon chemistry as something that can be helpful to them, and can present to them a means of getting

at and understanding what they are going to use, and that analysis of cake and of manure are of value, but not that they can actually do it themselves.

5155. That is what I want to come to. Do they learn enough in your opinion so that in after life when they send for instance a sample of cake up for analysis and receive the analysis back that they will be able to see it is deficient in certain qualities, and to understand what the analysis means?—That is exactly our point. We want them to understand what is meant when they get an analysis.

5156. With regard to book-keeping, the book-keeping you teach, I take it from what you say, is entirely of an agricultural type?—Yes.

5157. Not of a general commercial type?—No—simply in connection with farming.

5158. Are the books audited?—Yes, monthly from the office, and then they are audited by the Local Government Board auditor—whatever book is brought into the audit is audited by the Local Government Board auditor.

5159. Are all the pupils who come to you in receipt of scholarships—I think you mentioned something besides scholarships—are all your students in receipt of public money, or do some of them who come to you pay for their own keep entirely?—It is almost half-and-half.

5160. I rather understood you to say that all the pupils were in receipt of public money?—No; there have been 135 paying students to 133 scholarship students during the time we have been at work.

5161. I understood you to say that some of your agricultural students go on to Reading, but that your dairying and horticultural students do not do so?—That is so.

5162. Is that because the county of Hampshire does not afford facilities for the purpose, or is it because there is no inclination on the part of those students to go on?—I think it is largely the choice of the students. You see the horticultural students are usually small people.

5163. Let us eliminate them from the question then and confine it to the dairy students. The dairy students do not go up to Reading in the same numbers as the agricultural ones do, I understand?—No; we have had very few; I do not think we have had two in three years. You see the work that we do at our dairy school—and I think Reading would probably express the same view—is such that so far as butter making is concerned they get all they want from us.

5164. That is just the point I wanted to come to. I may take it then that the pupils who have been through your dairy course consider that they have learnt sufficient of the science of butter making to carry them through all the work that they would be required to do in the county of Hampshire?—Quite so. The dairy work is very well done at our school, and complete in itself.

5165. (*By Mr. Latham.*) What lectures have you given in the county?—Chiefly horticultural. We have done a great deal in veterinary lecturing, but we stopped that last year for want of money. We had veterinary lectures on the care of animals and farm hygiene every winter up to last winter, when our funds ran down. Our "whisky money" used to be about £11,000, but it is only £8,000 now, and that has very much hampered our work. May I just say one other word about the Farm School with regard to a feature that was introduced two years ago, and which I find is very much appreciated. We get an engineer to come in every week during the winter to teach the boys to take the machinery apart and put it together, to take out a damaged part, and do it in the field, and put it back again. It is all done practically. The instructor does it first—it may be a binder, or whatever it is; we have more machines than are used on the farm—and the boys help afterwards. They start and take it apart and take the damaged part out for repair and put it back again. I am informed that that work is very much appreciated; the farmers tell me that it is of value.

5166. How far do those lectures extend. You have given us veterinary?—Horticulture.

5167. No agriculture?—In agriculture we have done no travelling work. We carried on certain manurial stations in the county for a certain number of years and then they fell out, I believe largely for financial reasons, I think I may safely say that. We had one at Lymington, one at Fareham, and one at Botley, but those have dropped out within the last three years or so.

5168. If you had more funds would it be profitable to the district to get these lectures extended?—I think on the whole it would, but there is a considerable difference

Mr. D. T.
Cowan
30 May, 1907

Mr. D. T.
Cowan.
30 May, 1907

of opinion as to the value of these demonstration stations and a number of my Committee consider it is better to confine the work and have it directly under the control of the head master at the school.

5169. I know there is such a very great difference in the soils in Hampshire that it would be bringing it into a very small sphere to have it only under the control of the school?—That is my own private opinion—that we ought to have continued the work, but it is largely a question of funds with us. Hampshire has a large amount of forest land: in the New Forest alone there are 96,000 acres of forest, and the county does not get a very large grant, and when you come to £8,000 “whisky money” to spread over the whole of our higher education, it leaves very little, and I am afraid it is largely a question of funds.

5170. If you had more funds, you have ample scope in which to spend them?—Undoubtedly.

5171. I presume the travelling farriery school, which I know something about, you consider is quite sufficient for the smiths?—Yes.

5172. Do you have any veterinary surgeon attached to the school?—Yes, we have a veterinary surgeon attached to the school who pays periodical visits and gives instruction, and we have also systematised the examinations—for instance any holder of our certificate on presenting it to the Farriers' Company would get registration without going through any other exam.

5173. Does the instructor give lectures on the structure and formation of the horse's feet?—Yes, the instructor himself does that.

5174. Where does the higher education, the scientific instruction, come from—yours is all practical?—We confine it entirely to the evening schools, linking those up with the Farm School, and then linking the Farm School up with Reading College.

5175. You do not have anyone down from Reading College to give scientific instruction at Basing?—No, it is done by our own staff.

5176. Which of your staff does that?—Mr. Newsham, the headmaster, and Mr. Yates, whom I dare say you saw in charge of the Nature Study Exhibition at the Royal Counties Show. Mr. Yates is a Reading College student and a farmer's son.

5177. Does Mr. Newsham hold any degree?—No: he is chiefly practical, and a thoroughly good man for the position.

5178. Is he sufficiently instructed to give this scientific education?—Yes, up to the point where we think we can best fill the place.

5179. Does he do the analytical work?—We do not do analytical work in the sense probably in which you are applying it. We simply are trying to instruct the students to have a sufficient knowledge of elementary science in order to enable them to understand what lies beyond.

5180. You cannot get your soils analysed then?—No, we do not make any attempt at that. We give some idea of what one would call the physical side of soils, and show how they may be roughly differentiated, but we make no attempt at analysing soils, and simply try to get the student to understand sufficiently so that he may bring trained intelligence to bear when he comes to deal with analyses of soils.

5181. There is nowhere in Hampshire where that could be done?—That is so, except it is at the Hartley University College, where there is a very able chemist, Professor Boyd, who could do that as well as any other, but not otherwise.

5182. Where do your students come from? Do they confine them to the country?—They are chiefly confined to the country, but not altogether. I have brought up a list of our last year's students tabulated with their addresses, and I should say 90 per cent. are county students.

5183. I suppose county students take precedence over those from other counties?—No. If a student from another county cares to enter, we would certainly accept him. Of course, we would like to meet the needs of our own county first, but there is no rule about it. If any Berkshire or Oxford student were entered, we should not turn him out to make way for a Hampshire student, although we prefer our men to come first.

5184. You run the dairy school all the year?—Yes, the travelling dairy school and dairy at the Farm School all the year.

5185. You said you made butter in the winter as well as in the summer?—We make butter all the year round,

but not hard cheese the whole of the year because we have no artificial heat.

5186. Was that your dairy instructress that I saw yesterday, Miss Darrell?—Yes, she is the head of the travelling school. She used to be examiner for degree work at Aberystwyth, I believe; she is very highly qualified, and I think the staff are generally.

5187. You spoke of the show at Basingstoke, in which I take a great interest when I go there. You show Stilton cheeses and different things at that show?—Yes.

5188. The whole work of your little institution is brought there to show to the general farmers exactly what has gone on during the whole of the year at your school?—Precisely.

5189. It is taken very great interest in?—Yes.

5190. And I may say that very possibly your cheeses are valued?—I only know we could sell three or four times the amount we make, and, if I tell you I one year sent our cheese down to Brighton and got 9½d. in the open market for our Cheddar, you will probably admit that is a good price.

5191. I do not know whether you are diffident in saying much about your work or not, but I think the school is of a higher value than you are willing to give your opinion about?—I suppose one does not care to make too much of one's own child in public. Nevertheless, I am very proud of the school.

5192. May I put it in this way, that you do a very valuable work and that you cannot do more than you are doing without more funds?—We are very much hampered for want of funds.

5193. That is what I wanted to know.—I did not think it would be right of me to make too much of my school, although I am immensely proud of it, and lead people to suppose that it was a great institution with great buildings and a great staff when it is nothing of the kind.

5194. If you had more money could not you make it a great institution?—If we had; but at present we are very much hampered for want of accommodation. We want more accommodation for our students, and we would like a larger farm for instance. If we could get help for that I am perfectly sure we would get a farm in a situation in Hampshire where we could get typical soil. That has always been the question that has been foremost when the matter has been discussed, but that means more money, and we cannot do it. We have had a great fight in the county to get any rate aid at all, and it was only passed last Monday for the first time. That has always been our one great difficulty, but I do say, if that is the point you want me to mention, that I consider we are doing very very valuable work there, and I am of opinion that we could do more valuable work if we had the funds, but we are hampered for the want of funds.

5195. You do not give scholarships from the farm school to Reading College?—Yes, we do; but we will not give a scholarship to Reading except through the Farm School.

5196. You made a remark just now as to passing them on to Reading. Would that be by means of scholarships?—Yes. At the end of six months Professor Percival comes down and tests the boys out in the fields in everything, even to putting the horses to the plough and taking them away again, and all that practical kind of work. They have to do everything, feeding the animals, and so forth. The boys do all that: they have to do milking in the cow sheds, and then there is a paper examination on the science work, botany, chemistry, physics and so forth. As a result of that we pick out the two best and send them to Reading the next winter. There again, we have not money to send more.

5197. (By Lord Moreton.) They would go to the short course there?—They would go to the farmer's course at Reading.

5198. (By Mr. Latham.) This practical school of yours is thought to be the best feeder for the scientific teaching afterwards?—I think so.

5199. And that only those who are proficient in the practical side get the chance of going to Reading?—That is so.

5200. The county do give other scholarships, but not agricultural scholarships?—Yes, we have a scholarship system for sending boys and girls from our secondary schools to Reading College, and we gave Reading College £1,000 to found those. In the year 1897 we gave Reading

College £1,000 to help the building on consideration that we could send three scholars every year from our secondary schools, but not for agriculture.

5201. I understand that the scholarships in agriculture mean that the student must go through Basing first?—He must go through Basing first, in fact, the agriculturist would not have a ghost of a chance for the others, because the standard of examination is so high. If a boy was able to take one of our senior scholarships straight away, he, probably, would not think of taking to farming, and we do not want that; we want the man who will take off his coat and work after he has been through our school, and we have, actually, the type of boy who does go back and labour and helps his father if he is a small holder, say, of 50 acres; he goes back and is a boy who has to be up in the early morning and work late, and so forth. We have that type of boy. I have not the figures, but I may say this, that taking the 268 students who have passed through the school up to last October, quite 90 per cent. of the ones that I have traced have gone back to work on the land.

5202. You keep yourself in touch with them?—Yes. I introduced a system when we started our scholarship system, when I first went as Director of Technical Education—I was first appointed in Hampshire as Director of Technical Education—and I tried to get a record of students who had gained scholarships and who had been helped in any way. It is very difficult to follow those, as you know.

5203. Yes.—But I have traced all through the Farm School except 50, and of those only four have become assistants to land agents; the others have gone back to the land.

5204. I was going to ask you if you could give us what proportion of those students had become land agents and valuers?—I can give you that figure right off—four.

5205. Can you give us the same figure with regard to the farriery school?—We happen to have a most fortunate man, the son of a fairly large farmer in Hertfordshire, in charge of that.

5206. What is his name?—Powis, a most excellent man—you have, probably, met him at the Show, and he has captured all the smiths. Since his coming we have not been able to take all the students who apply to come to the school, and about 18 months ago I suggested to the Committee that we might, for the first time, introduce a fee for the 10 lessons of half a crown. We did that, but it has made not the slightest difference. We got as many students as ever.

5207. (By Lord Moreton.) Those students, I take it, are men in the profession?—Yes, apprentices, doormen, smiths and master smiths. We have never a vacant place in school. There again, we have never got any grants until last year, when, I think, we got a grant from the Board of Education. We are in this very curious position, that in our attempts to get a little aid, we have part of our work under the Board of Education, and part under the Board of Agriculture, which makes matters a little difficult, having a dual central body of control. That is merely in passing, however, but it exists. I was told by a very prominent farmer in the Meon Valley, with regard to that school, this; he said—"I consider that your school has saved us hundreds of pounds by showing the smiths that by good shoeing you prolong the life of the farm horse."

5208. (By Mr. Latham.) You have not given us anything like the numbers, and if you could it would be very valuable, of those who have passed through the farriery school?—I should imagine, roughly speaking, about 600.

5209. Now with regard to the dairy students, can you give us a rough idea as to what number of dairy students you have?—We run about 16 classes of 10 days in the year, and it averages out at 8-9, I think, per class—call it 9, that is summer and winter.

5210. That is about 150 a year?—Yes.

5211. For about how many years have you run that?—We started in 1894.

5212. Taking your county, generally, has the improvement in butter been very considerable since the classes have been working?—I think so. I can only say that I have a letter from a man who deals in butter at Southampton who stated that in his opinion—he is not a farmer at all—the butter had very much improved in the district since we took to this work.

5213. Do you have examinations of the smiths, and do they compete for prizes periodically?—Not prizes, but certificates. The examinations are held periodically; it depends upon the number who can come, but if the number would justify the expense, we hold an examination, and we

inform the Farriers' Company, and by an arrangement with them our certificates are accepted as qualifying for their registration.

5214. I scarcely like to ask this question of you, but do you ever invite the Farriers' Company down to see what good you are doing to farriers?—We have always invited them down to our examinations.

5215. Do you ever ask any member of the Board of Agriculture to come down to your farriery examination to see the exceedingly good work you are doing?—No, but Mr. Brooke-Hunt has a general inspectorial right, if he likes to exercise it. We welcome him on all occasions.

5216. But I am afraid he would not know when these things happen if you do not send him an invitation?—He is down there constantly. We keep him in touch with our work, although we get no grant for it, and, periodically, I go about with him in the county.

5217. There is no work in the country more valuable than that?—Undoubtedly, it is one of the best things that we put our hands to.

5218. And no one values it more than the farmers, and the merchants, and the dealers in horses?—Quite so.

5219. (By Dr. Somerville.) Do I understand that a considerable proportion of the 600 pupils that have gone through the farriery school have become registered as blacksmiths or shoeing-smiths?—I should imagine quite one-third of them, probably half; it would be difficult for me to get statistics as to that, but I could get them.

5220. A large proportion then are registered?—A very large proportion.

5221. I suppose the man either proceeds to secure a shoeing forge for himself, or goes as an assistant to a man that has one?—Yes; they are very keen on registration.

5222. I suppose a man that holds a farrier's certificate is under no obligation to practice the profession?—No, but we will not take him into our school unless he is practising.

5223. That is the point then—you do not take in young farmers?—No; we teach young farmers at our school.

5224. You will not give a young farmer the opportunity of acquiring the art of shoeing?—Not at our travelling school.

5225. (By Mr. Medd.) In answer to Lord Reay, I think that you said the buildings only cost the county £100?—Our class-room building?

5226. Yes.—Yes. It is simply a corrugated iron room, without brick foundation but lined with match boarding.

5227. What has been the total capital expenditure by the county?—Do you mean stocking the farm as well?

5228. Yes—all that you put down to capital expenditure?—The dairy cost £350, the class-room we put at £100, that is £450, and I should imagine that we stocked about £9 an acre, off-hand; I could not give you the exact figure.

5229. For 71 acres, that would be £639?—Yes, I imagine it would be about that—certainly, we did not run into £10 an acre for stocking.

5230. Do you rent the land?—Yes.

5231. What length of lease have you?—We had a lease for seven years, renewable for another seven, but we are now simply going on from year to year by reason of the fact that we hope to get on to a more reasonable farm.

5232. What rent do you pay?—£75.

5233. With regard to the income, I think you told Lord Reay that the fees and the sale of produce amounted to £850?—Yes.

5234. The net cost to the county is £650?—Yes.

5235. The Government grant is £100?—Yes.

5236. That is £1,600, altogether?—That is so.

5237. In the Government Report it gives a total expenditure of £2,920, so that there is a balance of £1,320?—Yes, but that is the whole of our agricultural work; the farriery school, the travelling dairy school, horticulture, and so on.

5238. You put down £1,600 as the actual cost of the Basing school. £1,320 is the total agricultural expenditure?—That is so.

5239. What is this Board of Education grant exactly?—The Board of Education grant has not been with us long enough to enable me to pass any judgment about it, because it is given on per student per class and it is rather difficult to estimate, and sometimes we get £2, and sometimes we get £3, according to the particular subject of

Mr. D. T.
Cowan.

30 May, 1907

Mr. D. T.
Cowan.

30 May, 1907

instruction and at what the class is valued. We do not get a lump grant at all.

5240. You are not getting it as a block grant under Clause 34 of the Regulations for Technical Schools?—No: we are negotiating now with the Board for the block grant for the county.

5241. What, roughly, is the amount which comes to you from the Board of Education which goes into your agricultural expenditure?—I have not the exact figures in my head; it is a very small sum, but I could give you the one and only grant we have got in connection with our Farm School. That was £63, quite unexpectedly.

5242. What was that given for?—For our horticultural work and dairy work.

5243. As a kind of technical day school?—I am afraid it was not very definite.

5244. It would come under a technical day school and it would have come as that.—I think it must have been.

5245. I may take it that all counties under present circumstances could not afford to start a similar institution to yours?—I do not think each county would find it profitable to have a similar institution.

5246. Even if it had the money?—I think not.

5247. Are the counties affiliated to Reading in any way associated with you—Dorset, Oxford, Bucks, and Berks?—No, we have had, I think, one or two students from Dorset, and I think we have had two from Sussex, but there is no affiliation, and there is no organic connection.

5248. If there were a system of organised agricultural education for that area, possibly your school might be taken as the intermediate school for the area, just as Reading is the advanced college for the area?—We could do it quite thoroughly, with the exception of the sleeping accommodation.

5249. You could do it?—We could do it.

5250. What is the present accommodation?—We have sleeping accommodation for 16, but we can put them up in cottages. Sometimes we put up about 30 at a pinch.

5251. Is there any way of extending the buildings where you are now. You suggest removing elsewhere. Would it be better to move elsewhere?—I certainly think myself that a typical Hampshire farm for educational purposes would be better.

5252. Have you any particular locality in mind?—Yes, I would prefer to be nearer Winchester, which is absolutely the centre of the county, and where there is typical soil.

5253. If you moved and extended your area and cultivation and buildings, you would have no objection to act as the intermediate school for this area, I suppose?—I can only say that I think my Committee would agree with that, but I cannot pledge them.

5254. Of course your Education Committee in my scheme would retain the absolute control and management of the school.—Yes.

5255. With regard to the instruction, I notice that you go periodically to the Basingstoke market. Do you have the Board of Agriculture market records?—I think we get every publication of the Board.

5256. You do not know whether the students are regularly supplied with the market records?—I do not think so, but there are visits to the Basingstoke market every week. Some of our students go into Basingstoke under one of the teachers every week.

5257. Do you know whether stock is sold by live weight at Basingstoke?—I do not think I can answer that.

5258. With regard to the instruction in machinery, have you any difficulty in getting machines?—I do not think so. Messrs. Wallis and Stevens, who supply their man to us, are quite sympathetic with our objects, and as a matter of fact they have fallen in with a scheme not connected with the Farm School, but another scheme, by which they give an additional award to their apprentices who attend their engineering course at Basingstoke, and it is their man who comes out to us, and he is very systematic with the work.

5259. Do you get the machines brought to the school, or do you have to go to the farms and use them there?—We try to get them to the schools as much as possible, because we want them on the spot.

5260. Do you combine simple mechanics with the instruction in machinery?—Very simple. I do not think

our headmaster is very strong on that point, but there is some.

5261. It would be advisable to combine some elementary mechanics?—It certainly would make the work more solid. You see that again probably means another teacher, and you cannot introduce another teacher without having sufficient funds.

5262. With regard to the winter courses for the men what is the average age at which they attend?—We do not want them under 15, if possible. I should say the average age is about 18; we get them from 15 up to 20.

5263. Are there any bursaries available which would compensate them in any way for the loss of wages if they are sons of poor parents?—No, only in this way, that six of the winter students get bursaries or scholarships.

5264. That would merely cover the cost of maintenance?—Yes. As a matter of fact, as I was pointing out to the Chairman, the important work that I see we are doing is in getting the farmers to send their sons to us when they are sacrificing wages.

5265. That is very valuable, but there may be competent and good lads whose parents cannot really afford the loss of the wages the boys are earning. I was merely asking whether there are any bursaries available which would compensate them for that loss?—No.

5266. With regard to the training of teachers, do you do anything in Hampshire now?—We have not for two years, but we had several courses—we had 30 teachers for three years running.

5267. Might you not use Basing to some extent for that purpose?—Very much; I think it is very necessary work.

5268. You might either have a short course, or you might have Saturday courses throughout the year there, might you not?—I do not think we could run a Saturday course as well. The staff are very hard worked; they have to be up at six in the morning on the farm, the head master as well, and they must have some leisure, and we really could not run a Saturday afternoon course without infringing very much upon their leisure time.

5269. With regard to the school gardens, are they under your supervision?—Yes, the whole of them.

5270. You have a very considerable number, especially in the Isle of Wight, have not you?—I am not Director for the Isle of Wight. The Isle of Wight was separated from our county for educational purposes by a special Act, 15 years ago.

5271. With regard to the continuation schools, what horticultural or agricultural instruction do you give in those?—We are giving the whole of our horticultural work with our evening classes now, and it will be more so in the future.

5272. What will the horticultural instruction comprise?—It comprises lectures by our own man—four lectures, and includes, whenever we can get it started, a school garden under supervision, and in the evening school proper it will comprise certain affiliated subjects.

5273. In some of your evening schools you have been teaching what one may call minor rural industries, such as basket-making, have you not?—Yes.

5274. They have been very successful, have they not?—They have been very successful up to a point, but the strawberry and fruit industry has been growing so that we have not latterly had the cottagers making any baskets, but there is another movement this year again, and next year we shall be active, I think. But we have been very successful with that.

5275. I thought so, especially in the neighbourhood of Southampton, the strawberry-growing district, where there is one school in particular—I forget the name of it?—Yes, that is at Sarisbury.

5276. You mentioned a scheme for higher education. Is that still under consideration or has it been adopted?—It has been adopted.

5277. Can you give us some indication of the nature of the scheme that you have adopted?—In the first place we should have the chain quite complete between the elementary school and the Farm School up to Reading by means of linking the elementary school with the evening school, the evening school through the horticultural work and butter-making with the Farm School, and exhibitions from the Farm School to Reading. It has been a little bit haphazard up to now; but last Monday the Council passed the scheme and it will be a permanent machine for carrying on the work in that organised way.

5278. That is exactly the scheme one would wish to see introduced in each county, which would link up the elementary and the continuation, through the farm school, up to the advanced centre?—There is an important thing in connection with that that I should like to mention. Our agricultural scholarships are organised through the head masters of the elementary schools and the farmers' clubs. We ask the head masters of all the elementary schools to place a sufficient number of hand bills, bearing on the exhibitions, into the hands of pupils who have just left and who are connected with the evening schools, so that we make use of the schools and the farmers' clubs in that way. We send a sufficient number of hand bills to every school and farmers' club in the county for distribution.

5279. (*By the Chairman.*) In what respect would you expand your school supposing you had sufficient funds? What further development would you give to the school?—In the direction first of getting a larger and more suitable place and simply developing our present method. I do not think I would alter the method, because I think it meets the needs of the county.

5280. Would you increase the staff in any way?—Yes; for instance I should like to see the science side a little stronger than it is. That is not so strong as I could wish it. I should like to see that better.

5281. You wish the practical character of the school to be maintained?—Yes, quite. I think for what we have set ourselves out to do it is the most important thing there to have that practical work thoroughly done, thoroughly understood and scientifically explained.

5282. Whatever deficiencies exist in the scientific training of those students who leave your school and go to Reading, those deficiencies are then made up at Reading?—That is so.

5283. Your view is that the number of schools of the type of your school should be increased throughout the country?—Yes, I do not pretend to know sufficient about

other counties, but I only know that this type of school has met the wants of the county.

5284. Your view is that a school like yours is most likely to attract the sons of farmers?—I believe so. 30 May, 1907

5285. And to meet the wants of farmers?—Yes.

5286. The popularity of your school is on the increase?—Distinctly so. We started with 16 students, and we last year had 55, and it has been a gradual growth each year, 16, 31, 40, up to 55.

5287. You do not deal with forestry at all?—No, but we want to deal with forestry, or rather I would call it sylviculture. There was a small part of the farm set aside for planting, but the uncertainty of our tenure, not knowing whether we should come to an end for want of funds or go to another place, prevented the Committee from developing it, but there have been two reports on the subject.

5288. Your intention in the future is to teach it?—We want to teach sylviculture.

5289. Do you cultivate any fruit trees on your farm?—Yes, we have about half an acre of fruit trees. They are few in number, but they are very well selected, and selected for a particular purpose—that is, the certain types of fruit that we want to grow.

5290. You carry out spraying and the other processes, of course?—Yes, but that is small again because the whole place is small, but it is nevertheless thoroughly done.

5291. In the county your travelling horticulture instructors are probably consulted?—In that way not so much as one would like because that is only beginning to develop in the county.

5292. You consider in the future that probably that will be developed?—Yes.

5293. (*By Mr. Latham.*) Your apples and different things are part and parcel of your display at Basingstoke?—Yes, I think they are quite perfect of their kind.

Miss FAIRFULL called and examined.

5294. (*By the Chairman.*) You are the Warden of the Studley Horticultural College in Warwickshire?—I am.

5295. Will you give the Committee some evidence as to the formation and as to the objects of the college?—The college was first started as a hostel in one small house in Reading in the year 1898. It was started by Lady Warwick, who was very anxious to make girls take up agricultural and horticultural work. They had 12 students to begin with, and they took different small houses near to the original house and the girls worked at Reading College—attended lectures there. In the year 1903 they thought that they had better get one place that would hold all the students. I think at that time they had got from 20 to 30 students—it was before I came to Studley—and they then took this big place of 340 acres at Studley, which is 15 miles from Birmingham. The place is a very wooded place with lovely trees, and altogether there are

5295a 340 acres with 25 acres of pleasure grounds. Then we have a farm which is let off to a tenant, but the farmer allows our students to go up and walk round with him and learn from him about the ground, and he also allows them to go up and learn how to milk cows and the looking after of cows generally. That part I do not think is quite satisfactory as it is, and we very badly want to have our own farm buildings; it would be more satisfactory if the students had the management of the whole farm, but from lack of funds we have not been able to do that. We have had to have the farm separate and the students are allowed to go up and work there. The horticultural branch is the chief branch. Out of the 39 students that I have this term, 30 of them take up horticulture, the remaining ones are working in the poultry and in the dairy. The horticulture branch is undertaken by Mr. Iggulden, who lives in Somerset, and who lectured to them at Reading. He comes up for three days every week and lectures to our students, and we have a head gardener and a head lady gardener who superintend the work of the students.

5296. I presume the students do practical work in the garden?—Yes, they do practical work. In the summer they even get up at half past four to do grape thinning and they work on till 12, when they rest: but they are always out in the summer by half past six, and in the

winter they get out at nine, directly after breakfast, and they work on till five.

5297. The horticultural students go through a different course from the dairy students?—They go through quite a separate course, but it is very seldom that a student will come wanting to do dairy and horticulture. Occasionally they ask if they may take up the poultry, but I do not advocate that at all because the time is so limited as it is. Two or three years is barely enough for them to learn all the gardening that we have got to teach them, and so we recommend them to take up only the one subject.

5298. The full course takes two years?—Two years, but a great many of our students stay on for three, and this year I have got some who are staying on for their fourth year; they are in their fourth year now; they leave in September.

5299. The working year is of 40 weeks duration?—Yes; some years it is only 39, but many of our students, for the sake of getting further experience, like to stay on in the holidays, and they work all through the holidays. We get a great number who are willing to stay on for the greater experience and work.

5300. At the end of the two years' course, you give a certificate?—Yes, to those who get a certain percentage of marks.

5301. To those who pass a final examination?—Yes.

5302. Have you any outside examiner for that final examination?—Yes, all except our book-keeping lecturer. He gives his own papers, but otherwise they are by outside people.

5303. What does the staff of the college consist of besides yourself?—The lecturer from Frome, in Somerset, on horticulture, Mr. Iggulden; Mr. Grove, who is one of the lecturers at Birmingham University, on botany and chemistry; Mr. Long, who takes book-keeping, as we find that a very necessary subject for all those who are going to start their own market gardens, and then we have one of the ladies in the college, who very often has been through her course, as a lecturer on entomology, and, if she is good enough, we make her under for the first year, and then we make her the head of the garden.

Mr. D. T. Cowan.

30 May, 1907

Miss Fairfull.

Miss
Faithfull.
30 May, 1907

5304. That is one of your students you are referring to ?—Yes, one of our best students will work under the head man gardener that we always have.

5305. As a kind of monitor ?—Yes, and then we have Mr. Herod, who is the bee expert, to come and lecture on bees, and Mr. Palmer, who comes to take the poultry work every week.

5306. Then you have, beside, a short course of instruction lasting from six to ten weeks ; that is for another class of students ?—Yes, it is for those who do not want to take it up as a profession afterwards. I do not think, myself, that it is a very good plan having the short course, except that we very often get long course students from those who come to us for the short course ; they come, and they stay on.

5307. It is a good means of recruiting for the longer course ?—Yes, but it is not very satisfactory, as the long course students rather object to a short course student coming and getting the pick of the work. The short course students do not have the unpleasant work of wheeling barrows and the rolling of lawns, and so on.

5308. You dispense with that ?—Yes, because they have not time to do that work.

5309. They only get theoretical instruction and the lectures ?—Yes, and they also do the practical, the nicest part of the practical, the pruning, the thinning of grapes, and things like that.

5310. You have no entrance examination ?—No.

5311. How do you find your students are prepared when they come to you ?—There are very few who have any knowledge of it at all when they come to us.

5312. I mean with regard to their general education ?—As a rule, it is very good. Sometimes we get our students too young, really. I do not like them coming before they are 18 or 19. If they come before that it generally means they have not been strong enough for regular school work, and that they have come to take up gardening on account of health.

5313. Some of them have been at girls secondary schools ? Usually, I think, the greater proportion of our students have had private school teaching, or high school teaching.

5314. You also give instruction in fruit bottling and preserving ?—Yes, we have a large marketing department. The students have to learn a little bit of everything ; they have to learn how to grow every fruit we can possibly show them, and how to grow every flower. We should not know what to do with the flowers that we grow unless we had a marketing department, so that everything that is grown goes down to the marketing department to be sold. We also make jam, and we bottle fruit, so that they may learn that part of the work.

5315. Are they taught cooking ?—Yes ; I teach the cooking. I have only just started that—about a year. We find that they like that very much, and it is very useful to them, because I used to have so many complaints that the students took posts as gardeners and had their cottages given to them, and then they were at a loss to know how to manage for their housekeeping and their cooking, and so on, and they did not know how to teach any maid that they might have, or any friend to help them.

5316. Has the college any grants from the Board of Agriculture or from the County Council ?—No, none whatever, except that we did get £19 for a nature-study course that we had before I went to Studley ; I think it was in the summer of 1905 that we got that.

5317. A grant from a county council ?—Yes, for this particular nature-study course that was held in the summer holidays, but otherwise we have had nothing at all.

5318. How are the finances managed ; who is responsible for them ?—Lady Warwick is responsible for any deficiencies that there are.

5319. Practically, you may say, it is Lady Warwick's college ?—Yes.

5320. The students, I see, pay fees ranging from £80 to £120 ?—Yes, that is regulated by the size of their rooms ; some of them have cubicles, and some study-bedrooms.

5321. They are all boarders ; there are no outside students ?—We have one or two. We have one at a farm who comes and does the work, but I do not care for them so much, as I prefer to have them all in the college, if possible.

5322. There are bursary students ?—Yes, at this moment we have eight or ten bursary students.

5323. Who gives those bursaries ?—The Committee. Every term I submit the ones whom, I think, are most in need of it.

5324. You expect the full number for which there is accommodation, 51, will soon be reached ?—Yes. We are now 39, and I still have a great many applications.

5325. Are there any classes for elementary teachers in the neighbourhood ?—No, we have not had that at all.

5326. The staff of the college do not give any lectures in the county ?—A lady who is there under Mr. Herod helps with the bees and gives practical demonstrations, and there is another lady who gives entomological lectures. Whenever they can they take extra lectures, if they are good enough—the heads of the departments who have been students and who have worked up, but there are always the outside men lecturers.

5327. They are invited to give lectures outside ?—No, the men lecturers are invited to come in every week, and the ladies who are capable of lecturing lecture as well in the college.

5328. I see you have given us a classification of those who attended the nature study course ?—Yes, that was for one year. In that statement I have not made any mention of what our students have done since they left us. I can give you one or two particulars of those, if you would like them.

5329. By all means ?—There are about 50 who have done really well since they left. Miss Crooke has been before you ; she was one of our students. Miss La Mothe took up dairy work and poultry and bees, and has been doing very good work. Miss Hoare (now Mrs. Benson) was a very good student, and she has been appointed Assistant-Instructress at the British Dairy Institute at Reading. The Misses Murray are farming in South Africa and doing well ; Miss Dawson is working her own garden ; Miss Wheeler, who has her own market gardens and students, is doing well ; Miss Millard, her own garden and bees ; Miss Batchelor, who has gone to Canada is doing very good dairy work ; Miss Yates, who was a student at Reading is now a poultry manager in Canada, and was also manager of the Utility Poultry Laying Competition that we had at Studley—they have it every year in different places, and she was appointed as manager. Then there are the Misses Bidwell, who have a garden of their own ; Miss Grundy, who keeps poultry of her own and does a good trade ; Miss Hibbert, a jobbing gardener ; the Misses Hughes, Jones and Peers, who have a market garden and students and a jam factory quite close to Newbury ; Miss Mirrell, assistant in the dairy at Studley, who has gone to take up dairy work and who was a very good student ; Miss Swindale, who had been head gardener in a big house, I do not remember the name of the gentleman she was with, but she had five men working under her, and did satisfactory work ; she has just got a new post at Godalming ; the Misses Goddard, who went to South Africa ; the Misses Haig, who have got a splendid market garden at Maidenhead.

5330. Are the market gardens that are kept by the students you have mentioned paying ?—Yes, very well indeed. Then there is also Miss Tate, who is a gold medallist of the Royal Horticultural Society ; Miss Slack, who went to Sumatra and started dairying ; Miss Woolcombe, who is a gardener ; Miss Partington, who is doing her own dairy work ; Miss Colson, who is a County Council Lecturer ; I think she was doing that for two years, and I believe she was doing very satisfactory work. Then there is Miss Rix, who has been appointed bee expert to the Cumberland Bee-Keepers' Association. Those are a few of those who have done very well. Then there are a good many who go as under gardeners and as gardeners perhaps with one man or a boy under them.

5331. Are there any daughters of farmers amongst the girls at the college ?—I think we only have one at this moment.

5332. I see an application has been made to the Board of Education for the establishment of a scheme for the future regulation of the college ?—Yes, we wish to get the college on a more permanent basis, and we felt that it ought not to be in the hands of one person really, as it has been hitherto, and we wished to have it recognised if we could.

5333. The Board have consented to formulate a scheme as soon as arrangements have been made for the grant of a lease of the premises to a body of trustees in trust for the purpose of the college ?—Yes.

5334. A body of trustees has been appointed ?—Yes.

5335. The lease I see has been practically arranged ?—Yes.

5336. And will be executed shortly ?—Yes.

Miss
Faithfull.

30 May. 1907

5337. You would like the college to be entirely under its own management and have its own farm?—Yes, that is what we would like.

5338. Chiefly for dairying?—We have a dairy absolutely complete.

5339. The farm then would be for other purposes?—What we really want is the management of our own cows; that is the real point.

5340. It would be in connection with the dairy?—Yes.

5341. You do not want an arable farm, of course?—No.

5342. You wish to have the cows under your own control, and have your own milk instead of buying the milk as you do now? I suppose now you buy the milk from the farmer?—We buy the milk from our own farmer, yes. We are just going to put up a laundry now, as we have had several requests for the domestic economy branch entirely, not only the cooking part of it, but they want to learn housekeeping and account keeping and laundry work, I think chiefly to fit students for colonial life. They want to go in first of all for gardening and then to go on to the domestic economy branch, and my idea was that we should have our own laundry, and we are going to start that in September if we can.

5343. You would like to give the domestic economy branch the fullest development?—Yes.

5344. (*By Mr. Latham.*) If you have only one farmer's daughter at the college, from what class are your other students principally drawn?—Chiefly clergymen's daughters, doctors' daughters, and some daughters of wealthy people who want to manage their own gardens and their own farms. Occasionally we get Americans who come over to learn and who intend to go back to their own country. There were three girls who came over last year who had their own poultry farms out there, and they wanted to learn how to manage them for themselves.

5345. You spoke of your students' work on the farm. What manual labour do you expect these ladies to do on the farm?—We expect them to dig, we expect them certainly to attend to the cows, and do everything that is necessary.

5346. Milk the cows?—Certainly, they do that.

5347. Continuously?—Oh, yes. A new student who came this term has been up every day regularly to learn to milk.

5348. They do not take any regular service, do they—do they go twice a day, night and morning?—Yes, and they take posts afterwards in which they would have to do the work.

5349. What sort of wages do you find them capable of taking afterwards?—From £40 to £60 a year, not more.

5350. Can you give any illustration of any that are managing dairies like that and doing their own milking?—Yes, there is a Miss Batchelor, who has gone to Canada to a very good dairy; I have not got a note here of the wages she is getting. Then there is Miss Blenkinson, who had charge for many years of a large dairy.

5351. I am more concerned about this manual labour. The work is rather menial, is it not?—I do not think they find that. In gardening they do everything.

5352. I am referring to agriculture. I am an agriculturist myself, and my experience is that we cannot get women to milk, and you would be very valuable to us if you say you can even get ladies to milk?—Yes, I do not think they mind it at all—I must say I have not time to go up every day myself now, but I certainly learned it myself.

5353. What is your idea of this little model farm which you would like to have?—I think it is a mistake that the students should not see when the cow is ill and so on. At present they see the cows only when they milk them, and when they are walking round the farms with the farmers and when they are going to demonstrations at the various farms, and I want them to be able to do everything for themselves, to know how to look after a cow just as they would if they had their own horses. In that case they would superintend everything, and I think they ought to know everything about the cows.

5354. You are really anxious for them to do everything—to feed the cows, to milk them, to clean them out and do the various things that we find difficulty in even getting men to do?—Yes, just as with the poultry.

5355. But it is a much more derogatory work in the case of the bigger animals, in fact I scarcely think it is a woman's job at all. We will now go to horticulture. Does that include every branch?—Yes, every branch I think.

5356. They are taught grafting and pruning and digging and grading and packing?—Everything. The packing they need not take up unless they like—that comes into the marketing department, and they only go there if they wish to take up that branch.

5357. But packing, you know, is so very important. When Miss Crooke was before us she seemed inclined to evade that question. As you know, probably, we have our fruit very much worse packed than the foreigner packs them; for instance, you never see our apples packed like the foreign apples are packed when they come to England?—No, but the difficulty is that if we put students on to pack we probably should not get our orders done properly, but if they go into the marketing department for a regular course, as a great many of them do, then they watch the packers, and learn gradually how to do it themselves. If we were to put them on to pruning trees and that sort of thing they would probably spoil the trees, and it would be a little difficult if we were to put a class of say 30 on to packing peaches, for instance.

5358. I suppose you know peaches that are badly packed are almost unmarketable, just as butter which is badly packed is practically unmarketable?—Yes.

5359. I am disappointed that you and Miss Crooke do not place more value on the packing system?—I do think it is most important, but I think it is a branch that ought to come by itself, I mean by that for the students who are only going home to do private work it is hardly necessary for them to learn to pack fruit. Those who are going in for market gardens would naturally go through our packing department, and they would learn it.

5360. Yes, I see you have a marketing department. You made a remark just now that you had to dispose of your produce by sale. Let us go to plants and leave fruit alone. Do not flowers want careful packing?—Yes, very careful packing.

5361. Are they taught to pack flowers?—Yes, certainly.

5362. Then in that case it would be only introducing a little more finality if you were to teach them the fruit packing as well. I used to be much in Covent Garden many years ago, and the beautiful way that foreign fruit was packed there showed how far behind we were in our business, and I think if you are going in for finality, the careful teaching of the packing of every article, from the highest to the lowest, should be the first consideration?—Yes.

5363. Can you give us some information as to what you do in the way of preserving fruit?—We do a great deal in the way of jam making. We have been supplying the Elder Dempster line every week with their jam, generally 9 to 12 dozen jars every week for their different ships.

5364. I see you have a marmalade and jam factory. I presume they are fitted with all the necessary appliances?—Yes, and the students go into that department a fortnight at a time, and learn how to make jam and to bottle fruit.

5365. I suppose all this jam and marmalade is properly packed and covered in, and that sort of thing?—Yes.

5366. That is very necessary instruction?—Yes, only there is not a great deal of time for everything. They come for a fortnight and they learn exactly how to make jam, and if they are there for two years they would come for a fortnight in each term, and in that time of course they can do a great deal.

5367. It is a shorter course?—Shorter course.

5368. With regard to your poultry management, will you just explain how far you go with that?—We have about 500 I think now with our small chickens. We rear ducks also—

5369. I do not care what you do, if you will tell as what the management is. Do you do it by incubators?—Yes, by incubators and also by sittings as well. We have Mr. Palmer once a week to come and go round the whole of our stock and then we have a very capable teacher who takes the practical work when Mr. Palmer is not there.

5370. Do you go thoroughly through that from beginning to end?—Yes, absolutely, they do everything for themselves, they even kill.

5371. Do they cram and kill and bone?—Yes.

5372. And prepare for table?—Yes; they have the option of whether they kill or not, but otherwise they do everything.

5373. Packing for market?—No.

Miss
Faithfull.
30 May, 1907

5374. Then again that is the most important thing of all others, and you seem to me to leave out from your ladies' point of view, and Miss Crooke admitted the same, the most important thing, namely, the packing. Poultry sent to Leadenhall Market is absolutely useless if it is not properly packed?—But you see five of the students we have now will be going home to manage their own home poultry farms, and they will not want to learn packing. The other two would say to us, "We want to learn packing," and they would learn it: they would then go into our marketing department to learn that.

5375. Why may not the other five want to learn it as well?—I repeat, if they are going to manage their own farms they do not need it.

5376. But they will never have anything to manage if they do not breed enough to sell, and if they breed enough to sell they will always have to pack them and market them, so the knowledge is necessary for them. As a very large producer of poultry I am rather strong in my argument that I think you are making a serious mistake in not carrying it to a finality. I know as well as possible that if you open a box of peaches in a gentleman's house almost immediately the lady will say, "How splendidly they are packed," and that applies to every article in the way of horticulture and also in the way of dairying. The better butter looks when it is opened the higher the price it commands. All butter that comes from abroad is most beautifully graded and packed, and the same with fowls. All the fowls in Leadenhall Market that come from abroad are sent there packed in a proper way. Of course, they come from a long distance, and they are obliged to be properly packed, and I strongly advise you, if I may do such a thing, that the packing of all your articles is one of the most important things that you can possibly have to do?—Yes; I am obliged to you.

5377. To what extent do you go in for bee keeping?—We have 15 or 16 hives, and we have two to three days instruction, and divide our students into juniors and seniors for the bee demonstrations and lectures.

5378. I suppose you get your students quite expert in the way of driving bees, and that sort of thing?—Yes, they go in thoroughly for the examinations.

5379. Just let us go a little more into this, because it is rather important. Do they hive and drive the bees and extract the honey, and so on?—Yes, everything.

5380. Then with regard to bees, you do really have the whole finality—to the honey?—Yes, certainly.

5381. You finish that off?—Yes.

5382. Of course, you are expecting to keep your students up to a very high class of the present time, because your fees are almost prohibitive for anyone in a lower state of life?—They are.

5383. That is rather your anxiety, is it, to confine it to the higher classes?—I think so, certainly.

5384. Are these bursary students nominated by certain bodies?—No, a student would apply to me and I should take up her case first and then report to the Committee who I thought each term would be most worthy of a bursary.

5385. Who are these students who are nominated by the several county councils?—For the nature study course, do you mean?

5386. Yes. They pay something, do they not?—I really do not know, that was before I came to the college; they had that course in August, and I came in September.

5387. You say the Board of Education were favourably impressed with your application for the establishment of the scheme as to the future regulation of the college?—Yes.

5388. And that something will be done. Do you know at all what is likely to be done?—I hope they are taking over the college and appointing trustees.

5389. They are taking this over?—That is what we hope; we want something done to get the college on a more permanent basis.

5390. I should like to know what you do at shows in the way of exhibits to show what you are doing. Do you do anything in that way?—Yes. We send up regularly every year to the Temple Show, generally a vegetable exhibit. In 1902 we won the Royal Horticultural Society's Silver Banksian Medal for bottled fruit and vegetables. At

the Crystal Palace Fruit Show we won the third prize for bottled fruit, and prizes for poultry at the Reading Ornithological Show. In 1901 we won the Silver Banksian R. H. S. Medal for bottled fruit again. In 1903 we won the Gold Medal of the R. H. S. at Chiswick for bottled fruit. In 1904 we won the Silver Banksian Medal at the Temple Show of the R. H. S. for vegetables. We won, in that same year, the Silver Banksian Medal at the Birmingham Show for bottled fruits and jellies, etc., and the Gold Knightian R. H. S. at the Temple Show for vegetables. In 1905 we got a medal for an exhibit we put up at Birmingham for flowers and bottled fruit, and in 1906 we got prizes for dairy work at the Nuneaton Show. We also got the first prize at the Birmingham Show for grapes, the third prize at the same show for chrysanthemums and the second prize at the Temple Show for grapes. That was last year, which was our first year with grapes at a show at all.

5391. I wished to draw from you how far you were keeping those up and to what extent you were successful. I presume you have taken prizes for several of these exhibits?—They are almost all medals, not prizes.

5392. (By Dr. Somerville.) Have you a magazine in connection with the school?—Yes, *The Studley College Agricultural Journal*.

5393. Have you got an Old Students' Association that keeps you in touch with past students?—Yes, we have a guild.

5394. (Mr. Medd.) I think you made some remark to Lord Reay about the lecturers. Do any ladies from outside come to lecture at the college at Studley?—No, I do not think we have any lady lecturers from outside.

5395. Do your lecturers give lectures outside?—Yes.

5396. By whom are they employed?—Last year, for instance, there was a school at the other side of Birmingham, the head mistress of which asked if I had any student who was good enough to go and lecture to her girls. I sent her one of our students, and she was so satisfactory that, after she left us, they took her on there to regularly lecture for a month at a time.

5397. (By the Chairman.) You mean she gave lectures while she was still a student with you?—Yes.

5398. And she was so good that they retained her after she left you?—Yes.

5399. (By Mr. Medd.) With regard to the question of packing, it is very difficult to combine a business and an educational establishment, is it not?—Yes.

5400. When pupils are learning, a great quantity of the materials is spoiled, necessarily, and if you entrusted all the packing of delicate fruits like strawberries and grapes, and so on, to students, a large quantity of it would inevitably be spoilt?—Yes.

5401. In the absence of Government aid you cannot afford to incur that loss, and, therefore, you are bound to employ professional packers?—Yes.

5402. If you had more aid from the Government or from the local authorities, you would be able to dispense with that necessity, or, at least, you would be able to give more instruction in packing to the students themselves?—Yes.

5403. As Mr. Latham said the success of poultry keeping and fruit growing depends ultimately upon proper grading and packing of the produce?—Yes.

5404. Those things are only neglected at a place like Studley because you cannot afford to entrust the whole of it to students for the reason that a large quantity of the material would be spoilt?—That is really so.

5405. With regard to the future of the college, the college is placed under a scheme approved by the Board of Education, because the Board of Agriculture is not a body competent to do such a thing?—I do not know that.

5406. Lady Warwick transfers her rights in the college to a body of trustees?—Yes.

5407. I believe she has made a free gift of all the fixtures, stock and furniture?—Yes.

5408. In future the college will be maintained as a public institution?—That is so.

5409. Under a Government scheme?—Yes.

5410. There is only one other thing; I am sure you would be glad if any member of the Committee would visit and inspect the college before their report is drawn up?—I should be delighted to see anybody there.

Mr. T. H. WARREN, Vice-Chancellor of Oxford and President of Magdalen College, called and examined.

5411a 5411b 5411c (By the Chairman.) The Committee would be very pleased if the Vice-Chancellor of the University of Oxford would tell them what their plans are with regard to the advancement of agricultural education?—I think we stand at this moment and at this day in a very interesting relation. I think, possibly in a week's time I might have been able to say a little more in some ways than I can say now, because what has really changed the aspect of affairs in Oxford more than anything else is the advent of my friend on my right, our distinguished Professor, Professor Somerville, and in two ways, partly in what his appointment means and partly in what we hope he may do for us himself. His appointment means this, that one of the colleges, which is among the richest in income, and is one which holds a specially strong position in regard to agricultural land, and especially as an owner of agricultural and woodland round and about Oxford, has taken up in a serious and practical way the question of agriculture. We had, as you know, and as many know, an old-fashioned professorship called by an old-fashioned name, the Professorship of Rural Economy. That was held by various distinguished people, but the income attaching to it, never large, fell off and declined, and the professorship was for some time, you may say, quite in abeyance, merged in the Professorship of Botany; and, then, when it was revived it could only be revived in a partial and intermittent way. The system which was adopted was that of accumulating a moderate sum, and then appointing a professor for a short time. Under that arrangement we enjoyed the lectures of Sir Joseph Gilbert and of Mr. Warrington, and, of course, I need not say they were eminently scientific and valuable; but they did not produce a steady effect or attract students from the University, but now St. John's College has taken up the professorship seriously, has endowed it with a Fellowship and with a considerable subvention, and we have an experienced and able and practical man filling it, and we have every hope that everything that can be done for us he will do. I and many both inside and outside Oxford have felt that Oxford ought certainly to be one of the universities which should have a strong and working Agricultural Chair and Agricultural Department, and for various reasons. In the first place, of course, a very large part of the sons of the landed gentry, both small and great, have come for many centuries to Oxford, and many of these have to look to land either directly or indirectly as the chief occupation of their lives, and the source of their income; and then there are others who may become agents for them, and who are brought into connection with them, so that there is a natural interest both theoretical and practical which ought to centre in Oxford. Then, again, the colleges, as you all know, are many of them considerable holders of landed property. The college I have just spoken of is one. My own college, Christ Church, All Souls, and New College are large owners of landed property. Most of them have property beside their own property in and around Oxford over which they could exercise control and make available for the purposes of study or experiment. The colleges are influenced partly by the general waking up of the country to the value of science as applied to agriculture, and partly by the increasing stress of competition. Colleges are, I think, keen both on scientific grounds and on practical grounds to see their property improved by the applied science of agriculture. I have spoken of St. John's, and I might mention that my own college at the same time, or about the same time, has spent a moderate sum of money, about £600, in starting a sort of forest garden, or arboretum upon our own property at Tubney, not very far from the college. That brings me to another important point, and that is the advent of the Forestry School. I hope it may be expected, whatever happens, that the Forestry School to some extent may remain at Oxford. I should not wish to say anything prejudicial to the interests of Cambridge, and I have already said that if those who have had the charge of the Forestry School think well to establish a Forestry School at Cambridge that will be for them to say, but I hope the Forestry School now established at Oxford will remain, and will be a strong school. It has only been there about two years, but already it has taken root and is doing very well, and a large number of students are working there and are working hard. They are a nucleus of scientific students who have every incentive and every reason for working at their professional career. That again, I think, has brought home the opportunity and the possibilities of applied science both to the senior and to the junior members of the University. I have spoken of the general movement of the society, which I think is

hopeful, but in particular, as I am sure you would understand, Lord Reay, there is more understanding of the value of what is called post-graduate or graduate study of research. It is recognised that while there ought to be a good general education, a common basis if possible of education, provision must be made for specialism in various directions and in particular that some kind of reconciliation of what may be called professional or technical education, and science, science and general education, must be brought about, and that it is for the universities to bring it about; that they ought to set themselves to teach the scientific aspects and the scientific sides of professional and technical education. An immense work has been done in medicine in Oxford. I say immense, for it may not seem even now very much in numbers, but it is really an immense movement if you compare Oxford with what it was 30 years ago with what it is now, and the same kind of thing is taking place all over the field, and one of the ways in which the University sets itself to do this is by means of diplomas. We have now diplomas already established in a variety of subjects—in Geography, which is doing very well, in Economics, which is beginning to do well; in Mining and Engineering, which is only just begun; and I think we might without much difficulty persuade the University, with every encouragement from many sources, to start a diploma in Agriculture. That would be one of the fairly easy and promising ways, I think, of encouraging agriculture. For all those reasons I think there is an additional opportunity now and more possibility of promise than there has ever been before. Then again I think our friends from outside—the old members of the University, who are, I hope, beginning to take more interest in the University and to believe in it more, are inclined to encourage amongst other studies the study of agriculture. I know one gentleman at any rate, of considerable means in the neighbourhood is very keen to see this done, and he has already given practical evidence—I do not know that he would wish himself quoted by name at present—of his desire to support the widening of the Oxford curriculum by contributing a considerable sum, and I hope his example may be followed. In the appeal which Lord Curzon, our new Chancellor, and myself put out the other day, agriculture was one of the subjects mentioned by name and put in a leading position. I think those are the main factors of the situation, but perhaps I might now come to the reason why I speak of this exact moment as I do. Professor Somerville gave at his first term last year a very interesting lecture. He has now followed that up by presenting a memorandum to the Hebdomadal Council of the University. Only last Monday it came before us, and the Hebdomadal Council at once appointed a small but strong committee which was to work with Professor Somerville and go into the question, and I hope we shall meet next week and make a beginning and see what can be done, and I feel confident that we shall have the support of a good many in the University, and that we shall have the support of the colleges. There is only one other point which it occurs to me to speak about—I hope, of course, that you will ask me any questions that occur to you, and I will endeavour to answer them to the best of my ability—and that is about Reading College. I have not a great knowledge of the working of Reading; it so happens that I have not been personally much in contact with it, but I have every reason to believe, in fact it is a matter of common knowledge, that they have done very well, I do not think that their good work really at all cuts the ground from under the University of Oxford, or precludes the possibility or desirability of Oxford acting for itself. You must remember that there are a large number of students, especially those of the kind that I have spoken of, who will come to Oxford partly from family tradition, partly on account of their previous education, largely because they wish to get their education side by side with their comrades who are going into other lines, and who naturally come to Oxford and who will not go to Reading, do what you will. It is no discredit to Reading at all. Reading serves a most useful purpose, and we are very glad to help them in any way we can, but these students will not be induced to go to Reading; if they cannot get agricultural instruction at Oxford, they will after they leave Oxford, seek it elsewhere, and will be more likely to go to a distance than seek it at Reading. Then of course, Oxford has many advantages and opportunities in its larger scientific system which a university college like Reading, however it might develop, and although in some few particulars might do even better,

Mr. T. H.
Warren.

30 May, 1907

cannot expect to obtain. At one time I was inclined to think that perhaps we ought to let Reading try its experiment. I think to a certain extent Reading has tried its experiment, and tried it with a good deal of success, but I do not think we need, out of consideration for Reading, or with regard to what it is doing, hang back or hold our hands. I do not know that I have anything more to advance.

5412. Are the students in the Forestry Department matriculated students?—They may be divided into two kinds. For Forestry there is this diploma of which I have spoken—and I am glad you have asked that question, because it raises a point about which I think I ought to speak and make it clear. The essence of these diplomas is that they stand just outside the degree system. It is not necessary in order to gain a diploma to go through the same curriculum exactly as the degree. You may take the degree and the diploma as well, or you may take the diploma without the degree, and if you take the diploma without the degree, then a knowledge of Greek, for instance, is not necessarily required, and several other conditions of residence and so on are not nearly so strict, and when you ask, my lord, if they are matriculated students in the ordinary sense of the word, those who take the degree are matriculated students. The diploma is open to those who matriculate for the purpose of the diploma alone, and it is also open to students under certain conditions from outside who do not matriculate, but the bulk of them may be called matriculated students, and the majority of them are persons who not only take the diploma, but also take the degree. The Forestry students, it is hoped, and I think we see that it is so, are taking honours in some scientific school, e.g. in Geology and in Botany as well, or if they do not do that they take the ordinary pass degree, that they are certainly matriculated students, and most of the others, indeed the Forestry students you may say are roughly all matriculated students, although not all degree students.

5413. The school is accessible to those who are not degree students?—Yes.

5414. They have an entrance examination, I suppose?—Yes, they have an entrance examination of their own. The diploma is administered by a committee which prescribes what conditions it thinks fit. I ought perhaps to say that the diploma is a new one, and these arrangements are still under consideration; they have not been finally settled, and I think it is probable that they will be rather enlarged.

5415. Has a diploma in agriculture been instituted already?—No, it has not been instituted. I think it is probable that a diploma in agriculture will be instituted, and that the majority of students who take it would take a degree as well. I should hope so, and I should think that is what the University would aim at.

5416. You have not considered the question yet of having a farm for the purposes of the agricultural department?—No we have not got as far as that yet.

5417. Although, as you have said, the colleges, being owners of the necessary property, there would be no difficulty, whatever, in obtaining the necessary object lesson in the way of farms?—No, I do not think there would.

5418. I suppose you have a Chair of Biology at Oxford? In the old days, as you, Lord Reay, will, at any rate, understand, all these things were united in one—the Linacre Professorship—which included Physiology and Zoology and Anatomy. Now we have Physiology, which is one thing, and we have Anatomy, a separate thing. We only the other day established a Professorship of Anatomy, and we have a large department of Comparative Anatomy, or Zoology, which includes the study of animals of every kind, and that—again, has become very much strengthened and sub-divided. For instance, as Professor Somerville will tell you, Entomology is now being taught in connection with Forestry. We have, beside the Professor of Entomology, also called a Professor of Zoology, and a very splendid entomological collection, so that on that side we are strong. Again, Geology has grown enormously in the last two or three years. We have a very energetic and capable professor, and the University voted, only last Monday, £600 to put a new story on his department to find accommodation for his increasing students.

5419. (*By Mr. Acland.*) Do you think with development there would be a considerable proportion of those who are going to be, probably, landlords or land agents willing to take a course in agriculture?—Yes—I should not like to be too sanguine about that, because I think that a good many of them will take the ordinary education, and then, perhaps,

for one reason or another, will be satisfied with that, but, even making allowances for their wishing to get into life, or for other reasons, I still think, if agriculture were there, and the opportunity were given, a fair number of them would take it up.

5420. Do not you think that their taking it up depends very largely on their being able to get a degree through the study of it?—Yes, I think, that if it can be made part of the Degree Course for the Pass Degree, that would, in my opinion, be a distinct help.

5421. Would you not be in favour of making agriculture in the same way as you make Chemistry, an Honour Degree Course?—I should not like to say about that. I really do not think I ought to offer an opinion about that. I have not heard sufficient about it, really, as to what it would mean, or how it works elsewhere, and I do not think I should like to give an opinion about that.

5422. Could not you give an opinion, seeing, for the moment, that it is advisable, educationally, to have such a course, as to whether the existence of a Degree Course in agriculture would not materially increase the number of students who would be likely to take it?—Speaking off-hand, I am not inclined to think—this is only an off-hand opinion—that creating a separate school in Agriculture, ranking, we will say, with Botany or Geology or Chemistry, would be very attractive. I think you will find, for instance, that the great number of these young gentlemen I have spoken of take the History Course. They come from Eton, or Winchester, or Rugby, or wherever it may be, and when they come up the thing which they naturally take is History.

5423. My experience is, from having taken the History Course at Oxford, that the reason people take it is because it is supposed to be the easiest course to get a Degree in, combined with a certain amount of interest?—Yes.

5424. Would you agree with me that there are a considerable number of persons, particularly of the class you refer to, who come up to Oxford in order, primarily, to have a good time, and, secondly, to get a Degree in some course which has a certain amount of interest combined with it?—Yes, I think I would agree to that.

5425. Do you not think that a good educational course combining a considerable amount of the different sciences you have mentioned, could be devised which would attract by its interest, and which, also, would be a sound educational course?—If you mean in the same way that the History School attracts, I am not quite sure that I should say that. I think I should, like a Scotchman, rather ask another question, although I am not a Scotchman. Why do these people prefer History now, and why do not they take Botany or Chemistry or Zoology, which is open to them, and would not the same reasons which stand in the way of their doing that, stand in the way of their taking Agriculture?

5426. If I am in order in answering, I should say the study of any one of those particular sciences would take them very much further into the details of one single science than would be of any use to them in their after lives, and if there was a course which was quite satisfactory, from the educational point of view, and yet included such an amount of knowledge of those sciences as would be of real interest and use to them in any connection they might have with land, I ask you whether you do not think they would be much more inclined to take a course combining those sciences than to take a single detailed course in any one particular science?—I think that might be so. I think if Agriculture included a certain amount of Economics, and, perhaps, some amount of Law, and that kind of thing, it then would include elements of interest which the physical sciences alone do not include, but it is not easy to make an Honour Course very various. I think that it would be quite easy to put Agriculture into the Pass Course, which is, as you know, various. A student takes a pass, we will say, in Modern Languages and in Mathematics, or one group of science, and if he was to take Economics as one group and Agriculture as another group, and possibly, Modern Languages as another, I think that might be an easy thing to do, but I should not like, off-hand, to say that I think a course for Honours alone in Agriculture could be arranged which would be at once attractive by its general interest and also scientific. That is, rather, what I am afraid of saying.

5427. Do you agree that a course could be made an Honour Course which would be attractive? Is your fear rather that it would be against the principle of Honour Courses to permit such a course at Oxford?—I think my fear is that it would be a little against the principle of Honour Courses to try to make it too various.

5428. Do you rather agree with me that if such a various

course did exist it might be popular with the class which is likely to be connected with land?—Yes, I think it might. Of course the people who combine the literary and the scientific gifts are a limited class.

5429. (*By Mr. Latham.*) Where do you expect to get the students or undergraduates from to come to this course?—I should expect them to be drawn to a certain extent from the existing students who take other courses at present, and then from others who would come, who do not now come because there is no special opportunity in Agriculture.

5430. And cannot afford to come, I presume?—No, not only cannot afford to come in the strict sense of the word, but who do not think it worth while to come.

5431. Would they have the opportunity of coming by scholarships from other institutions? I cannot exactly see how the class that we should like to assist would manage to come any better than they do now?—You mean the sons of farmers of moderate means, and so on?

5432. Yes.—No. I think they would require scholarships. Of course, the expense differs very much. They could come as non-collegiate students, not live in the college, but come as students of the University at a very moderate rate.

5433. That is one question I was going to ask, whether they would have the opportunity of residing or not residing?—They would have to reside, but if they only came for the diploma I am not sure they would have to reside at all; at any rate, they would have only to reside for a short time.

5434. I presume as a matter of fact that the line is hardly defined yet?—No.

5435. Would Reading have an opportunity of sending to Oxford by scholarships?—I should think so.

5436. Do you think an unlimited number would be likely to come?—No, I do not think so. At any rate it would be some time before it reached any very large numbers.

5437. Can you say at all what would be the expense of a course there?—Of course, with regard to all these scientific courses the experience is that they are rather costly in themselves. The laboratory fees are considerable. A Forestry student pays a good deal more, and so does an ordinary student of Science or of Medicine, than a student of Latin or Greek or History.

5438. (*By Dr. Somerville.*) You are a member, are you not, of the Consultative Committee of the Board of Education?—I was, but I have ceased to be. When I became Vice-Chancellor I was obliged to resign, but I succeeded Sir William Anson for two or three years.

5439. You are quite familiar with the work the Board of Education is doing and with the general tendency of educational administration in the country?—Yes.

5440. I suppose the Committee may take it there is a greater and greater tendency towards the decentralisation of education is there not, that is to say that the county councils are being charged with greater powers?—Yes, certainly.

5441. I suppose the Committee may also take it that a considerable number of young men that pass through Oxford ultimately take their fair share of county work?—Yes.

5442. And will, in due course, I suppose, be called upon to assist in the administration of local educational schemes?—Yes, that is quite true.

5443. Living as they do in the country, I suppose that education in the direction of rural requirements is likely to be of quite as much importance to them as education of a more classical character?—I think so.

5444. Do you think there would be any particular advantage in offering to those young men when they are at Oxford the opportunities of becoming acquainted with methods of agricultural education and with the methods of agricultural experimentalisation and demonstration?—I certainly do. I think if Oxford, or Cambridge either, give these young men who are likely to be to a certain extent prominent, and leaders in their own district, more of a scientific outlook and an idea of what may and can be done through applied science, that that would be a very good thing.

5445. I think from what you have said, the Committee need have no doubts at all about Oxford being thoroughly well equipped as regards the power of supplying education in the sciences that are fundamental to agriculture?—No,

I think they need have no fear about that; that is a point that I feel confident upon. I think that there are one or two points. Chemistry, for instance, especially Organic Chemistry, requires in my opinion further development, but I think that will very soon come.

5446. So that to provide a well equipped agricultural department, it really only requires the addition of teachers in the sciences as applied to agriculture?—Yes, I think so.

5447. You of course cannot be expected to forecast the probable numbers that would frequent an agricultural department?—No, that is very difficult to say I think.

5448. But perhaps you may agree with the suggestion that I make that the numbers in the agricultural department of a university should not be strictly compared with the numbers, we will say, in a provincial agricultural college; that is to say that the ultimate influence of a small number of agricultural students in a university is likely to be very much greater than the influence of a similar number in a provincial institution?—Yes, I should agree with that.

5449. In other words the men who will pass through a university course are likely, to a large extent, to become teachers, lecturers, and demonstrators?—Yes, I agree with all that.

5450. I suppose there is no particular reason for thinking that the number who might frequent an agricultural department in Oxford would be inferior to the number requesting the corresponding Department of Cambridge?—No. What is true of one is true of the other; there may be little differences, but on the whole you can almost always argue from one to the other.

5451. I suppose also in Oxford, as in Cambridge, education alone would not be the sole function of the department, but probably the workers in that department might take their fair share in advancing agriculture along the line of research?—I should certainly hope so.

5452. You have already been asked some questions with regard to the cost of living in Oxford. Do you think it is conceivable that a non-collegiate student who would endeavour to economise and live in a careful way might get through the academic year on under £150?—Including his fees?

5453. Yes—I have no doubt about that.

5454. (*By Mr. Medd.*) Have you formed any idea yet of the probable cost of establishing the agricultural department?—No, I can hardly say that I have. Anything that I know I think has been rather suggested to me by Professor Somerville; I have not really gone into it.

5455. Or the cost of maintaining it?—No; there again I do not think that I could give an opinion of my own.

5456. What available financial resources have you for the purpose?—Of course the teachers would be paid in this sort of way—there is the professor, who is endowed, and I should hope that the University in some way or other would pay a demonstrator or assistant. If he were a man of distinction, a college might, perhaps, give him a Fellowship in payment, or probably in part payment. If you had a good demonstrator, and it became very necessary to retain him, and it was a question of his stipend being increased, it is quite possible that a college might come to his assistance with a Fellowship. Then there would be the need of a departmental grant; that is generally made by the University either out of its ordinary resources or for a time through what is called the Common University Fund, but ultimately from the resources of the University. Then in reduction of these expenses of the University comes the fees. At first the fees would be very small. The students would be a handful, but if the students increased, and became any number from 25 to 50, we will say, the fees would then become a very considerable source of income, and they would go in reduction of expenses. Then I suppose we should hope to get some assistance, as other institutions have had in a matter of this kind, from the Board of Agriculture, and of course if we made ourselves a centre for any county or number of counties, it is possible that they might give some assistance, though I suppose they would be more likely to give it in the way of scholarships than in any other way, and so in that case the assistance would only come to us in the form of fees.

5457. You have no endowment at Oxford that could in future be applied in this direction which has not been used to the best advantage hitherto?—No, I do not think so. Of course, you understand that the colleges are different from the University; the colleges within certain limits

Mr. T. H.
Warren.

30 May, 1907

Mr. T. H.
Warren.
30 May, 1907

control their own property. There are one or two colleges which are charged with assisting the university in special ways. All the colleges have to contribute by a sort of system of graduated income tax to the University, but some of the colleges have special funds over which they have control and can say, "We should like our contribution to go to agriculture," or "We should like it to go to engineering," or "We should like it to go to geology," or whatever they might choose, and I think it is possible that some of the colleges might be inclined to give a preference to agriculture.

5458. I merely make the remark now, because the Board of Agriculture make it a condition of giving any grant that there shall be a corresponding local contribution?—Yes.

5459. And of course every day it becomes more and more difficult to get contributions from local authorities?—Yes.

5460. For instance, the total expenditure at Cambridge is between £3,000 and £4,000 a year. Of course they have contributions from adjoining counties. I believe a few years ago Mr. Martin Sutton made an offer to the University of an endowment corresponding to Sir Walter Gilbey's at Cambridge, did he not?—I believe he did. I was not in the University Council at that time, and I did not hear the details, so I do not know exactly what it was.

5461. You would probably approach him again when the scheme had become more matured?—I should think we very likely should.

5462. He was giving evidence here the other day and spoke with the greatest interest and approval of the idea of an agricultural department at Oxford, and he seemed disposed to make a renewal of his previous offer. If you are in favour of the formation of an agricultural department, would you wish certain counties to be affiliated to you, and certain schools and colleges, as they are at Cambridge?—Yes, I think we should.

5463. And you would desire that the agricultural education within that area should be completely organised, looking to you as the head and chief centre?—Yes, if they were willing I think we should like that.

5464. With regard to the question of degrees, you insist upon residence for a degree?—Yes. May I say this? We insist on residence for all degrees, but there are now the degrees of Bachelor of Science and Bachelor of Literature for which the residence is considerably less, and for the Arts degree—I do not know whether that is of much importance.

5465. Yes. What is the minimum period of residence?—It would be something like two years, but it could be further reduced by residing in the vacation.

5466. In the case of Lampeter, Lampeter is affiliated to you?—Yes.

5467. You do not consider a student at Lampeter is a student at Oxford?—No, but of course the time put in at Lampeter counts at Oxford and knocks off, to use a vulgar expression, a certain amount of time.

5468. A student at Lampeter would have to come to you for two years?—Yes, quite so.

5469. In the event of Reading being affiliated to Oxford, the Reading student would have to come there and reside for the Oxford diploma?—I would not say necessarily for a diploma, but for a degree he would.

5470. The point should be considered, if I may say so, because at present the Reading students go to London, and of course it is very much to their advantage to obtain a diploma or a degree without further residence, so that in any scheme at Oxford if the period of residence for a diploma could be done away with in the case of students at an affiliated college it would be of very great assistance?—Yes; that is a very important point.

5471. Similarly at Cirencester, we hope Cirencester may be affiliated to you if you become a centre?—Yes.

SIR OLIVER LODGE, F.R.S., D.Sc., LL.D., called and examined.

Sir Oliver
Lodge.

5472. (By the Chairman.) You are the Principal of the University of Birmingham?—Yes.

5473. We had some very interesting evidence given us by Mr. Walter Collinge concerning the Department of Economic Biology, so that we have got the details of that, and, perhaps, you will state to the Committee what the intentions are of the University of Birmingham with regard to the development of an agricultural department in the University?—The department, at present, is economic zoology; but we hope it may soon extend. Professor Hillhouse has long advocated an agricultural development; but a consideration of agriculture by the University began, so far as I am concerned, at a dinner at Highbury. Mr. Chamberlain and the authorities of Worcestershire wanted to do something for the University, and I, being then consulted, suggested a veterinary department, animal diseases, and so on. That was looked into, but we found that it was too large a thing, altogether. To do it properly would require an animal hospital, and it seemed beyond anything we could immediately contemplate. Nothing was then done, but Mr. Collinge, being an enthusiast, started on his own account, a thing which has developed into the Department of Economic Zoology. He started travelling about the country and advising the farmers freely, and at his own expense, thereby, of course, gaining a great deal of experience as to those insect pests which are his specialty, and which do an enormous amount of damage in the fruit districts of Worcestershire, Warwickshire, Herefordshire, and so on. Then I drew up this statement: "Statement by the Principal. The advantage of a department for, or school of, Agricultural Research." I only quote a few sentences from it: "The subjects to be dealt with in such a school are first of all the diseases of plants, concerning which farmers are extremely ignorant, secondly, the problem of increasing the fertility of the soil, thirdly, production of useful varieties of cultivated plants. The study of plant diseases is manifestly a supplement to the study of animal diseases in a Veterinary Institution, and it can be conducted on somewhat similar lines, expert advice being available for the use of County Council Authorities for the detection, the treatment, and the avoidance, of such diseases; including among the diseases,

parasites and all foes both animal and vegetable. And by agriculture is to be understood, not simply farming operations of the ordinary kind, but also market gardening, and the culture of fruit trees, forest trees, and all other horticultural operations." Then I have appendices showing how seriously this matter has been dealt with in Canada, in the American States, in Japan, and in Germany. Gradually the matter became more important in our eyes, and at last a Special Committee was appointed by the Council consisting of the Chairman (myself), the Vice-Principal, the Dean of the Faculty of Science, the Dean of the Faculty of Commerce, the professors of botany, pathology, chemistry, and zoology, and another, the professor of metallurgy, because he happened to have been the Director of the County Council of Staffordshire at one time; and they, after many sittings, drafted two schemes, one for a complete school of agriculture, involving degrees and so on. This scheme entailed complete research, teaching and co-operation, with local institutions and advising of farmers and growers, generally, and distribution of information. It was a large scheme which would involve a capital expenditure of £40,000 and a maintenance expenditure of £4,000 a year. At the same time they drafted a smaller scheme for a school of experimental investigation and research. This diminished the teaching to almost nothing, left the research much as it was, and the co-operation and advice much as it was, and involved no degrees and, indeed, not, explicitly, a diploma. That, of course, comes to much less money, but still it comes to a good deal. The first involved an experimental farm of 200 acres; the smaller scheme involves an experimental station of 50 acres, with a total capital cost of £16,500, and a maintenance cost of £2,200. At that time, as at present, the University had no money. These schemes were drawn up largely at the instigation of the Chancellor, who thought that possibly a donor might be forthcoming for a considerable sum, such as £50,000. I do not know what might have happened if Mr. Chamberlain had not, unfortunately, become ill. All that has actually happened, so far, is that we have established Mr. Collinge in the way he has explained to you, into which I will not further enter, on a very small scale, at the expense of the general funds, because we have no

5473a

5473b

Sir Oliver
Lodge.
30 May, 1907

special fund to draw upon. All the funds of the University are already over-taxed, but we realised the importance of taking a step of some kind, and of making a start so that we might have a going concern to show if anyone was willing to provide us with funds to do it more properly. I think it best to proceed now, if we had small funds, on the line of evolution from this and develop that department. At present, it is not on a satisfactory basis. We are not paying Mr. Collinge a proper amount; he is still put to a great deal of personal expense, and I should like, myself, though, of course, I cannot commit the University, to see his energy in the district rewarded by improving his status, giving him a position of a professor, not calling him so, but calling him director of the station, which would be a term which would be better understood by the people with whom he has to do in the county. He would be able, with an assistant and a laboratory boy, and a small laboratory grant, to look after the zoological department. At present, he is technically subordinate to the professor of zoology, he having been demonstrator to that professor for 15 years, and I think he would like now to be independent, and it would be right that he should be. His old place has been filled up. We want, therefore, to give him at least £500 a year, which is the minimum professorial salary; most get £600, or more. In addition to that, we should like very much—in fact, we find it necessary—to have an expert on the botanical side, especially in the matter of fungus diseases, a mycologist of equal standing with Mr. Collinge; but the cheapest way would be not to put him on a level, but to have him subordinate to Mr. Collinge, as a specialist in botany; we could not get him for less than £200. The other expenses that we should have to face would be a couple of assistants; we should have to make a laboratory grant, say, £200 for the two—£100 each. At present, we rent rooms, which come to about £100 a year, including rates, water, gas, and so on, and for travelling expenses, and the issuing of reports—£50 each, we will say—and a clerk has been found necessary, because of the enormous amount of correspondence and questions that come from the different districts—£100. We cover a large area in the Midlands, five or six counties, and the travelling comes expensive, and also the issuing of reports. I estimate that that would amount to about £1,250 a year. If we had more money we could go further and start a man on animal diseases as well—not on a large scale, but just enough to advise the farmers about the diseases of animals. I have drawn up a rough estimate including that and it amounts to £1,750. One of these two I regard as the minimum scheme if we do anything at all; but in order that we may start wisely and not overlap what the counties are doing, we have appointed an Advisory Board of Agriculture with representatives from all the neighbouring counties. This Board is to sit about three times a year, together with the Professors concerned, and they will keep us in touch with what they want, what we ought to be doing and also with what their own schemes are accomplishing, so that there shall be no overlapping, and that we shall be doing what is really wanted. We asked Sir Richard Cooper to be chairman of that Board, but, although he takes very great interest in it, he nominated another chairman, although, practically, he is the chief man on the Board, and I have reason to believe that if we are assisted with funds he will do something to supplement them. I mention these matters because it is money that is the vital question with us. It is not at all difficult to get men who are interested, indeed, we can get men with enthusiasm, but we are constantly hampered by having no money. Of course, the College has some money, but it is more than used for other purposes, and I cannot even ask the Council to make grants for these new departments at present; we have started too much. But we have very much felt the importance of this new departure in the way of agriculture, and nothing but money prevents our carrying it out; the will is quite good. I do not know, my lord, whether I have said the kind of thing that you wanted me to say, but I wished to represent to you the attitude of the University, as far as I could at the present time, and what we should like to do if we saw our way in the future.

5474. Does that scheme to which you have alluded, and which you will hand in the details of to the Committee, represent your views, or have you any observations to add to it. The Committee would like your views as to the organisation of an Agricultural Department at the University?—I cannot pretend to be an expert in the matter.

5475. No, but you have, I daresay, given a considerable amount of thought to the subject?—I myself would rather proceed cautiously and not try to launch out too big a scheme at once. I have felt that a scheme of 200 acres and a capital expenditure of £4,000 a year was shoot-

ing rather too high and before we had got sufficient experience. Certainly before we did anything of that sort we should have to get an expert on the staff and proceed with the help of his advice; indeed, that would be one of the first things we should have to do. We have always, in starting a new department, appointed a professor first and let him begin to organise it. What I myself feel so strongly is not so much the need for degrees in agriculture and a faculty of agriculture, although that may be very important, but the need for more agricultural research. It seems to me that so many things could be done with the soil of this country which are of vital importance; and that the expenditure would be easily repaid by the better quality and quantity of the produce. At present things seem to be carried on, so far as I can make out, in rather an ignorant fashion. Here and there a cultivator of the soil is a man of considerable intelligence, and is able to try experiments and get experience for himself, but such people are rare, and on the whole this very important industry seems to be carried on in a manner which is not calculated to keep the country in the van of progress; and I think that a university, being the centre of a large district, might very well serve as a centre for this research and for distributing information: not only for doing a certain amount of investigation itself, but of course for keeping in touch with what is being done in the rest of the world and seeing that that is known and quickly applied.

5476. I suppose you are of opinion, Sir Oliver, that the Board of Agriculture would be fully justified in spending money on the encouragement of research at the Universities?—I am indeed. I think that that is where this country is so behind at present.

5477. Apart from scientific motives, even from the purest utilitarian motives in the way of assisting agriculture, practically you would expect from the development of agricultural research at the Universities great benefit to accrue to the practical agriculturist?—That is my opinion.

5478. You lay stress on that?—I lay great stress on that; indeed, it is from the practical point of view that we have been looking at it all along, much more than from the scientific point of view. It is such an immediately repaying study. The experiments at Rothamsted no doubt have had some effect already with regard to manures and things, but there is a great deal to be done; the subject is a very large one indeed.

5479. It is a field that has been very much neglected?—I should say so.

5480. Especially as compared with what is done in the United States and in Canada and in Germany?—Yes.

5481. We are not up-to-date?—We are not by any means up-to-date with what is being done in Canada and the States, and, I believe, also in Japan, but certainly in Canada and the States it is very clear that they are much in advance of us, and have regular machinery for distributing information in the way of bulletins, which are no doubt known to you.

5482. You attach great importance to disseminating information?—Yes, but I find that documents are not sufficient for the farmers; they will not read them. Documents are distributed by this Board, but it is very difficult to get the farmers to read them, and to get them into their minds, unless it is done personally. We have carried that principle out, and have got into communication with them and consulted them and advised them without charging any fee. If we were to charge a fee they would think we were trying to get something out of them; but, as it is, several farmers who at first would not allow us on their land at all are now quite willing to give us every facility. We find in the whole of our county and in the adjoining counties the same thing, many are now perfectly willing.

5483. You have been very fortunate in the appointment of Mr. Collinge, who has obviously secured the confidence of the farmers in your neighbourhood?—Yes, I think he has been quite successful in doing that; and it is easy to judge of that by the calibre of the men who have come largely at his request on to the Board to advise us. Mr. Collinge is an enthusiast in the matter, and it was because there was the man already there that we made the appointment. I think that is rather the best way of making appointments sometimes, when there is a man on the spot, instead of looking out for a man to give him a specific berth: at any rate that is what we have done in his case.

5484. (By Mr. Acland.) Have these two schemes which you have referred to been framed with a view to

Sir Oliver
Lodge.
30 May, 1907

a probable existing benefactor, or just in case a benefactor might happen to come along?—I will answer your question, but I should like no note to be taken of what I say. (*The Witness made a statement.*)

5485. Did I understand you rightly to say that you would not be likely to get contributions from local authorities towards any department you might set up?—The county authorities are quite friendly with us, and I have not abandoned hope; I have rather some hope of getting, for instance, out of Staffordshire £200 a year more, but they say that their funds are already occupied, and well occupied, and that to give us that they would have to take it from somewhere else, and I hardly like to press them at the present time.

5486. You know in other parts of the country, for instance, in the three Ridings of Yorkshire, they contribute a large sum to the University of Leeds for agriculture. You think it would be difficult to get that in the Midlands?—Yes, I think so. Stafford gives us £500 a year, and Worcester gives us £500 a year, but not earmarked; it is for general purposes, and we are trying to get Warwickshire to do the same, but it has not done so yet.

5487. Do you think, if they consented to ear-mark a portion of the money to agricultural purposes, that it would assist you?—Possibly. We certainly have a claim on Warwickshire, because we are taking a number of students from their district, but at the same time they regard themselves as poor.

5488. Would you say pretty strongly that there is a considerable strain already on any resources which the counties have for secondary education?—Yes, and I do not think we could get more than £200 extra out of them. Besides the Department of Economic Zoology and Botany which I have mentioned, the scheme provides for a Department of Agricultural Chemistry and Agricultural Bacteriology. The chemistry I do not press, because I think the biology side is more important. I suppose I may say the biological side of agriculture in many ways has become very much more prominent since the discoveries of Pasteur. Whereas everything used to be treated as chemistry, everything now has a biological side; it is in that direction that advance is possible, and it is in that way that I want it to specially develop, so if we had two or three men they would all be of a biological character. That is the direction I want to proceed in. That is the side that has been less worked on than the chemical side in the past.

5489. (*By Mr. Latham.*) Mr. Acland asked you a question as to whether, if money were ear-marked, would not it assist you? Do not you think the ear-marking of money, so far as agriculture is concerned, is almost a matter of impossibility?—It is very much a matter of accounts, is it not? Of course we have ear-marked money for scholarships.

5490. That is rather a different thing?—For administration purposes it is rather a matter of accounts. They might, however, increase an existing grant because we were doing agricultural work.

5491. That would not be quite ear-marking it?—Not quite.

5492. You told us you do advise the farmers, but you did not say how far that work was carried?—I think Mr. Collinge gave you that information yesterday. The farmers write to him when they have something they require advice about, blight—or whatever it may be—and ask him to come down and advise them, and he goes down and advises them what to do if he is able to deal with it on the spot, but sometimes it is very puzzling, and he has to bring it back and study it in the laboratory. He is so busy doing that kind of work that we are going to provide him with an assistant.

5493. What would be about the cost of students coming to this agricultural department provided it was established?—You see we have not gone in for the educational side much. This minimum scheme that I am now speaking of contains no provision for ordinary students. We thought that we might get some senior students sometimes, as from the Harper Adams College or from the one at Kingston, Derby, or some other trained men coming to us to get experience rather in the nature of research—an assistant in fact, rather than a student. The students are studying their ordinary subjects under the ordinary staff of professors, but they would not come into this department except as assistants. The investigations that go on in the laboratory are above the ordinary agriculturist, but it is

boiled down and put into such a form by the men who go about among the farmers that they can appreciate it.

5494. That is in the way of lectures and demonstrations. —We would not expect the agriculturist to come to many lectures. Very few lectures are given. Mr. Collinge has lectured once or twice to gardeners, or to some special class of men, but it is not easy to do it by lecturing, partly because the farmers are distributed all about. I am not quite sure of the class of students you mean—whether you mean those already engaged in agriculture, or those preparing for an agricultural profession.

5495. What I am interested in myself is the ordinary agricultural farmer's son. Ever since I have been sitting here I have listened with some interest to try and see where I can see the ordinary farmer's son is to benefit by this investigation, and I want to know whether you think your scheme would be of any value to them, or whether it would not be above, I will put it, the ordinary farmer's son?—Yes, I think it would. It was debated whether we should try and fit ourselves up as an agricultural college, and it was thought we had better not do that because we should be competing to some extent with the agricultural colleges which already exist.

5496. Are they very thick round you?—No; there is the Cirencester and the one at Kingston, Derby, and the Harper-Adams College in Shropshire.

5497. They are not very near you?—No, not very near.

5498. And the ordinary farmer's son could not afford to go that distance?—I confess I should hardly have thought they would want to go to a place like Birmingham for agriculture.

5499. I agree, and possibly it might give them a great dislike for it if they did, but where are they to go? Are not these the very men that need it?—My idea is that the majority of boys going into farming would not want such a complete course as the University would give; they would want something less; and we had better reserve ourselves, at any rate until our funds are more advanced than they are, for the cream of the fellows who are going into the higher walks, so to speak.

5500. I must ask you what class of man that is?—Lond agents, or men of that kind. I expect you know a great deal better than I do the class of man I mean.

5501. No, I will not say that. I am an agriculturist myself, and I want to do my brethren the greatest possible good I can by sitting here, and I want to know how they can be improved by the education that this institution can offer, and I am so afraid that the expense will shut them out from that?—I do not see how we could provide for a large number of students except by what we call here the larger scheme.

5502. I think nothing of your little scheme; it is the larger scheme that I refer to?—The larger scheme would provide for a considerable number of students, and the fees would not be very heavy because the fees never pay for the expenditure.

5503. You have spoken of the great benefits that foreign institutions receive from some scheme of agricultural education. How is the money provided in these countries? I think by the government department of agriculture in those countries.

5504. It would be no serious matter to ask our Government to supplement the grants for the benefit of agriculture in the same way would it?—I should think certainly the Board of Agriculture should have much more money than it has now, if it is to do a proper amount of good.

5505. I quite agree.—But when one enters into educational matters there seems a chance of overlapping the Board of Education, but I do not know how that is. A University is not subject to that Board. You were asking what would be the advantage to agriculturists. Quite irrespective of teaching the young fellows, there would be a considerable advantage if the methods were improved and they were shown how to tackle the diseases and how to deal with the other problems which occur in their ordinary work. If the mass were taught in the field empirically without necessarily a great scientific basis being laid for them all, it would be of value; because I do not think it is likely that they would all be competent to take a scientific course where it would be necessary to go into the thing properly. They could receive information from those who have so studied the theory and be able to apply it.

5506. Is it your opinion that the education in agriculture

Sir Oliver
Lodge.

30 May, 1907

would be very much better carried out through the Board of Agriculture than through the Board of Education?—I should not like to answer that without thinking more about it. I do not think that I could answer it.

5507. In all probability, is it not so abroad—that it is done through the agricultural committees?—I do not know whether the Government departments of agriculture subsidise the Universities very much in America. There is a regular large department of agriculture for disseminating information and for carrying on work, but I am not sure that they take it up on the educational basis exactly.

5508. I take it that your great object in asking for these schemes is because such schemes cannot go to the less important bodies; it must go to the University?—Yes; if the big scheme is to be done at all it must be done by a University.

5509. (*By Dr. Somerville.*) I think the Committee may conclude that your greatest hope for the future, as regards development in Birmingham, is the direction of agricultural research?—Yes, the immediate development, in a very large sense, of agricultural research.

5510. And also in the direction of advising cultivators?—Yes.

5511. Personal association between the members of such an agricultural staff as you may set up, and the men who are concerned with the practical problems of the soils and of the stock?—That is so.

5512. It has been argued that there is no reason why, if the Government should provide the *personnel* necessary to advise farmers in their calling, they should not also provide similar advisers to assist other British subjects who are engaged in such industries as chemical manufacturing, iron and steel working, coal working, dyeing, and the like. I am not quite sure that I have heard a perfectly satisfactory answer to such a line of argument; can you tell the Committee why you think the Government should provide State aid for the supply of advice to those engaged in the agricultural industry, and should not supply similar advice to those engaged in other British industries?—Yes. That is a very interesting question. It seems to me that the land and the increase which we get out of the fertility of the soil by the help of the rays of the sun put agriculture on a different basis from all other industries. The human race is totally dependent on solar radiation, on the energy it gets from the sun, and the only way of getting that energy is by the surface of the earth. There is no other real increase, that I know of, in the same sense, that can be got in any other way; and whereas many manufacturing industries are carried on for private profit and result in luxuries and conveniences of various kinds, the agricultural industry results in the food of the people and is a necessity for all. It is of greater importance, of more primary importance, than any other industry; and of enormous importance, I suppose, during times of war. It seems to me that so little study has been applied to the problems connected with the fertility of the soil that we hardly know what could be done towards the making our country self-sustaining in this matter and able to grow its own food. We have never really made a serious attempt in that direction. If such a result is desirable, it can only be carried out after scientific discoveries and with the help of the application of them; and the matter seems to be so important to every person in the community that it is properly a national undertaking, and, properly, should come from the national purse. That is the line of answer I should try to give.

5513. So that you think there is something inherent in the province of agriculture that warrants State aid, and that does not apply in the case of ordinary commercial or mercantile enterprises?—I do.

5514. You think, therefore, there is nothing inconsistent in State aid being given for the development of agriculture beyond what is given towards the development of many other industries?—Yes, which are of a more local and less universal character.

5515. (*By Mr. Medd.*) With regard to agricultural research, do you think that its development at such a centre as you contemplate would be promoted by a consultative or advisory committee being appointed and meeting periodically in London, and upon which your University would, of course, be represented?—To unify the efforts in different districts?

5516. Yes, to put one area into touch with another area?—I should think that it would be better to keep up a kind of local self-government in this matter, and not try to over-centralise. I think it is found generally, with a body of sufficient magnitude and dealing with a sufficient area—it should not be a hole-and-corner piece of work—that

such a body is better with full autonomy and full responsibility for what it is doing; and I should be sorry to see a central committee, with all the different universities and districts represented upon it, and trying to make a single unified scheme. I think it would be better for each university to work out its own scheme. Some would be more successful than others, and those which were more successful would be imitated. By that means a great number of experiments can be tried at the same time, and we should not be put into shackles and leading strings too much, but would take the benefit of local circumstances and develop on our own lines.

5517. I may say that it is not suggested that the consultative or advisory committee should exercise any control over the local institutions, but should act rather as a channel through which the local institutions could communicate with the Board and bring pressure to bear on the Government, and keep itself in close communication and touch with other local institutions. That would be the limit of its operations, in so far as the local institution itself would be concerned. What is the exact constitution of your present Committee or Board of Agriculture. You have a Committee or Council, have you not?—Yes, just recently started. It consists of a delegate from each of the neighbouring counties.

5518. Which are they—I think Mr. Collinge told us yesterday, Derby, Stafford, Worcester, Warwick, Leicester, and Shropshire?—Yes—and Herefordshire.

5519. What are its functions?—That is not the whole of the Committee; those are the outside members of it. There are also the Professors of Zoology, Botany, Bacteriology, Chemistry, and Brewing, also the Dean of the Faculty of Science, the Principal, and the Vice-Principal. At present it is purely advisory—in any case it will be that. It will report to the Faculty of Science any recommendations made. That will go before the Senate, and finally to the Council, who is the supreme power and can pass it into operation, and who holds the purse-strings.

5520. Have you approached any of these Councils with a view to their becoming definitely affiliated to you for the purposes of agricultural education?—No. There is some talk of co-operating with places like the Harper-Adams College.

5521. I was thinking rather, of such counties as Worcestershire becoming affiliated to you as a collegiate centre for agricultural education and making a financial contribution to you. Perhaps you have not got to that stage yet?—No, we have not got to that stage yet.

5522. Do you propose to give a degree or a diploma in agriculture?—If we can carry out one of these larger schemes, but not with the minimum scheme.

5121. With the larger one?—With the larger one, certainly.

5124. That would be the ultimate object?—Yes.

5125. How far do you insist on residence in the case of degrees?—We always insist on a three years' attendance.

5126. You do not grant a degree in any subject without residence?—No; they must first matriculate and then they must pass three years—in some subjects it is four.

5127. Have you any institutions of education affiliated to you now not in agriculture?—No, we have not. There has been some talk of affiliating a training college for teachers at Handsworth, but it fell through. What we should have done there would have been to accept their instruction up to an intermediate stage, but we should still have insisted on their coming to us for the final two years.

5528. That would mean a year less at least?—It would mean our letting them off one year: when sufficiently prepared they could do our work in two years.

5529. You do not contemplate abandoning any part of the residence?—No, we must stick to that by our charter; that is a vital thing. We are a Teaching University. There is the external University of London, of course.

5530. Yes, I had that in mind. You referred incidentally to the danger of overlapping with the work of the Board of Education in these agricultural institutions and so forth. Are you at all familiar with the organisation of agricultural education on the continent?—No, I am not.

5531. Do you not think that all overlapping may be avoided if the work of instruction so far as it is of a technical character bearing directly upon the industry of agriculture is under the Board of Agriculture, and general education so far as it bears upon the training of teachers in elementary schools and so forth remains under the Board of Education, the sphere of the one being educational

*Sir Oliver
Lodge.*
30 May, 1907

and the sphere of the other being technical as applied to a particular industry?—I quite feel there might be discrimination of that kind. We have several Boards in the University, each of which practically governs a particular department.

5532. That is the rule in Holland and France and Ireland and you believe it is quite possible to work it so in England?—To discriminate between general education and technical education for the final years especially. In the early years all would come rather under the general education.

5533. Yes. I might put it in this way, that all that is given in the elementary schools, the secondary schools and the colleges comes under the Board of Education, but what is given in a technical school in the way of agricultural education, that is the education of the farmer, comes under the Board of Agriculture?—Yes.

5534. The central department at the Board of Agriculture at Washington is not responsible for the States?—I believe that is so.

5535. The agricultural education is organised under the Murrell and Hatch Acts by each State itself?—Yes. We are not under the Board of Education at all as a university, except in the matter of the training of teachers. The Board of Education has to do with us in the training

of primary teachers, and I suppose secondary teachers too, but in no other way.

5536. Does the Technological Branch come into contact with you at all?—No, it comes into contact with the City Technical School.

5537. That is not incorporated with the University?—No, it does not touch us at all: we are quite independent of the Board of Education in our Technical and Scientific Education.

5538. You have a School of Engineering?—Yes, a very large one.

5539. And a School of Brewing?—Yes.

5540. Have you any Government aid for that?—No, we do not get any Government aid for the engineering or the mining or the metallurgy, or anything except the general grant we get as a University College; and another grant for University purposes. That is all; there is no specific aid for special subjects.

5541. I may take it you are of opinion that it would be better to retain the work of education in so far as it is technically directed to agriculture in the hands of the Board of Agriculture?—I doubt if I see the full bearings of the question; and a sudden judgment would be of no use.

TWELFTH DAY.

Tuesday, 4th June, 1907.

PRESENT

The Right Hon. Lord REAY, G.C.S.I., G.C.I.E. (*Chairman*).

The Lord BARNARD.

Lord MORETON.

Mr. DAVID DAVIES, M.P.

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Professor T. H. MIDDLETON, M.A., M.Sc.

Professor WILLIAM SOMERVILLE, D.Sc.

Mr. A. E. BROOKE-HUNT (*Secretary*).

Mr. H. L. FRENCH (*Assistant Secretary*).

Colonel S. T. H. BURNE, called and examined.

*Col. S. T. H.
Burne.*

4 June, 1907.

5542. (*By the Chairman.*) You are the Chairman of the Board of Governors of the Harper-Adams Agricultural College, Newport?—Yes.

5543. And you are also Chairman of the Finance Committee?—Yes.

5544. Then perhaps you will explain to the Committee the will of Mr. Harper-Adams and the scheme which was approved by the Charity Commissioners?—The testator devised all his property "and the investments thereof upon trust that the trustees should apply the income arising therefrom, or the capital thereof, in such manner in all respects as they should in their absolute uncontrolled discretion think proper for the purpose of teaching practical and theoretical agriculture to men and youths and a knowledge of dairying, housekeeping, and other subjects, to women and girls, which will tend to make them practical and useful women in their station of life in England, either by means of lectures or by establishing a school or schools of agriculture at Edgmond or Woodseaves, near Market Drayton, in the County of Salop, or at Chadwell, in the County of Stafford, or elsewhere in England, or by such other means as they or he should in their or his absolute discretion think most likely to give effect to the purpose aforesaid, it being his intention that they or he should not in any manner be restricted in such means by anything therein named, but so, nevertheless, that no part of the said income or capital should be applied in any manner which should in any wise be invalid under the present or any future statutes against mortmain, and the testator

declared that the trustees or trustee might invest in trust moneys in the purchase of hereditaments in England or Wales which should be required for actual occupation for the charitable purposes thereinbefore declared." The fullest possible powers, I think, are given that could be given to the trustees to use the money for agricultural education.

5545. What year was that?—The will was dated October 28th, 1891, and the testator died on the 7th June in the following year, 1892.

5546. What was the sum left?—The net amount that the trustees handed over to the Governors under the scheme was £45,496; that included £6,740 accumulated income.

5547. And how much of that was spent in the erection of buildings?—The actual cost of the buildings was £22,260. Then, of course, there was about another thousand pounds on other preliminary expenses which brought up the capital charges to about £23,000 altogether.

5548. Was the remainder invested?—£31,800 was invested, but of that a certain portion, £5,000, had to be sold out to meet the expenses, because we had not sufficient in cash to provide this £23,000, and we had to take £5,000 out of the previously invested money which would reduce the invested money to the nominal value of £26,000; and that, I believe, is about the amount. I cannot say what the value of it is at the present time. On the purchase price it should be £26,000.

5549. Then the County Councils of Shropshire and

Staffordshire support this?—Shropshire has been very liberal in its support up to this year. They gave us a grant of £2,500 at starting for equipment, and for six years they have provided £800 a year.

5550. And Staffordshire?—Staffordshire gave us a thousand towards the building grant, and then they voted £350. But there are very many stoppages for various exhibitions and scholarships and such like things, that the amount we actually received was a fluctuating amount. It was always £50, but it got up to £100. They have lately reduced the amount of scholarship deduction, and the last two years it has averaged £200.

5551. And these scholarships are held by the Staffordshire boys?—Yes, at the college.

5552. And you have a farm?—We have a farm at the college. There are 180 acres, the property of the college, and there are 50 acres of hired land.

5553. And the buildings are the property of the college?—Yes.

5554. And are students resident at the College?—Yes, we have over 30 at the present time; we have accommodation for 50; it was built with the idea of accommodating 50.

5555. You say that when the institution was founded, you had no other institution which could be a guide to your Trustees and the Charity Commissioners also were unable to help?—We called on the Charity Commissioners to ask them for assistance. They responded by telling us that they looked to us as the experts in the matter, and hoped we should give them assistance. Before the scheme was carried out we had an inspection made of Holmes Chapel, Uckfield and Dauntsey, West Lavington. Holmes Chapel was founded, I think, in 1895, two years after the will was proved, Uckfield in 1894, one year after the will was proved. I do not know when West Lavington was founded, but it was not quite the same sort of school. So that, at the time the will was proved, I do not know of any similar institution in England.

5556. And the farmers at that time were they rather opposed to the foundation?—They were scoffers. And, I think, the same happened in other parts, too, because in the report of Uckfield, there they complained that the farmers, and not only the farmers, but a good many of the Governors, were scoffers as to the good it would do.

5557. But their view has quite changed?—Quite changed round, about our college.

5558. Is the farm visited by farmers?—Yes, by a great many.

5559. Do you conduct any experiments?—In conjunction with the County Council we have carried on external experiments in Staffordshire and Shropshire; but the last two years the Shropshire experiments have been carried on entirely at the expense of the college. Up till then—I mean this year and last year they had been carried on at the entire expense of the college; previous to that the out-of-pocket expenses were borne by Shropshire. The out-of-pocket expenses are still borne by Staffordshire. We work as a joint board in the matter, and the report is issued concurrently.

5560. Are any lectures given in the counties?—Yes, the County Councils really are the lecturing body, but some of the lectures are provided by members of our staff.

5561. Are they well attended?—Extremely well attended and the attendance is increasing, and the demand for the lectures from various centres is also increasing.

5562. And that is a cause of recoupment of students for the schools?—We hope so. It brings us into touch with the counties generally.

5563. Then the fees charged and the number of students—can you give us any information on these points?—The fees charged for the scholastic part are £8 a year, and for the boarding part £35 a year. I may say that the fees have been put extremely low because, from what I have read of the will, I think you will gather it was intended to meet the requirements of people of limited means, and in drawing up the scheme we kept that in view, and kept the fees low in the hopes of attracting people of the class the testator desired.

5564. And those with scholarships paid no fees?—Well, of course the scholarship money does not pass through our hands. We receive for the scholars who have gained scholarships exactly the same amount as for the others. We don't pay that: the County Council pay it direct.

5565. And the salaries of your staff, Colonel Burne?—The salaries of the staff are low, I think. I am not perhaps

able to give the exact sums—Mr. Foulkes can give that; but they are too low for us either to get the best men or to retain the services of young men when we get them. I might mention in this connection that when we first started we engaged a dairyman at £65 a year, but he had not been with us very long before he got an appointment under the Irish Agricultural Department at £200 a year. We appointed a successor at the same salary, £65, and we increased him gradually up to £80 a year. He left us after about three years' service to go to Cirencester, where he received £100 a year, all found. Our next man we had to take on at the price we finished with the last, £80 a year. He only stayed with us three months, and he took a more lucrative post at Aspatria. Our present man we have engaged at £90 a year. That would prove that we are not paying sufficient salaries to keep a dairyman, at any rate.

5566. And does that apply to other members of the staff?—Yes, I think so.

5567. Can you tell us what the staff is?—There is the Principal, there is a mathematical and land surveying man, there is a chemist, there is the practical man, the farm steward and his assistant, there is the botanist, and there is the veterinary lecturer; there is also a lecturer in bee-keeping and gardening.

5568. Is there any instruction given in book-keeping?—Yes, the mathematical man gives instruction in book-keeping.

5569. And you want more money?—We want more money. The work has not been curtailed as to what we have undertaken. I think we have carried out fully all the work we have undertaken, but we are in difficulties and if we had more funds we could do more.

5570. You could give more adequate salaries to your staff?—We could get better men on our staff, and I think our chemistry department wants strengthening. We are refusing work in the laboratories which might be of great service, both scholastically and to the outside public. We are absolutely refusing work.

5571. I suppose the farmers consult you?—They are very fond of consulting us, but Mr. Foulkes can give you the particulars with regard to that better than I can. They are very fond of consulting us privately for advice without going to the trouble and notoriety of calling into operation the Act of Parliament, and I should think on the whole it is a very good thing they can do so.

5572. They would rather come to you than go to the analyst?—A good many of them, and they would do so more if they had the chance. We don't pretend to take any cases that are going into court to be tried. We give private information, but if they want to go into court they must take the Act of Parliament and put that into force.

5573. (By Lord Barnard.) Could you give us any more information as to the origin of the college? Can you tell us who Mr. Harper-Adams was?—Well, I suppose you would call him a yeoman landowner. He owned three properties—one at Edgmond, one at Woodseaves, near Market Drayton, and the other he got from his brother, at Chadwell, in Staffordshire.

5574. Can you tell us at all what led him to make this magnificent foundation?—No, I don't think I can. I have heard that he said that he got all his money out of the land, and he thought the best he could do was to leave it back to the land.

5575. Are you aware whether he took any interest in scientific agricultural education? Was he a good farmer himself?—Anything but; at one time, however, he greatly improved the present College farm by the use of bone manure.

5576. That's very odd?—It is most extraordinary, and the land he farmed was in a very queer state latterly.

5577. The will was dated in 1891, and the testator died in 1892. What did the trustees do in 1892? Did they go to the Charity Commissioners and apply for a scheme?—We did not apply for a scheme as a matter of fact until the Charity Commissioners had put before us a scheme we could accept. We had a free hand, and we thought we had better keep it until we were satisfied the Charity Commissioners would do something we approved of.

5578. I don't quite understand how the Charity Commissioners came in?—Well, eventually we did apply for a scheme. We started, first of all, to realise the estate, and we had a lawsuit over it. A niece put in a caveat

Col. S. T. H.
Burne.
4 June, 1907.

Col. S. T. H.
Burne.
4 June, 1907.

against the will, and we settled that by paying her £12,000, I think it was. Of course that was done through the Probate Court.

5579. You were one of the original trustees?—Yes, I was one of the original executors and trustees.

5580. You have told us that you still have an invested capital of the nominal value of £26,000 or thereabouts; can you tell us what is the income which you now derive from that endowment?—About £800 a year.

5581. Then really the foundation has provided land, buildings and an income of £800 a year?—That is what it stands at now. The farm previous to being taken over was let at £319 gross rent a year.

5582. You have only recently started the college. When was it opened?—In 1901.

5583. Then I suppose I might say, in your opinion the institution is even now more or less in an experimental stage?—Certainly.

5584. I mean it is still developing?—Yes.

5585. The County Councils of Shropshire and Staffordshire have only recently had the whole question under their consideration, and the subject is not yet settled?—The Salop County Council have approached the Staffordshire County Council, and they have got the Staffordshire County Council to somewhat increase their grant, and they at the same time have cut their own down from £800 to £350, and the only good point that I can see about it is I understand that there is a joint advisory committee going to be appointed between the two counties—it may be good or bad, it depends what they do.

5586. The matter cannot be regarded as completely settled?—I don't think so.

5587. Are you a member of the County Council?—No.

5588. Are you in any way under the jurisdiction or control or guidance of the County Council?—Not in the slightest.

5589. Do they have any representatives on the governing body?—Yes, each county has two representatives. They have them under the scheme, and further, when they made grants to it we accepted additional representatives under some Act of Parliament.

5590. That is the Technical Instruction Act?—Yes.

5591. Then I see the University has a representative, and the Royal Agricultural Society?—Yes.

5592. And the Petty Sessional Justices of Newport?—Yes.

5593. Does your body regard the work as satisfactory?—Yes.

5594. You are satisfied with the constitution?—Oh, yes.

5595. And you have power to select other members?—Yes.

5596. Do you make any report to the County Council? I suppose their own members report?—No, we are not bound to make any report. I suppose their own members report.

5597. Do you issue a balance-sheet every year?—Yes, and statements of accounts. It is laid down under the scheme. It is, practically, the stereotyped scheme of the Charity Commissioners; Clause 19, I think it is.

5598. You have to return those accounts to the Board of Agriculture?—Certainly; if we don't have to, we do it.

5599. Do you think that there would be any objection to your being placed under the guidance. I'll call it, of the County Council, that is to say, if the County Council should be induced to provide for and control this sort of instruction?—You see, this property was left to establish a school or schools of agriculture in Salop or elsewhere in England; the money was not only given for Shropshire and Staffordshire. You must always remember that.

5600. But assuming that the subject of higher agricultural instruction generally was to be more organised, would you have any objection to the County Councils—I put it generally—all over the country being entrusted with duties and having greater power in connection with the subject?—No, certainly not, speaking broadly. So far as this Institution is concerned I should be quite prepared to consider any well-considered scheme for handing over the College, practically, to a Committee, provided that the County Council's Committee would guarantee the balance of the cost at the finish, and sufficient precautions were taken on that Committee to watch the interest of the original trust.

5601. What I gathered from the information you gave

the Chairman is that the County Councils are carrying on a certain amount of work side by side with the College?—Yes, especially Staffordshire.

5602. And would you agree with me that it might be desirable that it should all be centred in one Institution under the guidance of the County Council so that there should be no overlapping?—Yes. I don't think there is any overlapping, as a matter of fact, because we have worked in harmony with the County Council.

5603. Then with regard to a central control—you receive a grant from the Board of Agriculture?—Yes.

5604. But beyond sending a report every year, they don't interfere with you although they are willing to give you assistance and guidance?—They send down their inspector, and we have the benefit of his advice.

5605. And you consider that satisfactory. Do you welcome his visits?—Oh, certainly.

5606. And obtain advantage?—When we were in difficulties Mr. Brooke-Hunt was very useful to us, indeed.

5607. (*By the Chairman.*) Are there any farmers on the Governing Body?—Yes, the Magistrates, at the last meeting, appointed a tenant farmer, pure and simple, and there are several others. One of the County Councillors is a tenant farmer, pure and simple; and those that are not tenant farmers, pure and simple, are almost all landowners farming themselves.

5608. (*By Mr. Latham.*) Prior to this will, what were the County Councils of Staffordshire and Shropshire doing with regard to education? How were they spending their "whisky money"?—There were some lectures. But, off-hand, I should say they were doing very little, from 1902. I forget what date the "whisky money" was granted.

5609. Then until this College came into existence there was little done?—Very little. I forget the date on which the "whisky money" was voted, but, I do not think, it was when the will was proved; I do not think it was in existence then.

5610. Did you take up their scheme?—We did not take up their scheme, and Shropshire considered this a perfect "godsend" to their county. When they were in difficulty as to how to deal with agricultural education, this dropped down in their midst, and they greeted it as an excellent means of spending their "whisky money" on agriculture.

5611. They were spending much more money before you began?—I do not think they were spending more before we began; I think they were spending less. They had spent very little money on agricultural education until this came into existence, then they began to spend by giving us £800 a year. But now they are decreasing it to £350.

5612. Have they given you any reason why they have decreased it?—They have not, except that they have brought Staffordshire into line with them, which means that they have come into line with Staffordshire.

5613. Then the two counties are considerable gainers by this will?—I should say so. Oh, most decidedly, the benefits are very great.

5614. You made the remark that you visited two or three educational centres, and West Lavington was not up to what you do?—West Lavington was a school—I didn't go there myself—it was a school for young boys.

5615. You didn't find fault with it?—Oh, no. It was more elementary than what we proposed—that was what I meant.

5616. You spoke of the farmers being against you and inclined to ridicule you, was it at lectures, or at the idea of the College, or what was their idea?—Well, they doubted whether the scientific people could teach the practical people. They thought the scientific man was no good on the farm, and that what they wanted was a practical man; and to a great extent, I agree with them.

5617. I agree with them very much indeed. At the same time, do you think the combination of the two is beneficial to agriculture?—That they did not grasp, but I think they have grasped it now.

5618. Do you find the larger farmers or the smaller take advantage of the College?—The larger, on the whole.

5619. Now what advantage do you offer to the smaller man? Perhaps I had better ask my next question before you answer. There are certain fees, I take it, which you charge the larger man with residence; do you take any of the smaller men without residence at smaller fees?—The fee without residence is £8 a year.

5620. And for how many weeks is that?—For three terms of twelve weeks—36 weeks.

5621. And what is the fee for the larger man?—Oh, it is the same, the boarding fee is £35 a year if they live in the College, plus the £8, that is £43 a year.

5622. What does the shorter course include?—The shorter course is an eight weeks' course for farmers' sons, but Mr. Foulkes can tell you better about that.

5623. Have you any outside visitors to the College?—In the summer we have a large number. I have several times been there to meet visitors, and we have had 80 to 100 at a time.

5624. What class of man is that?—Chiefly farmers from all parts of the counties.

5625. Do they come to see experimental work?—They come chiefly to see experimental work; they take the greatest interest in that.

5626. What lectures do you give to the outside public?—We give lectures on behalf of the County Council in horticulture through the botanist, and in veterinary science.

5627. Are your veterinary lectures well attended?—Very well attended.

5628. I see the veterinary lectures are given by a member of the College; is there any feeling against that sort of thing? Do the veterinary people feel you are going too far?—I have not heard of anything; it has not reached me if there is any such feeling. In engaging a veterinary surgeon we tied him down not to practise. He was not to practise privately, so as not to compete with the local veterinary surgeon in that way. He was to devote himself exclusively to lectures. I never heard that the local veterinary surgeons objected to the lectures.

5629. I take it he was a man from outside?—Yes; when we first started we employed a local man, but we found a local man was called off occasionally. He could not give the time; he had to work at his own profession and could not always attend.

5630. Do you go in for horse-shoeing?—We have a blacksmith one day a week, and the residents all have to go through a course of shoeing. I do not know whether they become very proficient or not, but still they could take a shoe off or put one on at a pinch.

5631. Have you given agricultural lectures at the different centres on market days?—No: we have only given lectures at the College open to the public.

5632. But you have not been to the several centres and given lectures to the farmers on market days?—No.

5633. You have no invitation from the farmers to go outside?—No, not in the sense of lectures. We have had invitations from the show societies to put up a tent and give demonstrations in various subjects.

5634. If these farmers' clubs, which I know there are in Staffordshire and Shropshire, were to make application to you to give them lectures at the ordinary market, would you feel disposed to do it?—I should think undoubtedly we could undertake them.

5635. Don't you think that would rather endear you to the farmers?—At present Stafford have their own agricultural lecturer, therefore any agricultural lecture in Staffordshire would be from him.

5636. He does not come from you?—He does not come from us. He comes from the County Council to us; he lectures at the College.

5637. Is he certified by you as an efficient lecturer, or is he picked up by you?—I think he is very good, and he has the ear of the farmers all round. He brings them to the College.

5638. What dairy work have you done?—We keep a dairy and teach all sorts of butter and cheese making.

5639. I think you said you had a little trouble over your instructor wanting too much money—have you tried a lady?—We had one temporarily.

5640. Wouldn't she come for a great deal less money?—I think not. But we thought there were certain objections to having a lady instructor there always.

5641. Did the County Council offer scholarships available at your College?—Yes.

5642. At what value?—I think the highest Staffordshire scholarships are £45 or £50.

5643. And Shropshire?—I think £35.

5644. What length of term does that give?—Two years, with occasional extensions to three.

5645. Can you tell us what your two years' course is?—I think Mr. Foulkes will do that better than I can. *Col. S. T. H. Burne.*

5646. I see you give mechanical teaching—how far does that go?—It does not go very far. What we want to teach them is to be able to put a self-binder together.

5647. I quite agree with that. It is more showing them how to take implements to pieces and put them together than it is actual mechanical work?—Yes, we have a mechanic, a fitter and a lathe, and the student gets a smattering of that sort.

5648. Then you really do keep a tradesman's shop?—Yes.

5649. Do you go in for research work at all?—Not very much. We consider education is our line, not research.

5650. What are the principal experiments that you go in for?—The principal experiments are seed-growing and manurial experiments—experiments on varieties of seeds and experiments with manures.

5651. You say a great change has come over the general practice of the farmers in the district?—The educational work is appreciated.

5652. What proportion have you of farmers' sons in comparison with other tradesmen's sons?—Mr. Foulkes has the actual figures. I have not the figures, but I believe more than half the attendance is by actual farmers' sons.

5653. Can you tell us at all whether the education that you give to these farmers' sons is appreciated and that they return to the land, or that it lifts them out of their sphere and they go into other occupations?—According to the Principal's returns, so far as he knows, 142 out of 183 have gone on to some sort of work on the land, either agency or farming at home or abroad—a very large proportion.

5654. I was just going to ask that question with regard to valuers and land agents—do they take advantage of your College?—The returns show that 14 have become land agents and teachers.

5655. Do any of them go abroad and take advantage of foreign agriculture?—Twenty-nine appear to have gone abroad.

5656. (By Mr. Medd.) What is the exact income from the endowment?—Last year it was £836.

5657. Then you hand the whole of the income over for the benefit of the College?—Yes.

5658. What is the exact character of your own property? You own the buildings?—Yes, all the land north of the road is our own property, and south of the road is hired land. (Referring to plan of farm.)

5659. I suppose it is not mortgaged in any way?—No; freehold.

5660. And no heavy outstanding liabilities?—None whatever.

5661. And I understood you to say to Lord Barnard that you would have no objection to co-operating, generally, with the County Council of Shropshire—possibly the County Council of Shropshire would become responsible for the whole of the agricultural education?—I said I should have no objection to considering a scheme. I should have certain objections to handing it over offhand.

5662. Exactly. You wouldn't transfer the trust in any way to them or the management of the trust?—I should say not.

5663. I may explain what I mean. There are in all counties large gaps between the elementary schools and Institutions like yours, and such an Institution as yours, in co-operation with the local authority, might fill those gaps much more efficiently than if you worked independently of each other?—I do not think the majority of the students at the Agricultural College come from the elementary schools, so that I do not think we should be filling that gap.

5664. No, you would not; but then you would be the collegiate centre to which the best and most select of the pupils would come?—We can be that now.

5665. But there are intervening grades, unfortunately?—I don't quite follow. But I hope the idea is not to reduce us down.

5666. No, it is to make you the head to which all aim. At present, in Shropshire and elsewhere, you have nothing in the nature of intermediate agricultural education?—They started a school at Cleobury Mortimer.

5667. But that has an agricultural side to an ordinary secondary school?—Yes, but it is a sort of intermediate grade.

Col. S. T. H. Burne.
4 June, 1907.

Col. S. T. H.
Burne.
4 June, 1907.

5668. It is a sort of technical school with a smattering of agriculture added on. Have you any connection with agricultural education in Shropshire otherwise than through your connection with the Harper-Adams College?—No.

5669. Have you any ideas as to the types of school and forms of instruction that should be offered to labourers? As a practical man, yourself, what would you suggest?—That is a difficult thing to say.

5670. There are certain suggestions, and of course, one wants to hear the opinion of the man who is practically familiar with the agricultural conditions of a particular area?—Well, occasionally, the County Council have had such a small thing as hedge-laying, just a temporary class, which, no doubt, if they can get a good instructor, is valuable.

5671. But what one feels is that such institutions as yours cater solely for the upper class and the larger farmer, and that since you exist in Shropshire your influence and so on might be used to promote a definite system from the elementary school upwards in varying grades suitable to each grade. You have it in your power to stimulate work of that kind?—Yes, to a certain extent. But I don't think you must leave the higher grade.

5672. I should not touch that; but we don't want to leave all the intervening stages alone—the labourer and the small farmer?—No doubt you have the fees of other institutions there, but I do not know of any institution which quite takes students at the same fees as we do.

5673. It would not affect the character of your Institution *qua* Institution. What I suggest would merely be your definitely co-operating with the Local Authority to systematise every grade of agricultural education within your area. I notice one point, that hitherto you have not taken any steps to provide classes for the training of elementary school teachers?—Oh, yes we have.

5674. I am very glad. It is not down here in this Report?—It is not annual. I won't say what we have done; it has been the County Council. When the County

Council wished to have a class of that sort it takes place at the Harper-Adams.

5675. You have never had them continually on Saturdays throughout the year?—No, we have never had that.

5676. That is a point you might consider, perhaps. It has been done at other institutions and has been found to be of the very greatest benefit to the teaching of the locality?—Certainly.

5677. (By Mr. David Davies.) Your staff in the College don't give lectures outside?—Yes, at the expense of the counties.

5678. Is there anything in the nature of evening classes for labourers and farmers' sons?—These lectures do take place in the evening. Some of the horticultural lectures must be in the form of demonstrations and take place in the day. But the lectures given by the veterinary man are always evening lectures.

5679. And they are open to the general public?—Yes.

5680. Then are there any scholarships awarded by the County Council to farmers' sons?—Yes, both counties award scholarships, and Worcestershire is also sending scholars to the College.

5681. Is there an examination before these scholarships are awarded?—Yes, there is. Staffordshire conduct their own examinations, and, I believe, Shropshire do them through the College—the Principal conducts the examinations.

5682. (By Lord Barnard). There are two points which occur to me in connection with the management of the Institution; have you a clerk?—We have a paid clerk.

5683. Does the management of the Institution cost much?—We pay him £50 a year.

5684. Are the whole of the stocks and securities, which are referred to in the schedule of the scheme, in the names of the official trustees?—Yes.

5685. Then you have the great advantage of receiving the dividends free of income tax without any expense whatever in the way of collection? They are regularly paid to your bankers?—That is so.

Mr. PERCY HEDWORTH FOULKES, B.Sc.Edin., F.E.S., called and examined.

Mr. P. H.
Foulkes.

5686. (By the Chairman.) You are Principal of the Harper-Adams Agricultural College, Newport?—Yes.

5687. And formerly you were lecturer in agriculture at the University College, Reading, and science lecturer at the British Dairy Institute?—Yes.

5688. Now you can give the Committee some information with regard to the various courses of study?—I went to the Harper-Adams College as the First Principal with no definite lines laid down to work upon and therefore our courses at first were experimental, and we have gradually worked up into two definite courses as we found instruction was required by those coming to the college. We have practically two classes of students: the farmer's son who has had little or no previous education in scientific subjects, who has passed through an ordinary small Grammar School, has a smattering of mathematics but little or no knowledge of botany, geology or chemistry, and therefore it has been necessary to provide for such students an elementary course in subjects like chemistry, botany, geology before they could take up purely agricultural subjects; for such students our Certificate course is suitable. The second class of student that has come to the College has been more the student who wishes to go in for Land Agency work, or who has had a fairly good education and wants to go in for agriculture. We have had young fellows from most of the public schools who have had a good education and done some science beforehand, and who, therefore, want a different course of instruction from the farmer's son, and we provide for them a Diploma Course on the lines of the National Diploma as conducted by the Joint Board of the Royal Agricultural Society and the Highland Society. Our Diploma Course forms a preparation for the National Diploma. We hold examinations at the end of the session and we award the Diploma to those who pass the examinations which are conducted by external examiners, and frequently our students who are taking the College Diploma go in for the National Diploma. Then in addition to these two Courses, the Certificate and Diploma, we have as a rule in the spring term, that is January to March, a

short course in agriculture for farmers' sons who are unable to leave home for more than a short time. I think I may say that those courses have been fairly satisfactory as they have been taken up by young men of just the type we want to get hold of, young fellows from 20 to 26, who are living at home or on a farm and who come to us with a good knowledge of practical work and who know little or nothing of the theory of agriculture. We have also for those who have taken the short course, what we call an advanced short course, that is extending over sixteen weeks, eight weeks before Christmas and eight after, during the time of the year when a boy can be best spared from home. Those practically are the courses of instruction which we now have built up.

5689. Do I understand that you have one course which takes eight weeks, and which is practical?—Yes.

5690. And that there is another course of sixteen weeks, eight before Christmas and eight after, which is somewhat more advanced but also essentially practical?—That is so.

5691. And what is your opinion of the National Diploma examination?—My opinion of the National Diploma is that it is rather too theoretical and not sufficiently practical; many of the subjects are treated from the theoretical side rather than from the practical.

5692. You say all your students succeeded in obtaining it?—Yes, that is to say our students this year.

5693. (By Lord Moreton.) I think you have been successful in previous years?—We have.

5694. (By the Chairman.) Then the preparation of the students who come for the Diploma Course is good, but the preparation for Certificate work is not so good?—That is so. It takes really a good deal of time to ground the student in the Certificate Course before he can really do the work in the Diploma Course.

5695. Do they come direct from the Elementary School?—No, I should hardly say so. We have had a few direct from the Elementary School, but the majority come from Grammar Schools.

5688b

5696. Is the number of Secondary Schools in the counties of Shropshire and Staffordshire sufficient?—No; I think the general opinion in Shropshire is that there are not sufficient Secondary Schools. There has been a great deal of discussion during the last two or three years on this very point, that there are not now sufficient schools.

5697. And in Staffordshire?—Staffordshire is better provided for.

5698. Then the number of students taken in the College is on the increase?—We have had, I think I may say, a steady increase of students since our commencement up to this session. Our total number has been about 224.

5699. Most of the students are resident during the winter terms?—Yes. We have a larger number because of the short course students, that is those who come to the eight weeks' or the 16 weeks' courses.

5700. You also have a certain number of Certificate and Diploma students?—Yes. They are taking the two years' course.

5701. Are most of them resident?—The majority are resident. We have only three or four non-resident.

5702. And of the short course students the majority are non-resident?—No, they are resident for eight weeks.

5703. And those who take sixteen weeks?—Yes. It is not necessary they should be resident, but most of them come from distances and it would be inconvenient for them to live at home.

5704. No inconvenience to the diploma and certificate students arises from giving those students accommodation?—No; we have had no difficulty up to the present, because our accommodation has not been fully made use of.

5705. But if there is further increase of diploma and certificate students then you would give them the preference?—We should be bound to.

5706. Then who attends during the summer term. Are they chiefly the diploma and certificate students?—Yes, those who are taking the complete course.

5707. And are there any women?—No. During the vacations we have had special classes, or lent our dairy for the travelling dairy schools, but we have not provided definite courses for women.

5708. Is the travelling dairy school under your supervision or under the Council's?—It is under the Radbrook School which is a Girls' technical school. We do the examining. We have had a sort of general connection with the school and we do the examining.

5709. Then I see you have another class of students who spend six months at College after leaving school before starting for the colonies in the spring?—They take the certificate course as a rule.

5710. But they only come six months?—We do not cater for them especially. But perhaps a boy is leaving school and going out to the colonies and he wants to put in the winter months at the College before going abroad.

5711. And does he get a certificate?—No.

5712. But he takes the first part of the certificate course?—Yes.

5713. Then a large proportion of your students are the sons of farmers or landowners or connected with land, and the minority are the sons of business men and professional men?—That is so.

5714. And do the schoolmasters take the certificate course?—They take the nature-study course. We have provided two nature-study courses in our vacations. These vacation courses are held in the years we have our long vacation, which is alternate years.

5715. And the elementary teachers, you have had certain courses for them at the request of the County Council?—Those are the nature-study students.

5716. Only in nature-study?—Yes.

5717. You mentioned that the great drawback is the fact that the farmer will not spare his son for a sufficient length of time?—That is what we have had to contend with most in Shropshire. A farmer wishes to have his son at home as soon as he possibly can after leaving school, and he can thereby not only save a labourer, but his son can be trusted where a hired servant could not be trusted, and it means a considerable saving to the farmer himself. That has been put to me over and over again by farmers whom I have met in the county.

5718. It makes it difficult for them to take advantage of the scholarship?—Yes.

5719. The students who reside in the College work on the farm?—That is so. We arrange our time table so that a portion of every day is devoted to some branch of farm work. We divide the students into divisions so that they may rotate through the different branches of work on the farm—the dairy, the cattle, the workshops and the actual outside farm work.

5720. Do you do any breeding of cattle?—Yes, we breed cattle, so far as our accommodation will permit.

5721. Have you any sheep?—Yes, we keep about 100 breeding ewes, and also fatten off stores purchased each year.

5722. And pigs?—Yes, we keep a couple of breeding sows, and purchase stores for fattening as well.

5723. There is no forestry department?—No, we give no forestry instruction, and I think the class of student we have had does not require forestry, except we have had half a dozen students who rather aimed at land agency work. We have not the staff, neither have we the means of giving instruction in forestry. We have about two acres under horticultural work, and we have an acre under fruit trees, and the students take part in that work.

5724. You also give some instruction in veterinary science?—Yes, we do a great deal of veterinary work. We are almost an exception in that respect. We keep a veterinary surgeon entirely for our own work, and we are able to utilise his services very fully indeed.

5725. Then the field experimental work, that was commenced in 1902, and you have increased it each year, and the interest shown by farmers in that work is steadily increasing?—Yes, we started in 1902 really at the request of the Staffordshire Farmers' Association, who sent a deputation to the College. Since then we have developed on other lines of work they have asked us to carry out. That has been taken advantage of by the farmers very largely indeed in Shropshire, and the same men come year after year, and that, I think, is a proof that they do appreciate what they see, otherwise I don't think they would give up their time at a busy season and spend a whole day on the farm. Variety trials have proved extremely popular.

5726. And as a result the enquiries for seed have been considerable?—Yes, each year we have had a considerable demand for seed from our plots. Over £200 worth of seed has been sold off the farm in a season to farmers in the counties after their visits to the College.

5727. You say "parties of farmers are organised by different agricultural societies," so that you have more than one?—We have a number of small societies scattered over Shropshire and Staffordshire, and those societies organise parties; they come and bear the whole cost of their visit and spend the whole of the day on the farm. Then we have a number of landowners—Lord Barnard is one—by whom parties of tenants are organised and come to the College and spend the day with us.

5728. And I see that the Shropshire Chamber of Agriculture paid you a visit last August, and then adopted a resolution?—Yes. I thought that might be of interest to you as showing what the Chamber of Agriculture thought of what they saw. That was the second occasion on which the Chamber visited the College.

5729. Perhaps you will give the Committee the terms of the resolution?—The resolution was:—

"That this gathering of the Shropshire Chamber of Agriculture, consisting of something like 100 landowners, land agents and farmers, in visiting the Harper-Adams College for a second year heartily appreciates the work which is being done to assist the farmers of Shropshire by carrying on experiments, etc., which visitors are able to see on visiting the College; and that a copy of this resolution be sent to the Salop and Stafford County Councils, and to the Board of Agriculture, in view of the support which they give to the College."

5730. Then you also carry out field trials in Shropshire and Staffordshire?—We carry out the work in Shropshire entirely, but in Staffordshire we work in conjunction with the agricultural instructor, as before our College was started he had been carrying on experiments at a number of centres. It was thought we might co-operate, and we jointly plan out the experiments at the College and he carries them out in the county.

5731. And on these field trials you disseminate bulletins and complete reports?—Yes.

5732. And you circulate those free amongst the farmers?—Yes, in the two counties.

Mr. P. H.
Foulkes.
4 June, 1907.

Mr. P. H.
Foulkes.
4 June, 1907.

5733. And you find, I suppose, they are very eager to get them?—Yes, this year we have had more enquiries for copies of the reports than we have ever had before. The Staffordshire County Council sent out about 1,500 from the County Office, and we distribute them in Shropshire, and anyone who enquires for them can have them free.

5734. Then in 1902 an arrangement was made between the Shropshire and Staffordshire County Councils and the College for delivering county lectures by the staff in veterinary science and horticulture?—Yes, that was an arrangement started in 1902, because in Shropshire they had no lecturer in veterinary science, but they had had a lecturer in horticulture, and the Technical Instruction Committee, then in existence, thought it would be desirable to work in conjunction with the College, and since then our staff has been engaged in this work.

5735. That applies to Shropshire?—Yes, and to Staffordshire in respect to veterinary work. In horticulture the County Council have had a lecturer of their own for a number of years, long before the College was started.

5736. And in Staffordshire there is an agricultural instructor, and he gives the lectures?—Yes, he gives agricultural lectures.

5737. But in Shropshire there is no agricultural instructor?—No.

5738. So there are no lectures?—I, myself, have given a few at some of the societies. I might say I greatly regret that there is no lecturer, because the agricultural lecturer can do, perhaps, more good than the veterinary or horticultural lecturer in bringing the College into touch with the farmer.

5739. Then at the request of the Staffordshire Farmers' Association a seed-testing station was opened?—Yes, that was done in 1903.

5740. Was that opened at your College?—Yes; it is purely college work.

5741. I believe, at the request of the Board of Agriculture, in 1905, arrangements were made for testing milk?—Yes. That was in accordance with the scheme drawn up by the Board to enable farmers in the various counties to get their analyses done at a nominal fee.

5742. And your students, I suppose, also take a share in that work?—Well, they do analyses on their own account; but we do not allow them to touch any samples that come in for testing.

5743. They see it done—I mean as to the experience, and its educational value?—They see it done, oh, yes; and in the same way in regard to analyses in the laboratory, they see the work.

5744. Are your laboratories sufficient?—Yes, our laboratory is sufficient as regards size, but I am sorry to say it lacks equipment. We have no gas, for instance, and that has been a great drawback to our doing, what I may call, first class analytical work.

5745. You'd like more money?—Yes. It is what our Governors have considered for the last three or four years—the instalment of the gas; we have not been able to see our way to do it.

5746. Then analyses are carried out at the request of farmers?—Yes, we have enquiries from farmers who will not go to the trouble of carrying out the details required under the Fertilizers and Feeding Stuffs Acts. They come to us and bring samples and say they would like to know whether they are on the safe side, but they will not take the samples in the proper way and have witnesses; but for their own satisfaction they want to have an analysis made.

5747. But you cannot always accept their invitation?—We refuse a large number of samples because we have only one chemist, and he has a good deal of teaching work to do.

5748. So that you think your College ought to receive more support in order that that work may be efficiently carried out?—I certainly think we could do much more if we had the means.

5749. The staff ought to be increased with a view to the performance of this part of the work?—Yes, I think so.

5750. Then you are also asked for the identification of pests and diseases?—Yes, we have numerous enquiries from farmers as to diseases, questions of manure, use of feeding stuffs, etc.

5751. And you give them such help as your means will allow?—Yes.

5752. Then for the benefit of the small agricultural

societies in Shropshire, the College staff has given demonstrations at the shows in butter-making, soft cheese-making, poultry dressing, and also horticultural demonstrations?—Yes, we have done a little in Staffordshire as well, although the work has principally been in Shropshire. In Staffordshire they have their own travelling dairy school, and their instructress at the principal shows has given demonstrations, so that work has not come through us.

5753. I suppose you are well pleased with the fact that the County Council have now appointed a Joint Committee. You expect that will be a benefit to the College?—I think it will be the means of bringing us into more intimate contact with the two County Councils. We have been rather looked upon as a separate organization. Although you will see that we have representatives of both County Councils, still we have not been in that close touch with the County Councils that, I think, is desirable in an institution of this sort.

5754. And the result generally is that the farmers show a steady increased interest in your welfare, and during last year you received visits from 600 farmers?—Yes, that is the largest number of visitors we have had.

5755. And those who have made a visit once repeat their visit another year?—Yes.

5756. Showing that they have benefited by their visit?—I think so.

5757. (*By Lord Barnard.*) This Institution differs somewhat from a great many of these institutions established elsewhere in consequence of the fact that it has not been established by the public at the public expense, but it is what is technically known as a charity?—Yes.

5758. And, naturally, subject to certain trusts, so that your operations are practically limited by the trusts of the scheme and can only be altered in conformity with the law affecting the trusts?—That is so.

5759. One of the conditions, I believe, of this scheme is that no student shall be admitted under the age of 14—have you any students as young as that?—We have not, because the Governors, after the College was started, raised the age limit to 15. But as a matter of fact the average age is between 18 and 20.

5760. I heard you say something about young men over 20 coming to attend short courses?—We have had students over 30.

5761. Have the Governors fixed an age for leaving?—No.

5762. Take a certificate course, for instance, what age do they come?—About 17, but we have had younger pupils than that.

5763. Do they come direct from the secondary schools?—Sometimes, and sometimes after having been on a farm.

5764. I should like to know what your view is with regard to a farmer's son attending your college, on two points: one is whether you think that it is best he should have a good general education, or should he have had any preliminary training in special subjects?—I think the good general education serves a young fellow much better than a specialised one.

5765. You wouldn't have them taught any special subjects?—No, we can do it better.

5766. The other point is, do you think that these young men should come to you immediately on leaving school, or do you think it is advisable that after leaving school the boy should spend a year or two helping the farmer?—Well, so much depends on the individual. Speaking broadly, I'd rather a student came to us after he had been on a farm. But the drawback is when a young fellow of 17 has been at home for two years he has lost touch with his books.

5767. Particularly in mathematics and science?—Yes.

5768. Then I see the object of the founder is practically carried out, except in one direction, and that is a very important one. The scheme gives no effect to the founder's intention to educate women, I don't know why?—I think that may be answered by the fact that Shropshire has an institution intended purely for women and girls at Radbrook, near Shrewsbury. It was founded under the Preston Hospital scheme.

5769. The object of the foundation is to teach practical and theoretical agriculture to youths?—Quite so.

5770. You, of course, aim at educating the practical farmer very largely, but you don't exclude, I hope, many allied occupations and more particularly the teaching of the agricultural profession?—I think I may almost say some of our best students have been the sons of professional men and they have done best at farming afterwards.

5771. You are in close touch with your profession?—I think I know most of those engaged in teaching work.

5772. You will agree with me when I say at the present time there is a great demand for highly educated scientific agriculturists all over the world?—Yes. When we want a new member of staff it is sometimes very difficult to get hold of one.

5773. Colonel Burne told us that many of the staff when they show a faculty of becoming highly skilled are drawn away to other parts of the world—in fact you can scarcely keep your teachers?—That is so; and that I think is solely due to the fact that the salaries offered outside are very much higher than we can offer.

5774. Have you been associated with farming all your life?—I am the son of a land agent, and I have been brought up on a large estate.

5775. Do you go about a great deal?—I did at first, but during the last three years my time has been so fully occupied in the College that I have not been able to do so.

5776. You mentioned the importance of keeping in touch with farmers, don't you think the best way is to keep in touch with agricultural shows and address them?—Yes, and I regret that I have not been able to do more of that work myself. I have lectured at one or two meetings, but not as much as I should have liked to have done.

5776A. Of course I suppose I am right in saying that a great part of Shropshire farming is of a very first-class order?—I think there are few counties to touch it.

5777. And a great part of the agricultural district is of the ordinary mixed farming, and on the north and Cheshire side dairy farming is carried on?—There is a great deal of milk and cheese made, but more on the Cheshire side.

5778. Will you tell us what your farm is?—It is a mixed farm. We have kept it entirely mixed for teaching purposes.

5779. Do you study the special breeds of the county, Hereford cattle and Shropshire sheep, or do you extend your operations into other breeds?—We have gone into other breeds, but we have kept the Shorthorn breed as typical for milking, with representative specimens of other breeds for teaching purposes.

5780. You mentioned pigs; I think, so far as the labouring classes in the district are concerned, the pig is looked upon as of very great value and importance?—That is so, in our district particularly.

5781. You also mentioned the subject of forestry. You told us that the number of young men who went in for forestry was somewhat limited. You are aware, of course, that Bangor College has now a forestry class, therefore if a man wanted to start in forestry, it would be a pity to start a class at Harper-Adams?—Yes, I think we can do better in other directions.

5782. The point I want to bring out is this, that all these institutions should be more or less co-ordinated?—Yes.

5783. Then on the subject of veterinary work, I suppose you only teach the merest elements?—We don't attempt to make veterinary surgeons of them. We try to give them a good general knowledge of animals, such as is useful to a farmer.

5784. You are not trenching upon the province of the veterinary surgeon?—Oh no, not in any way.

5785. Have you any good farm buildings?—Very good indeed. They were finished in 1900, just before the College opened.

5786. You have also told the Committee about the analyses you make. You told us that practical farmers preferred the more informal operations which you carry out to the elaborate formalities required by the Act?—Yes.

5787. We have been told one reason why farmers go to the colleges is that they can get general information as to the result of the analysis?—It generally opens up correspondence. They want further information, and it leads to giving results of experiments that have been carried out, etc.

5788. By analysing fertilisers and feeding stuffs, you are generally extending higher agricultural knowledge?—I think so.

5789. There is only one more question I want to ask about the students. The official Report says, "In addition to these counties, students come from other counties." Are you aware whether they come by scholarship from the County Council?—I always know whether a student has a scholarship.

5790. That is to say, supposing a County Council of some other county gives a young man a scholarship and says, "You must hold this at some institution approved by us," he might select yours as well as any other?—Well, we have had instances. We have had them from Lancashire; we have now two Worcestershire scholars with us.

5791. Would you agree with me that the general line to be adopted in the case of such an institution as this should not be "locked up," but that it should form part of one general system over the whole of the country, your College should be part of the educational system of the country?—I certainly think a general system would be better than working in isolation.

5792. I see the scheme says the school is open to all boys if there is room; if there is not room preference is to be given to these who are resident in the county of Salop?—That has never come into force.

5793. I do not know whether you care to answer this question, but have gentlemen in your profession any association or means of inter-communication, such as is afforded by the Headmasters' Conference and the Conference of Masters of Secondary Schools, and the Conference of Teachers in Foreign Languages?—Yes, we have a very strong organisation, namely, the Agricultural Education Association. Formerly it consisted of the Heads of Agricultural Colleges and Departments, but now it is open to all the profession.

5794. Do most of them belong to it?—I think so with very few exceptions.

5795. By means of that Association you can get on with this co-ordination?—We do. We have annual meetings. For eighteen months I was honorary secretary of that Association, so that I know the working of it.

5796. (*By Lord Moreton.*) What size is your farm?—We have 180 acres of our own, and we have taken another 50 on a 21 years' lease.

5797. I hear you have not done anything towards teaching any labourers on the farm?—No, we have done nothing with the labourers.

5798. We have heard a good deal about the veterinary work. Has your College done anything as regards farriery?—No, beyond what we do in our own blacksmith's shop with our veterinary surgeon.

5799. Has that ground been covered by some other body?—No. I tried to get the Shropshire Committee to undertake such work, but owing to the expense they would not consider it.

5800. (*By Mr. Latham.*) I should like to ask you to give us a little more information as to how you give his private advice to farmers?—By correspondence and by visits. I mean a man will come over, or he writes. I have a few letters of enquiries here which will give you an idea of what we get. Here is a telegram: "Man made a mistake dressing wheat; put two lbs. bluestone, will it interfere with growth?" Here is another: "I shall be greatly obliged if you will kindly say what your opinion is after the experiments you have made as to the relative value of superphosphate and slag." Another letter was with regard to the identification of some barley samples.

5801. This is rather outside what you might give lectures on?—Yes. Here is one, quite an exceptional thing. A man had a field of three acres of permanent pasture badly affected with smut. That would hardly come into an ordinary lecture.

5802. (*By Dr. Somerville.*) You mean a pasture field?—Yes.

5803. (*By Mr. Latham.*) Have you had any application to give any advice on the milk standard?—From whom?

5804. From farmers?—Well, we are consulted with regard to samples sent in, but hardly to give advice as to a milk standard. Perhaps I don't quite follow what you mean.

5805. It is a very vexed question by many that the milk standard is not right, and at Reading we have taken a lot of trouble to keep a record of tests. Have the farmers in your district taken any interest in getting scientific knowledge from you as to how milk may be judged?—Oh, yes. For instance, a man will send a series of samples to us to get an idea of what the individuals of his herd are giving, and what the average of the whole herd is. We had a case close to us, near Wellington, where a man was prosecuted for selling milk below the standard. He came to us for assistance, and we sent our instructor over who took samples both night and morning, and we were satisfied that it was a case of the animals—it was "an appeal to the cow."

Mr. P. H. Foulkes.
4 June, 1907.

Mr. P. H.
Foulkes.
4 June, 1907.

5806. Were the tests of value to him?—He got “off.” That was of practical value to him.

5807. Has he improved his system since?—I have never heard that he has been prosecuted since.

5808. So far as those tests are concerned you have nothing of the sort going on?—We keep a regular record of our own cows.

5809. Not anything as regular as that form (*handing to witness test cards*)?—We send out milk test certificates of analysis in a different form to these. We have bigger variations. Only on Saturday one of the cows was giving as low as 2.5 per cent.

5810. Don't you think something of that kind is of very great value?—Yes.

5811. That is what you might term private advice to farmers?—Yes.

5812. Now could not that sort of thing be lectured on?—Very well, indeed.

5813. Speaking just now of the students you said that they were very much better if they came in an advanced state of education?—Well, instead of using the word “advanced” I would say “good general education.”

5814. Such as the ordinary farmer's sons have, or in advance of that?—No, what an average farmer's son ought to have.

5815. What the ordinary farmer's son ought to have and what he does have are two distinct questions. Which do you find they have had?—I am afraid it is not always the first.

5816. Is that because you are short of secondary schools in Shropshire?—I think, very often, it may be due to that.

5817. You spoke of the outside examiners. Have you found outside examiners a success or not?—I think a decided success. It makes our diploma of more value than if it was awarded on examinations conducted by the teacher.

5818. You have nothing to say against him?—No, because he works in conjunction with the teacher.

5819. With regard to farmers' sons you said you had them between 20 and 26 years of age, and you said as high as 30?—In exceptional cases.

5820. But what have they been doing until they get to that age that they have not thought it necessary to get scientific education before?—Well, I have a case now of a young fellow who had been at home for a good time, and when he found it was possible to take a scholarship, he came to us last autumn. He is 25, and is a farmer's son, his father having a farm of 150 acres.

5821. In looking through this description of your College, which is very interesting, I asked that question because I see you have many visitors. Are these young men who come to visit you and then think they would like some education?—Yes, in some of the cases.

5822. That is how they, presumably, first know what is going on?—It is sometimes the only means they have, because they don't read our reports.

5823. You made the remark that some of the farmers were very loth to part with their sons because they were assisting them on their farms, is that so?—That is so.

5824. And then those men can be spared when they get to the extra age to come to you?—Yes, in exceptional cases. I can hardly say that has been the rule.

• 5825. That has been the exception, not the rule?—Yes.

5826. You, perhaps, may be loth to say anything about this women's college in Shropshire. It is rather a good thing, is it not?—The Radbrook School has done very good work, indeed. Their work is more domestic than of an agricultural character. They do a certain amount of dairy work, and a member of our staff has gone from the College to give instruction.

5827. That is supported a good deal by the County Council?—That is so: by a grant and by scholarships.

5828. Yours is one of the few counties, I think, that are fortunate in having two centres—one for males and one for females?—I do not think there is any other county that has two endowed institutions of this kind.

5829. That accounts for the fact that women do not get education at your centre?—That is so.

5830. In looking through this book, I see you are showing the reaping and the different things with young men around, are they students?—Yes, under our farm steward.

5831. Are they students?—Yes, they are all students.

5832. Now a little further along you are showing hedge-making. Are they the students again?—That happens to be a group of short course students, there for eight weeks.

5833. These are young men that are taught rather the practical line than the scientific line, or is it in union?—There is a certain amount of both, but it is more of a practical character.

5834. Have you a large number of entries for that course?—We have not had very many. The number is from six to nine for each course.

5835. Referring to your teachers, who teaches this class of work?—We have a farm steward, a man who was for many years farming the adjoining farm, and was a very successful farmer. Fortunately for us he was retiring from his farm, when the College was started and we took him over.

5836. Is that Mr. Vaughan?—Yes.

5837. What sort of scientific agricultural education has he had?—He has never had any; he is a man who has read a great deal, but he has had no scientific instruction.

5838. So that he is quite a practical man?—Purely a practical man.

5839. Why I asked you that first question was that I saw in your curriculum milk testing, and I wanted to ask how far you had carried it out and whether you had carried it out on scientific lines?—Yes, we have. We keep a definite record of all animals in the herd.

5840. With regard to the feeding stuffs and manures, how far do you go?—For ourselves, do you mean?

5841. No—For outsiders? Fully.

5842. You say many of the farmers cannot take the time to go into details, but at the same time they wish to have some idea of what they are buying; do you give them a full analysis?—If they want it we give them a full analysis, but as a rule all they want is the oils, fats, and albuminoids in the case of a cake, and one or two of the constituents in the case of a manure.

5843. I suppose you simply say this is a good useful cake?—Yes, and probably work out its comparative value.

5844. Then you go on to say owing to the limited staff this work has not been made widely known. You do not court this sort of work?—We cannot, because we do not like to refuse when we are asked, but at the same time we have not the staff to undertake a great deal of it.

5845. Then if you were lucky enough to get an increased grant you would be very pleased to enlarge this side of the question?—We should.

5846. To what extent are these enquiries made upon matters relative to the farm? What enquiries do you get? You say “Enquiries from time to time are being made on matters relating to the farm”?—Enquiries relating to things we mentioned just now—manures, feeding stuffs, insect pests.

5847. With regard to food stuffs, do you feed your own cattle and give results?—Yes, we have carried out experiments, not only on our own land, but also at the request of the Staffordshire Farmers' Association.

5848. I presume you carry out experiments with manures on pasture land for sheep?—Yes, we have carried out breeding experiments, the production of early fat lambs, for instance.

5849. On certain pastures?—Not by certain manures.

5850. To what extent do you do the other?—To a considerable extent.

5851. Is it from nature or from scientific research? Are your results what you get from the land in a natural way or are they from scientific research?—I think we may say both.

5852. Can you give us any particulars as to your seed-tests, and to what extent it is carried on?—We have tested about a hundred samples a year on an average, I should think: some years more, some perhaps less.

5853. Is that to show the germinating power?—The germination and purity are the two things we aim at showing.

5854. Do you find the farmers in the counties anxious to get evidence from you on that particular subject?—

Mr. P. H.
Faulkes.

4 June, 1907.

It is varied.* In some years we have had a good deal of enquiry. Some three years ago we had a large number of samples sent in.

5855. I want to ask you to give us a very general answer to this question, that is, provided scientific education was offered more freely to farmers, on what particular lines would you advocate it. Of course you are well aware that there has been a very adverse feeling with regard to scientific teaching. Provided there is a good feeling coming round, I want to know what would be the principal good to the agriculturist of this scientific teaching?—I think by giving him facilities for obtaining more information as to the matters with which he is continually coming into contact. I mean more information as regards the use of manures, more information as to the analyses of food-stuffs, seed tests and milk tests.

5856. You think that certainly the scientific education of farmers would tend to get more value out of the soil?—I see no reason why that should not be the case. The more information he can get on the subject the better for him.

5857. Have you any experiments going on in your county with the successive growth of corn?—You mean growing year after year the same variety? None.

5858. Have you any experience yourself?—Only what I have seen at other institutions.

5859. You have never visited such a place as Mr. Prout's?—No, I have never seen his farm.

5860. (By Dr. Somerville.) Do you exact an examination fee for diploma?—No.

5861. I notice both your diploma and certificate course extends to two years?—Yes.

5862. But I also notice that a considerable number of men who are entered as certificate students are in their third year, and a very considerable number of Diploma students are in their third and fourth years?—Not a considerable number, but a student may stay three years to pass the examinations.

5863. Well, 20 per cent. in the case of the diploma, that is to say, five out of 23 in the case of the Diploma Course and five out of 20 in the case of the certificate?—Well, in the diploma course the Staffordshire County Council award their scholarships for three years, and if a student comes who is not able to take it or do the work of the first year Diploma Course he then goes into the certificate for the first year, and takes two years in the Diploma afterwards.

5864. It is not a case of "lame ducks"?—No; we have also men who are going in for the National Diploma who have to take two years for the first division.

5865. A considerable number of subjects are common to the two courses, are they not?—Yes.

5866. Are book-keeping and veterinary science, for example?—Yes.

5867. A man appears to get more agriculture who goes in for the Certificate Course than if he goes in for the Diploma Course?—Well you see he has more time.

5868. Can you tell us roughly what your proportion of passes is?—For the Diploma?

5869. For either?—I cannot offhand.

5869a. The bulk got through, I suppose?—Yes.

5870. I suppose you would persuade a man not to go in if you thought he could not get through?—Yes, we find out from the first year's course.

5871. You know the sort of experiments proposed by Agricultural Education Association, have you put that scheme in force?—Yes, we have reported upon the four years meadow land on the lines laid down; we have also carried out experiments in swedes and mangels.

5872. Do you believe in the system?—Yes, and I should like to see it developed more; there should be more co-ordination.

5873. You are well aware these schemes were prepared after very careful consideration by the men who are interested in the work, and you are also aware they have not been adopted to the extent anticipated?—Yes, I am.

5874. One more question. Do you find the farmers are taking advantage of these cheap tests for milk?—Yes, I think there is an increase in number. We only started in 1905. We had 92 up to the year ending March 31st, 1906, and in the year ending March 31st, 1907, we had 136.

5875. I suppose most of the demand for information

under this system is with regard to the mixed milk of dairies, and not so much as regards the qualities of individual cows?—It is more mixed than individual.

5876. Have you any farmers trying to weed out their poor animals and to build up a high-class milk strain?—Yes, we have two or three. One man with every animal he buys at once sends a sample to us to test.

5877. You find farmers are alive to the advantages of ascertaining what their animals are doing, and proceed to weed out and build up from the knowledge ascertained?—I think that is slowly coming in.

5878. (By Mr. Medd.) How many students have you at the present time in each of these courses?—How many are there to-day in the Diploma Course?—A much larger proportion in the Certificate Course than we have in the Diploma. I cannot give you the figures.

5879. Perhaps you will kindly send them on?—Yes.

[The witness subsequently informed the Secretary that the figures asked for were Diploma 6, Certificate 27.]

5880. Now you mention that students come to you at the age of 15 and you have some at the age of 30, in what course would these men over 20 be?—Some are in the certificate course and some are in the diploma course; they are in both.

5881. Don't you find it very difficult to classify them satisfactorily when you have them at very varying ages?—Not so much in the Diploma Course. The difficulty is in the Certificate Course, because they vary so much in previous education.

5882. Now with regard to the younger students, are they fairly well prepared when they come to you at 16?—They vary very considerably.

5883. In what are they mainly defective?—In mathematics.

5884. Have they, as a rule, done any elementary science?—Not as a rule.

5885. When they have, has it generally been satisfactorily taught?—Well, on the whole I should say "No."

5886. You probably prefer pupils coming to you having had a thoroughly good general secondary education?—Yes.

5887. Have you had any pupils from Cleobury Mortimer?—I think we have had one.

5888. Who has been through their agricultural course?—No, he has not. I think they have done very little on that side recently.

5889. Probably you wouldn't care to express any opinion as to the agricultural side?—No, I would rather not.

5890. Do your students attend Shrewsbury Market at all?—Yes, but they attend Newport regularly.

5891. Is it as good as Shrewsbury?—There are not as many animals going there.

5892. Do they sell at Newport by live weight?—No.

5893. Do the students study the market records?—Yes, and they have the information given in the regular class.

5894. Have your staff ever given lectures to farmers on market days?—No.

5895. What is your position to-day in regard to the training of teachers? Have you any current course?—No; we have not. The only time we are able to have a course of teachers is in the long vacation, and that only in alternate years, because we have an exceptional arrangement with our summer term in order that students may be on the farm during the two harvests, that is hay and corn. We divide our summer term into two divisions, and while the one year the student is with us through the hay harvest, that is up to the middle of July, in the following year he is with us to the end of August; so that it is only in alternate years we have a long vacation.

5896. I know you have had courses and they have been very satisfactory, do you think it would be possible for you to arrange a course to be held continuously on Saturday afternoons?—Not with our present staff.

5897. With regard to the remark of Lord Barnard that women students might under the will of the testator be admitted, is it not a fact that at Radbrook School they have no horticultural instruction?—That is so.

5898. All they have in the way of open air instruction is a little dairy work?—Yes, that is so.

5899. So that Radbrook does not provide in any way for the horticultural instruction of women?—Not at all. But the terms of the will were housekeeping and dairying and other subjects.

5900. Can you give a brief account of the work of the Agricultural Education Association?—Well, the work has

Mr. P. H.
Foulkes.
4 June, 1907.

consisted really in drawing up a scheme of experiments. It has also held Conferences. We have an annual meeting, and discussions take place, papers are read by members on recent research work which has been conducted by the different colleges, also papers are read on topics relating to educational matters, teaching subjects and so forth. Then visits are paid to the principal experimental stations. For instance, we had a Conference two years ago at Bedford when we visited Rothamsted and the Royal Agricultural Society's farm, and papers were read.

5901. How often does the Association meet?—Every year. We have a winter meeting and we have a Conference, which generally lasts for three days in the summer.

5902. Is that well attended?—It has been very well attended.

5903. (By Mr. Davies.) How many short course students go on after they have finished their short course? Do they proceed to take the Certificate Course?—A few take it.

5904. I suppose they have scholarships?—Yes. It is difficult for them to leave home. They come to us for a short time: the parents allow them to come in the winter months, but not in the summer months.

5905. Then a good many, with advantage, could take the Certificate Course?—A good proportion.

5906. What proportion of students in your College are awarded scholarships before they come there?—On an average about a quarter, and it is less than that sometimes. We have had it as low as a sixteenth.

5907. What proportion of these scholars come from the counties affiliated to the College?—From three-quarter's to two-thirds, I should think. I don't think we have ever had more than one-third from other counties.

5908. So that the farmers in the counties are really beginning to realise the advantage of sending their sons without scholarships?—Yes, I think so, and I think that is largely due to the fact that they do not know of the scholarships. I have had this difficulty. At some schools the headmasters are rather averse to putting the information that there are scholarships before their pupils for fear of losing them at the ordinary school age. I can give you an instance where a student came to us: his father was bailiff on an estate, and just the kind of man whose son would benefit. He was at one of the secondary schools in Shropshire, and although that school had had information that there were scholarships, it had not been put before the scholars, and it was only by chance he heard of it. I think if we could get more in touch with the secondary schools there would be a wider distribution of information.

5909. I understand there is an examination before the scholarship is awarded?—Yes.

5910. Then with regard to the practical work carried on at the farm, do you pay your students for the work they do on the farm?—No.

5911. Do you teach the history of agriculture as a part of the course?—They get a certain amount of history taught.

5912. But as such it is not an integral part of the course?—No.

5913. What is your opinion about it. Do you think it could be brought in?—I think it might for Diploma students, provided they had more time. The difficulty is in getting all the subjects taught in the two years during the time they are at College. We are obliged to confine ourselves to the actual workaday subjects.

5914. You told Lord Barnard, with regard to forestry you did not consider it advisable for you to have a professor of forestry in your College?—I don't think we should be able to give him enough work. We could devote the money to better use in other directions.

5915. What about the two counties outside? Is there not a good deal of work to be done in the way of giving advice and so on? A lecturer might go through two or three counties giving advice and the fees being paid to the College for his advice. I should think there are opportunities for a good deal of that class of work?—Well, not so much as in the counties which support the Bangor College. Shropshire is more of an agricultural county, and there is more farming than there would be afforestation. I quite agree with you that a great deal of good might be done in that direction.

5916. I mean not so much in-college work, but outside work?—Yes.

5917. You think there is scope?—For advice, certainly.

5918. With regard to your old pupils, when they leave the College, have you any organisation through which you are able to keep in touch with them?—I have done it personally, but we have no organisation. I have kept in touch with a very large number by correspondence.

5919. Do you think that is a part of the College life that might be more developed, so that you would be able to interest farmers more in the counties?—Yes, I think so, and as we go on I think we shall be able to do something.

5920. I think you told the Committee that Staffordshire has a lecturer of their own?—Yes.

5921. Is he responsible to the College?—No, he is responsible to the County Council of Staffordshire.

5922. You have no control over him?—No, except he has been made an honorary member of the staff of the College, and he comes to lecture there one day a week, so that he can be kept in touch with us.

5923. Would it be advantageous if you had some form of control over his movements, and the way in which he works?—I think perhaps, it would be better, generally for all county work to be carried out through one institution.

5924. With regard to the demonstration class, I think you told the Committee that the College had plots in different parts of Shropshire, and are these plots migratory or stationary?—They vary from one season to another, though very often we carry on at the same centre for three or four years.

5925. Do you find the landlords are willing to carry on the work free of charge?—Yes, we have had no trouble at all. We pay nothing. We find all the manures and seed, and they find the labour.

5926. Do you find the farmers come and look at the experiments when they are being conducted?—Yes, and a great deal of interest is shown.

5927. If the Board of Agriculture had more money to spend and were able to increase your grant, in what way would you spend the money?—I think the question of the salaries of the staff would be the very first thing we ought to consider, and an increase in staff would be next.

5928. So that you would really strengthen the existing staff and the existing work rather than branch out into anything fresh?—Well, we should like to do both.

Professor LLOYD MORGAN, LL.D., F.R.S., called and examined.

Professor
Lloyd Morgan

5929. (By the Chairman.) Professor Morgan, you are the Principal of University College, Bristol?—Yes.

5930. A Sub-Committee of the Faculty of Arts and Science was recently constituted to deal with the subject of Economic Biology?—That is so.

5931. Perhaps you will give the Committee its constitution?—The Sub-Committee of the Faculty of Arts and Science is composed of Professor Stanley Kent, who is Professor of Physiology; Professor Francis Francis, who is Professor of Chemistry; Professor S. H. Reynolds, who is Professor of Geology and Zoology; Professor Cowl, who is Secretary to our University Committee, that is the Committee having for its object the forwarding of the claims of

Bristol for a Charter; Mr. Priestley, who is the Lecturer in Botany, and two readers in Economic Biology, Mr. Barker, of the National Fruit and Cider Institute, and Mr. Bolton, the Curator of the Bristol Museum, with myself, *ex-officio*, as Chairman of the Faculty of Arts and Science. The Sub-Committee of the Faculty was formed so as to correlate the work which is already in progress and is in any way in touch with agricultural education, and to consider the best means for its further extension. A certain amount of work has been carried out for some little time, would you like me to indicate the nature of that work?

5932. Please—I may say that Professor Stanley Kent, the Professor of Physiology, has been consulted with regard

to certain avian tuberculosis which is prevalent apparently in Somerset. That is being dealt with by Mr. C. E. J. Walkey, Instructor in Poultry Keeping under the Somerset Agricultural Instruction Committee, but Mr. Walkey felt that he was unable to carry it out quite upon the lines of bacteriological research, and therefore called in Professor Stanley Kent to help him in that connection, and he is at present at work upon the matter, considering methods of disinfection and considering whether the disease can be transmitted to the offspring in the egg, whether the chickens are born with disease, at what age the disease first appears, and so forth. That is the work which Professor Stanley Kent is at present engaged upon. Professor Francis has been asked to give advice upon insecticides by a farmer in Somerset. I may say that the farmer is one of the past students of University College who had himself worked in the chemical laboratory and is carrying out certain observations himself and wanted more technical advice, and therefore came to Professor Francis. I may say that that partly arose out of the fact of our having this Sub-Committee. Then thirdly Mr. J. H. Priestley, Lecturer in Botany, has been carrying out experiments on the inoculation of beans with nitragin and comparing the American and German methods. He has been making trials with cyanamide checked by chemical analysis, and he has carried out investigations himself and has been in touch with investigations by others on the effects of electrical stimulation, and he has brought together the results which have been obtained in our neighbourhood and thrown them together into a paper which will be published by the Bristol Naturalist Society. The experiments of Mr. Priestley have been on a comparatively small scale; but other investigations with which he is in touch have been on a considerably larger scale. I may say that in connection with University College there is a small botanical garden of half an acre, and a nature study garden of 12½ acres at Brislington, near Bristol, and it is in this nature study garden that a certain amount of experimental work is being organised by Mr. Priestley. Then there is work in connection with others on regional surveys in Somerset and Gloucester dealing with the habitats of plants and their relation to the geological structure and surface soils. And, furthermore, there are some investigations carried on by Mr. Priestley and his students on heredity in *Trifolium*. Those investigations are only just beginning. The original work of Mr. Priestley has also been on lines which perhaps might be scarcely considered in touch with agricultural work, certain physiological researches on carbon production in plants that have been published in the proceedings of the Royal Society and which were spoken well of by the President of the Chemical Society (Professor Meldola) in his presidential address. He feels, and I confess that I feel, that such research may have quite distinct bearings upon agricultural work. It is difficult to say where research carried out in connection with such a subject as botany is going to end, and how far it is to be merely academical, and how far it is to be applied. The work to which I have drawn your attention is, shall I say, preliminary work. I don't pretend that that work goes very far, but it is work upon the lines of research, and it is work which those who are in touch with agricultural work apparently are interested in. And my own feeling very strongly is that the kind of work which we should do in the future, and to which I will allude in a few moments, should be centred in research and in the advisory work which would naturally arise out of research. Then, to go to a different point, perhaps I may mention that the Museum Committee under the Bristol Town Council are quite ready to co-operate in such work, and are forming an exhibit on economic biology at the Bristol Museum. That, again, is in its infancy, but it will be constantly in touch with the work of this Sub-Committee of the Faculty of Arts and Science, and our object is to give an opportunity to those who want it to become acquainted through these exhibits with the nature of insect pests and so forth. Well, in regard to the projected lines of development, our view is that, at any rate for the present, the work of the Department of Economic Biology should be for research and for consultative and advisory purposes, and in touch with work which is being carried out in the neighbouring counties and constantly based upon investigation and research. That is to say, our conception is that the teaching and training of agricultural students is not the work which we have immediately in contemplation. We think that that should be carried out in agricultural colleges. Not that there should be no teaching or training in connection with the work of this Department, but rather that the teaching and training which there is should be for the experts and for those who are going to be in touch with the work in the counties around. Then we hope to be in constant co-

operation with such work as is undertaken at the National Fruit and Cider Institute, and at the experimental stations in neighbouring counties. It is unnecessary for me to say anything about the work of the Cider Institute, but it seems to me that with the staff we have at the University College there ought to be opportunities for help afforded to Mr. Barker at the Cider Institute, and that Mr. Barker will also afford some facilities for us, and I think it is quite possible that among our students some may be induced to take up research work so as to aid Mr. Barker in the work he is carrying out there. It has been suggested to us that there are openings for helpful assistance in forestry, and especially it has been suggested lately, in watching fruit importation and the introduction of noxious insects. Of course there is a large amount of fruit importation at Bristol, and we understand that in some cases some noxious insects have been introduced. Then, looking to the future, we hope that, when funds permit, there should be appointed a director, possibly with the title of Professor, as head of the department, whose duty it would be to render assistance and give advice to farmers and others, and to correlate research work and its economical application. The lectures and teaching, if any, should be kept wholly subordinate to research and consultative work. I say, if any, not necessarily excluding the work of lectures and teaching from the more general point of view apart from the teaching of experts, not to exclude that, but to point to the fact that we should regard that as wholly and completely subordinate to the research work and consultative work, which, it seems to us, is the work which such a centre as the University College that hopes to be a university ought to carry out. We hope shortly—in fact, the list was placed before me only yesterday—to form an advisory committee, with representatives from the neighbouring counties, so as to aid us in directing our efforts in the direction which would be profitable to the neighbouring counties, for most assuredly it is not our wish in organising this incipient department in any sense to re-duplicate any of the work that is being carried out in our own neighbourhood, but rather to eventually form a consultative centre from which we hope may radiate some of the higher results of teaching, one of the functions of the Professor or the Director being that he should keep himself in touch with what is being done elsewhere, and thus correlate the work as a whole. I may only add that we hope ere very long to make appeal to the Privy Council for a charter for the University of Bristol, and in that appeal the needs of the prosecution of such work as I have very briefly sketched will be put forward and pressed. Those are the main lines of the small amount of work which has already been done and the views we have with regard to the development of that work.

5933. Your view is that the main object of university work in connection with agriculture should be research more than the training of the students, that the training of the students should be left to the colleges?—That is our feeling.

5934. And that at the university original research work of the highest form should be undertaken?—That is our conception.

5935. And that the results of such work should be correlated with the neighbouring counties. And I suppose you are also in favour of this research work being done at your College and at other colleges, and that the results should be compared?—Yes, ultimately.

5936. And you are aware of the schemes which have been submitted by the Board of Agriculture for the purpose?—Yes.

5937. You agree that guidance might be given as to the subjects which most require that research which you have described?—Yes.

5938. So that the whole country will benefit by that work?—Yes, that is quite our feeling.

5939. And the need of correlation is very strong?—Yes.

5940. (By Lord Barnard.) I have been somewhat startled with the views you put forward. I am associated with a college, at a considerable distance from Bristol, namely, Newcastle, where we take rather a different line. You are, of course, aware of the line adopted at Newcastle; it combines the two operations of research and instruction to students?—My point was not that that was not desirable elsewhere, but we feel that would be the way in which Bristol could be most helpful to its neighbourhood.

5941. That is what I thought possible. But I was going to ask you whether you would be good enough to inform us whether that is the view of the Governing Body

5932d

Professor
Lloyd Morgan
4 June, 1907.

5932a

5932b

5932c

Professor
Lloyd Morgan
4 June, 1907.

generally or your own private view?—I am expressing the views of the Faculty of Arts and Science rather than of the Governing Body. But I have been in touch with the Chairman of the Governing body, and I am going to bring this matter before them at their meeting to-morrow. I think I may say that substantially I am speaking for the Governing Body as well as for the Faculty.

5942. Will you tell us briefly what your College is at present and what it hopes to be?—Our College is a University College; that is to say, it is about in the same position that Liverpool and Birmingham were before their Charters were obtained. The body of work that has been done and the number of students we think justify our appeal for a Charter. At present there is only needed that which is very frequently needed in these cases, a sufficient amount of endowment.

5943. I suppose what you aim at eventually is to grant degrees, certificates and diplomas?—Yes.

5944. Is your College mainly a Bristol College, or do you anticipate that it should appeal to a wider circle?—It will be mainly a Bristol College, but we hope that it will affect the surrounding counties of Gloucester, Somerset and Wilts, at least. Of course, further west there is the college which is going up at Exeter; but at present that is not very strong.

5945. What the Committee are faced with is the state of affairs which is disclosed on that map, that is to say, there is an enormous space of ground which is not covered by any institution which is providing higher agricultural instruction. I was under the hopes that you would hold out a prospect of Bristol filling up that gap.

5946. (*Mr. Medd.*) May I make one remark, and that is from that map the Royal Agricultural College is excluded as not being subsidised by the department, and I imagine Prof. Lloyd Morgan is expressing the opinion that his department had in mind the work done at Cirencester. Cirencester trains students as you do in Newcastle, but it does not appear on the map, because it receives no Government grant.

5947. (*The witness.*) I might be allowed to say that we have in view the possible reconstruction of the College at Cirencester, and hope that there will be very close relations between that college and possibly other colleges with the university work.

5948. (*By Lord Barnard.*) In fact you have it in contemplation that you may be able to provide similar instruction and certificates and diplomas and so on as are provided by universities in other parts of the country?—Yes.

5949. Otherwise I was going to ask you whether you and those who act with you had any other scheme in your heads for covering that blank space on the map. You mentioned Exeter, but I don't think they do any agricultural work at Exeter. Practically, the whole of your work at present is distinctly on research lines, and it is your suggestion it should continue?—Yes, it is our suggestion it should continue, but we hope it will be a nucleus for much further development.

5950. Did you contemplate at all becoming an examining body in, say, agriculture?—In view of our becoming a university and therefore having the opportunity of granting degrees, the work of such a college as Cirencester should be closely in touch with the university and should send their students, I take it, to the university to obtain their degrees and their diplomas.

5951. You made a remark about the possibility of the importation of noxious insects, I suppose you are aware that the Board of Agriculture are passing a Bill through Parliament to enable that question to be dealt with at the present time?—We thought local touch with the matter might be helpful.

5952. (*By Dr. Somerville.*) One question I think could be put very appropriately to you as a man who is giving his attention largely to educational problems. You have, I suppose, in Bristol a department of engineering?—We have.

5953. Is that department in close contact and close touch with the engineering works in the West of England?—With the engineering works in the neighbourhood of Bristol, and to some extent further afield in Bath.

5954. Is the staff of the engineering department available for purposes for consultation by firms that are engaged industrially and commercially in engineering?—Comparatively little of that consultative work has been done in connection with that department, largely owing to the fact

that the staff is not large enough to justify any proportion of their time being devoted to that work.

5955. I suppose that one cannot say that a firm of engineers in difficulty with regard to some problem of construction would be able to come to your University College and command the time of any member of your staff with a view of getting them out of the difficulty?—I do not think that would be so with regard to the engineering. Of course our Professor of Engineering is in constant touch with them, but not from the point of view of business transactions.

5956. That is just the point. People ask why farmers should have all this done for them by State aid, whereas other industrial businesses have no such facilities placed at their disposal? What is the answer to this question? Why should farmers and agriculturists have such marked preferential treatment?—I think that is rather a difficult question to answer. But I take it, that the work of a University or University College should be as far as possible work which will aid all those who seek information. And I confess it seems to me that the two, the engineering firms who want assistance and the farmers throughout the country who want assistance, are not quite on the same footing.

5957. Still, they are both engaged in commercial enterprises; both, I suppose, have profit as their object, and why should the State, in the one case assist them to the goal of private profit, and in the other case not supply the machinery for taking them to this desirable end?—I take it, in some cases, at any rate, the County Committees will, perhaps, contribute something to the University centre with the object of giving facilities for those for whom they are catering to obtain this information. I think that is so in Birmingham.

5958. You do not think there is anything in the suggestion that in the one case an absolute necessity of life is the object of the business, and in the other case, possibly, objects of luxury are the object of the manufacturer?—I am afraid I have not formed a definite opinion.

5959. (*By Mr. Medd.*) Have you formed any idea as to the amount of money that you would require?—For the immediate future, I take it, that the appointment of a strong man as Director or Professor is required, and I don't think that a salary of less than £600 a year could be offered to such a man if he is to be a satisfactory man; and there should be some further provision for an assistant in the research work which I have indicated, so that I think something like a thousand a year is what will be required to put the department upon a satisfactory basis as a start.

5960. And, of course, you look for local contributions from the adjoining counties and, possibly, from Bristol itself?—We hope to obtain them, yes.

5961. And you, as a collegiate centre, of the highest grade, would co-operate with such counties as might be affiliated to you? I would like just to make it clear in regard to Lord Barnard's remark; of course, you feel that with the Agricultural College at Cirencester for the training of students that is a branch of the work which need not be undertaken by you at Bristol?—That was our feeling.

5962. And you hoped that the connection between Cirencester and yourself might be of the closest possible character?—I think so.

5963. That possibly the best students from Cirencester might come to you for purposes of research work, and that students of yours might possibly go to Cirencester if they desired experience in practical work?—That was our idea very largely in the last relation as well as the first.

5964. And in that way, if this scheme were carried out, you, as a centre with the affiliated counties, would make a similar provision for that area to the provision made by Leeds for the Ridings of Yorkshire?—I think so.

5965. And, of course, great importance is now attached to forestry; have you formed any idea yet of the particular directions in which you could aid forestry and establish a stronger claim on the public?—I am afraid I have not. That is a matter which is under consideration at present, but I am not able to speak upon it.

5966. Of course, we have, in Gloucestershire, very extensive woods, and the county is particularly adapted for the purpose of forestry education?—Yes; and we hope to be in touch with Mr. Napier Miles, who is interested in these matters. We wish to seek further information before proceeding in that matter.

5967. (*By Professor Middleton.*) Do you feel yourselves in a position to conduct original research at Bristol with the

Professor
Lloyd Morgan
4 June, 1907

existing staff ?—In certain lines we want further strengthening, on the zoological side, for instance, for the insect pests.

5968. We have here the name of Professor Francis: how many others work with Professor Francis at Chemistry? How many assistants has he in his laboratory?—He has two assistants.

5969. And are all three men engaged in teaching and demonstration at present?—Yes.

5970. So that none of them has his whole time free?—No.

5971. Have you any research students in the laboratory at present?—In chemistry, yes.

5972. That is to say, post-graduate work does go on?—Oh, yes. I don't quite know how many. I suppose, roughly, about five or six.

5973. How are you situated with regard to accommodation for those students for post-graduate work?—Not very satisfactorily. We want to increase the size of our laboratory. We have quite recently converted a room into a research laboratory, or a laboratory which is mostly for research: but one of our hopes is that we shall be able to build a new chemical department.

5974. Then with regard to Botany, is Mr. Priestley the lecturer?—Yes.

5975. Then you have no Professor?—No.

5976. In Mr. Priestley's department, how many are there in addition to himself?—Only one in addition to himself, and a student assistant.

5977. Then you mentioned, I think, that on the zoological side you require additions to the staff?—Yes, we require further strength. Of course, I have had a little to do with the side myself, but I do not feel that I should be strong as a specialist, and, unfortunately, we at present are obliged to have one Professor to cover both geology and zoology, so that he has no time for such work.

5978. So that it is in the chemistry and botany you are prepared to undertake research at the present time?—Yes.

5979. And also in physiology, perhaps?—Yes.

5980. How many have you in that department? Is it a strong department?—Well, no, it is not a strong department. There is the Professor of Physiology and two assistants, I think, and then his work is partly connected with the Professor of Pathology.

5981. (*By Mr. Davies.*) You mentioned the Cider Institute; is there any chance of your taking that up as an integral part of the work of the college?—I hope the closest possible touch will be kept between the work of the college and the work of the Cider Institute. At present I do not think that we should contemplate absorbing the Cider Institute, because I hope the Cider Institute is so strong that it would rather resent absorption in that way, but I hope there will always be the closest possible touch between them and the work of the other colleges.

5982. Your idea of development is to use the Agricultural College at Cirencester as a sort of appendage or affiliated college to the University?—Yes.

5983. What do they do there in the way of short courses for farmers' sons?—I am afraid I cannot answer that question with regard to what is being done at Cirencester. I am not sufficiently aware of the exact nature of their work. I believe there are changes in contemplation, but we shall watch any changes that take place with great interest.

5984. Is there any reason why you should not contemplate giving short courses in chemistry and biology and so on to some of the farmers at Bristol without enlarging your present staff? Why should you not be able to use the existing machinery in the way of giving a sort of short-time instruction?—That we hope to do. I think it is possible from what I said, it might be imagined that we were not going to attempt to do any lecturing. The position I wish to take is that we should not lay stress upon that as our first line. We hope next session to have a short course of lectures, probably from Mr. Barker, and we hope to organise other short courses, but that will not be our main line. We hope they will be helpful and sufficiently upon the lines of helping people to see what the research is doing, keeping in close connection with the research work, and not to have mere popular lectures, but rather lectures which will indicate the lines upon which research is going and the advantages which may come from such research work.

5985. (*By Lord Barnard.*) From what source do you

expect to get financial assistance from the adjoining counties? From private sources or from the County Councils?—We hope to get some assistance, if we can so far justify our existence, from the Education Committees.

5986. You are, perhaps, aware we have had a great deal of evidence from Education Committees of late—I do not know whether this would apply to the counties around Bristol—the whole of which point to the daily increasing difficulty under the altered circumstances of obtaining financial assistance for agricultural work from these bodies?—I am afraid that is so. I happen to be a member of the County Committee of Gloucester and Somerset, and I know how difficult it is for us to devote money for such purposes owing to the pressure which there is, and the many calls there are upon our finances. But still I thought that a small grant could probably be obtained from Gloucester and Somerset.

5987. And you think those County Councils would be prepared to make such grants, although you do not undertake any instruction work?—I am afraid I cannot say. I have had some little talk with the Directors of Education, and some little conversation with Mr. Hobhouse as chairman of the County Council of Somerset.

5988. I should like also to ask you—I have been thinking over what you said just now—whether the system of research without any extensive instruction of students, which you foreshadowed, is to apply to agriculture only, or whether you propose to apply that same system to other branches of the work of the college?—Not to other branches.

5989. To agriculture alone?—Yes.

5990. Would you give us any reason for that? I regret to say I fail to understand why what is considered necessary at Leeds and Cambridge should be considered unnecessary for the West of England—I thought, possibly, what Mr. Medd had said would have helped to clear the ground a little with regard to the other college at Cirencester. Speaking frankly, we are particularly anxious at Bristol not to make any move which could possibly be interpreted as antagonistic to any existing institution. We wish to work with these, and not to try and set up a department which would be regarded as in any sense a competing department with other existing colleges, especially at the present juncture with regard to Cirencester.

5991. And then you do not take quite the same view as they do in the Eastern Counties, where we have a University centre at Cambridge, and quite close you will see on the map three white spots, numbers 4, 5, and 10, representing other institutions. In that district they have four rate-aided institutions, and apparently the University work is not considered as interfering with them?—I rather feel that possibly Cambridge stands on a rather different footing than Bristol.

5992. Take my own district, the north; we have not felt in that case that having a University Institution only 40 or 50 miles off is a serious competition to the Newton Rigg school. You don't look at it in that light?—As I say, we are particularly anxious, in any move we make at the present time, not to be possibly interpreted as antagonistic to any existing institution.

5993. (*By the Chairman.*) You are at this moment still in a stage of development?—Yes.

5994. You are just applying for a charter?—Yes; we hope ere long to do so.

5995. And in order to obtain a charter, and in order to retain claims on the neighbourhood in which you are, you are very anxious not to tread on the toes of any existing institution; is that not your position?—Yes, partly that and apart from treading on anybody's toes we should not like to feel just at a time when Cirencester is making a definite move that we possibly come in with a counter project.

5996. And besides, as your means are limited your conviction is that what is more wanted than anything else in that district in which you are situated is research work?—That was our feeling.

5997. If it can do other work it ought not to neglect it?—That is so.

5998. But still in your present state of development that is the work you consider, with the means at your disposal, will give you the maximum of efficiency and usefulness in your neighbourhood?—That was our feeling.

5999. Now, with regard to the highest form of research, obviously your research has educational value, because, as you have already stated, you would have post-graduate students connected with the research department?—Yes.

- Professor Lloyd Morgan*
4 June, 1907.
6000. You would not refuse access to your research work by competent students?—Certainly not.
6001. You are quite prepared to receive them?—We hope to encourage such students.
6002. That would be the highest form of education?—Yes.
6003. Therefore all you meant to say when you said you considered that the teaching and training of agricultural students should be subordinate, you meant by that the preliminary stages?—Clearly.
6004. You do not mean you would not receive any number of students who would come to you with a view to being prepared thereafter for agricultural pursuits?—That is exactly the position.
6005. Now for that work I suppose you would admit that you would be fully justified in obtaining a grant from the Exchequer?—I hope so.

6006. You have at present a grant to the college?—We have.

6007. With regard to the justification for the intervention of the State, more especially with regard to agriculture, would you not admit that agriculture, being one of the main industries of the country, stands in a very special position?—Yes, it does.

6008. And besides that, whereas no one would attempt to set up as an engineer or open textile works of any kind without special knowledge, unfortunately as regards agriculture everyone considers himself competent to enter upon that business?—I am afraid that is so.

6009. And therefore it is desirable that some machinery should exist which would make people realise that agriculture is not different from all other forms of business, but that it also requires a certain amount of skill to enable it to be conducted with profit and with efficiency?—Yes.

6010. (*By the Chairman.*) We have been very much interested by your evidence, and we hope that the University of Bristol will be very successful in carrying on their operations.

THIRTEENTH DAY.

Wednesday, 5th June, 1907.

PRESENT.

The Right Hon. Lord REAY, G.C.S.I., G.C.I.E. (*Chairman.*)

The Lord BARNARD.

The Lord BELPER.

Lord MORETON.

Mr. NORMAN LAMONT, M.P.

Mr. THOMAS LATHAM.

Mr. J. C. MEDD.

Professor MIDDLETON, M.A., M.Sc.

Mr. A. E. BROOKE-HUNT (*Secretary*).

Mr. H. L. FRENCH (*Assistant Secretary*).

Mr. SAMUEL KIDNER, called and examined.

- Mr. S. Kidner.*
5 June, 1907.
6011. (*Chairman.*) You are a member of the County Council of Somerset?—Yes.
6012. You are a farmer?—Yes.
6013. How large is your farm?—About 300 acres.
6014. Will you give the Committee your opinion as to the kind of instruction which you think is most valuable for farmers?—After the ordinary school education, you mean?
- 6014A. Yes.—My feeling is that to an extent college-training is desirable, but at the same time a different view may be taken in our part of the country—I think chiefly from the quality of the education that has been given at our colleges—I think a certain college training is very useful to every young farmer if it is not carried to too great an extent; and I think that in the first place our young farmers should be thoroughly grounded in practical knowledge, and, if possible, it should be brought within the reach of as many young farmers as possible by having a short course at one of the colleges more in the way of giving them an interest in the work than anything they will definitely learn there. If they had, say, six months' training at one of those colleges, my experience is, and I think it would be all ours, it gives those young men an interest in that kind of work, and they read and gather knowledge and information for themselves in after life which they would not attempt if they had not had that training.
6015. You think six months is sufficient?—I do. I think it is sufficient for the young man himself, and, I think, if you limit it to six months' course you would bring it within the reach of more. I do not want to see only a few of the brighter stars picked out and the others neglected.
6016. You think it ought to be general?—Yes, as general as possible for every young man that is worth teaching.

6017. You would not give them much theory?—No, very little, indeed, just a little intelligent knowledge of the subjects, not to make them chemists, but a sufficient knowledge to enable them to understand the various things intelligently afterwards.

6018. You would then send them to college?—I should prefer a year's practical work first in between. It would be difficult, perhaps, to get them to go to a college after that, but if it could be done it would be very much better, in my opinion.

6019. Do you know the Basing School?—No.

6020. Which school are you acquainted with?—I am in a part of the country where we have not one of those institutions shewn on that map at all; we are some distance from them. We carry on our instruction more in an itinerant way at the present time.

6021. By lectures?—Yes.

6022. Are those lectures provided by the County of Somerset?—Yes.

6023. Does the County of Somerset offer any scholarships which are tenable at any of the colleges?—Yes, certain scholarships are offered which are tenable at three of the schools. There are two or three schools where they have an agricultural side to them where these boys gain scholarships.

6024. Where there is an agricultural side to the school?—Yes.

6025. You approve of that?—Yes; I think you cannot instil that knowledge into them too early to a certain extent.

6026. Do you think that an elementary school ought to

have a school garden?—They have in some cases, but I am very doubtful as to the use of it.

6027. You think the elementary school should limit itself to the teaching of elementary subjects?—Yes, I am inclined to think that is almost better.

6028. Then with regard to the teachers at the colleges, do you think it is important that they should have practical knowledge?—It is very important, but it is very difficult in these cases such as I am illustrating, but it would be a very great advantage, undoubtedly, if they had.

6029. Then you think young men fresh from college are not suited for posts as travelling teachers?—I do not; they are looked upon with a certain amount of ridicule by the practical men; and even if they have a good deal of good to teach, their general lack of practical knowledge dissipates their other teaching to a great extent.

6030. You are of opinion that the object should be to enable students to become enlightened farmers, and not chemists?—That is my view.

6031. Where colleges exist, the teaching should be general?—It should be general as much as possible, and it should not be confined to only a few scholarships.

6032. You think that the kind of instruction ought to be suitable for the sons of large as well as small farmers?—Certainly, and perhaps more particularly for small farmers, because a large farmer will always take care of himself, and if he thinks it is desirable he will send his boy somewhere to get the best instruction he can; it is the small-sized, and the medium-sized farmer that wants the most attention, probably.

6033. Are you in favour of experiments being carried out by the teachers at the colleges?—Well, there I am very doubtful; it is on too limited a scale very often to be very much good.

6034. You think men ought to be specially trained for conducting these experiments?—So far as experiments go in a small way, I rather approve of what we are doing in our county. We are carrying it to the roadside, in different parts of the county where we can get farmers to give up their land for the purpose, and we are conducting several experiments in different parts of the county, but any particular result in any year may be more or less fallacious; it wants carrying on over a number of years on a variety of soil, and under varying conditions of climate, and the more that could be co-ordinated throughout the country, the greater value it would have.

6035. So that results could be compared between different parts of the country and as between different years?—That is so.

6036. Who conducts these experiments in your county?—Our agricultural instructor, Mr. Burton.

6037. Are you in favour of having an agricultural instructor for these experiments?—Yes.

6038. Only he should be carefully and practically trained?—Yes. In fact, partly on my initiative, we are directing his energies more in the direction of carrying out these experiments and seeing that they are properly done and in taking samples for analysis. We think he is doing more good in that direction than in trying to teach practical work from his own knowledge.

6039. You think he could learn as much, probably, from the farmers as the farmers could learn from him?—Well, it has been given out that if anyone wants him on a farm, he is always at their service, but I am afraid he is very seldom applied for in that way.

6040. He has not got the full confidence of the farmers?—It may be that or it may be inertness, I am afraid to say which it is, but I think there is a good deal of the first element in it.

6041. (*By Lord Moreton.*) As you have told us, there is not so much done in your part of the world for agricultural education as happens to be done in other parts of the country?—That is so.

6042. Are your opinions founded on experience gained in the West, or are they founded on what you have observed in localities where more has been done?—I think it would be both. I am away from home a good deal, and rub shoulders with a great many people probably.

6043. You mentioned in reply to the Chairman just now that you were of opinion that it was not advisable to have school gardens. Do you think it would be advisable in those schools which are attended principally by lads who are being brought up with a view to becoming farmers that they should have a chance of getting teaching on a school farm?—If it could be properly cultivated—if part

of a moderately sized farm could be set aside and cultivated according to the very best principles and practice of agriculture, it would be very useful, undoubtedly.

6044. In other words you are in favour of practical agriculture being taught on the land, but a school garden you look upon as not perhaps coming within the regular curriculum?—That is my view of the matter; it is rather dabbling in it.

6045. A good farmer is never a good gardener, many people say?—They say not.

6046. What are the subjects that are taught in the county?—Mr. Burton is our agricultural expert. He lectures on chemistry chiefly, and the relation of chemistry to the soil, and the action it has on plant life, and he summarises the results of our experiments that we are carrying on and demonstrates them. We have also a garden expert who gives both lectures and demonstrations on gardening, and pruning, and grafting, and other things—a very good man, indeed. Then we have a poultry expert who goes round the county lecturing on poultry and the various methods of keeping them. Beyond that we have taken on the cheese school from the Bath and West of England, and that has been conducted on the same lines as it was before. We have also a butter school which is located in different parts of the county at different periods of the year, and in which instruction is given.

6047. Have you done anything in regard to veterinary science?—No, there is no veterinary science, but so far as farriery goes we have had farriery classes.

6048. Apart from farriery, you have not turned your attention at all to the teaching of veterinary science?—No, we have not.

6049. Have the farriery classes been well attended?—Yes, they have been very well attended, and they did an enormous amount of good in the county.

6050. They are well appreciated and well attended?—Yes, and, I think, we get our horses shod a great deal better than we did before we began to give those lectures.

6051. I suppose you can hardly give us an idea of the number who attended those classes?—I could not give you that. We had also competitions at our various county shows which were much appreciated. Those, were aided from our county fund.

6052. I take it you are working the farriery part of the instruction in connection with the Farriers' Company?—Yes. This year is the first time we have done that.

6053. (*By Mr. Latham.*) I was rather surprised to hear you make the remark that you thought the interest in this sort of education was very good if it did not go too far. What is the use of the interest if they do not have the education?—They will get their scientific education in after-life. It seems to me what they can learn at the college and retain through life for practical use is of comparatively small importance. We have to learn through life as we go along in the best lights of scientific knowledge, and a great many of the things we learn in our early life have to be unlearned because of the advance of scientific knowledge.

6054. The scientific side cannot be learned on the practical side?—My chief objection to it is, if you go too far on the side of scientific education you cannot go as far in numbers as you want to. A good many would go for a short course, but if they have to go for a longer period they cannot possibly afford it, and their parents in a good many cases would not be willing to let them go. I think, therefore, you would defeat your object if you tried to carry it too far. That is one reason, and I think, if you try to make chemists of them, you simply make them dabblers in it. I want to make them learners more, and as time goes on they can get their scientific knowledge by reading and observing, if they want that information.

6055. I cannot say that I agree with you. You would rather that the scientific part of agriculture should be left to the chemist and analyst rather than be given to the individual?—That is so; but they should have an elementary knowledge of it, in order to give them an intelligent interest in the teaching of science and in reading with regard to it, and in order that they may appreciate the value of it.

6056. You live in a district where dairying has been made a great deal of?—Not very much; I am not in the dairying part of Somerset.

6057. I am speaking of the West of England generally, not your particular locality?—In my county that would be so, but in West Somerset we are more on a par with Devonshire; it is more mixed farming.

Mr. S.
Kidner.

5 June, 1907.

Mr. S.
Kidner.

5 June, 1907.

6058. Has not practical and scientific instruction done a wonderful deal for the dairying interest in that district?—Undoubtedly it has. The dairy lectures have been distinctly appreciated, and have undoubtedly done a great deal of good.

6059. Do you consider, if these other lectures could be carried on in the same way, with practice and science combined, they would do a great deal of good in the district?—If you could get an absolutely sound practical man with scientific knowledge at the same time, and if we knew where to find him and how to pay him, it would undoubtedly do a great deal of good.

6060. Do you not think, with this scientific education, it is possible for a man to catch hold of a good deal of practical together with the scientific education?—Yes, but it is a very dangerous method, and they are very likely to make mistakes unless they have a thorough knowledge.

6061. That has not been so in the dairy interest?—No, that has not been so in the dairy interest, but you see there they are absolutely practical, and carry out the practical work themselves, and they also teach them the science and they demonstrate themselves.

6062. Do you agree that the Bath and West have always done a great deal for that industry?—Undoubtedly so. We have always appreciated that in our county, and I have not included that in my strictures, so far as they may be called strictures.

6063. Your shoeing lectures and so on have done a great deal of good?—Yes, simply because they are given by a practical man who can go and shoe a horse better than any of his pupils, and can tell them why he ought to be so shod.

6064. Do not you consider the Farriers' Company is composed of a great many scientific men?—Undoubtedly, and their lectures in conjunction with a practical demonstrator are undoubtedly very useful; but I daresay, if any of those men who are teaching science at the same time tried to teach their pupils to shoe a horse without being able to turn it out of hand well, they would make a muddle of the whole thing.

6065. You think the practical side must come before the scientific?—Certainly.

6066. But you have no objection to their being done together, if they are done properly?—Certainly not—if by a competent teacher.

6067. Have you any secondary schools that have agricultural sides?—Yes, and they are appreciated so far as we have these scholarships in our county, and I am inclined to think that the little teaching that is given there is always useful. Some things are taught which are of absolute definite importance, such as land surveying, and things of that kind they get taught, which in ordinary schools would be neglected.

6068. Are those scholarships which are given by your County Council restricted to practical agriculture, or is science introduced as well?—Yes, it is introduced, so much so that we send our instructor there on occasion; he is associated with it to a certain extent.

6069. You seem to say that your agricultural instructor is not exactly the sort of man you want?—I do not mean to say he is not quite as good as the rest of his class, but the question is whether any of these men who have never been practical farmers themselves, and have not made a success as farmers, will ever lecture successfully to young farmers on the practical side of agriculture.

6070. Is what you term the ridicule of the farmers caused by the fact that the instructor is largely inclined to teach practical agriculture, or is it that he is inclined to teach scientific agriculture?—My feeling is that if a man is not thoroughly versed in the practical part he had better leave that part alone altogether.

6071. He cannot do the two?—I do not say it is impossible, but I cannot pitch on the man who would be available as often as we should like him.

6072. If you could pitch on the man, what then?—We should welcome him.

6073. You are perfectly aware that in many ways scientific research is of great benefit to agriculture?—Yes.

6074. A benefit which undoubtedly must come from the scientific side?—Yes.

6075. These large farmers that you spoke of, who you say take care of themselves and their sons, do they make any great effort to see that their sons are taught the scientific side of agriculture?—I think so.

6076. The agriculturist at the present day, the large man as you call him, does feel that science is essential to good farming?—Yes. I can tell you of cases in my own district where parents have sent their sons away to these colleges where they are intended for farmers ultimately.

6077. Can you tell us what happens when they come back?—I have not had that experience yet, because they are still there. I know several of them that have gone, and I could tell you better after they come back.

6078. With regard to the small farmer, it is impossible for him, possibly because he has not the means, and possibly because he has not the intelligence, to get his sons instructed in science at all. Are you against those young men getting short courses at colleges?—No, those are just the men I want. On two different occasions I have instituted lectures by our experts at Milverton, my village, and there has been a very good attendance, but mostly of the older men, and I have asked one: "Where is your nephew; he ought to be here; it is no good you learning this at your time of life"; and to another I have said: "Where is your son; why is he not here?" and so on. There was generally an entire absence of the younger men at these lectures, but I think if you could once send them away to a college, so that they might gain an intelligent interest in work of the sort, if there was a lecture of that kind given they would be among the first to attend.

6079. In the epitome of your evidence you say: "College teaching has erred by giving too much theory and laboratory work. The object should be to enable the students to become enlightened farmers, not chemists." What do you mean by that?—I mean if you send them to a college like Cirencester, where the last year, I am told, is almost entirely devoted to the laboratory in order to enable them to pass their examinations, you simply make them dabbles in chemistry all their lives instead of practical farmers.

6080. You do not think that could be altered by raising the college?—I think by altering the status of it? I do not quite know what you mean by raising it. Perhaps if you told a chemist that you wanted to go into the more practical side, he would say you were retrograding.

6081. Is there any objection that a farmer should know anything of chemistry?—No, certainly not, but I think there might be in some minds, if you placed the first importance on that, and I know perfectly well that the most successful farmer is the man who gives his greatest intelligence to the cultivation of the soil, knows exactly when to till his land, when to put in his crop, and what crop to put in. He cannot do that by chemistry, but he may be aided a very great deal by chemistry if he knows what manures to use for a particular soil and so on. He probably by his own hard experience has learned that, but if he can be aided intelligently to know why he uses such manures, and why he grows such crops, it would be useful to him, but I do not want that to supersede his practical knowledge.

6082. With regard to his practical knowledge, I dare say you are aware that there is a vast deal of money thrown away by the abuse, rather than the use, of artificial manures?—Undoubtedly.

6083. Would not it be better that a young man should have some scientific knowledge so that that should not happen?—Undoubtedly. I can give you an instance in that respect of the use of lime. Some years ago I took an off farm. I had been fully experimenting with lime on my farm, but it did no good, and I said it might do good here, and I will just lime a spot, and I put one lime dressing down; but I was never able to see any result whatever. A year or two after, my neighbour on an adjoining farm took it into his head that his farm wanted liming. He limed the whole of his arable land. I tried to get him to leave a spot so that he could compare the result and see whether it did any good or not, but I could not get him to do it. He was very obstinate. No amount of teaching would teach that kind of man, you know.

6084. You know very well of late years the Royal Agricultural Society have had an educational exhibit at their shows, showing specimens of soils that had become tainted, and exposing the mistakes farmers were likely to make, and also the mistakes that had been made by using artificial manures that ought not have been used. Do not you think that is a very useful work?—Yes, that is very useful indeed, and is just the sort of thing I want young farmers to learn and study themselves in the light of advanced knowledge as time goes on.

6085. If lectures could be given on those specific lines, would not they be of great educational value in the farmers' interest?—They would if you could get them to attend,

but my difficulty has been to get the young farmers to come. If by an easy course he could gain a scholarship, he would go to the college, because he would not be throwing away so much money. You want some particular inducement of that kind to make him begin

6086. We have had it stated in this room by a very practical man indeed, that if the individual will not go to the college, the instruction ought to be brought to the individual. What you say to that?—Well, that is better; but as I say, even if you bring it to them you cannot get them to attend. They might be flogged and made to attend these lectures, but I think if they had a scholarship which they had earned in the way I suggest they would take advantage of it; and once you give them a start in it I think there would not be the same difficulty in getting them to come afterwards.

6087. You have seen in this exhibition shed at the shows which I spoke to you about, how very seriously the soil has been affected by too much artificial manure and too much manuring of a wrong description?—Yes.

6088. Do you think that is the sort of thing which might be profitably shown to farmers?—Undoubtedly. Of course we are told now that lime used to excess, although very useful up to a certain extent, brings dry rot in roots. In my particular farm, before my father came there 60 years ago it used to be limed every year and I have never seen lime do any good on it from that time to this, and when I was a boy I know I used to have to haul out great lots of swedes that had got dry rot; but now it has been dropped we never get one.

6089. If you look at that map, you will agree there is very little educational work given in your part of the world except by the Bath and West.—No, I cannot quite agree to that, because we do a great deal of work through our County Council. We have an agricultural expert and a fruit expert who goes about lecturing. We have a poultry expert who goes about lecturing. We are carrying on a cheese school and we are carrying on a butter and a farriery school.

6090. That is practical teaching; I am speaking of scientific teaching.—Practical and scientific.

6091. Do not you live in a district where the land is very good and the use of artificial manures is not of the same value as in other districts?—It is very good, but it does very little without artificial manures.

6092. Using, as your district does, a large quantity of artificial manures, do not you think it is necessary that they should have the scientific knowledge to know how to apply them?—Yes.

6093. How can they find that out unless they have scientific instruction?—I do not think there is very much difficulty of that kind. We get papers and demonstrations published by Dr. Voelcker and by Dr. Bernard Dyer, and our Royal "Journal." There are plenty of sources from which they can gather it if they want to.

6094. Yet, at the same time, you go to the agricultural show and you see the results of land that has been injured by the application of wrong manures, and yet you would not give the young men instruction which would enable them to prevent that?—Undoubtedly, that is so; but, as you know, all the scientific teaching is more to set people on their guard than anything else. You can never know how it will turn out until you experiment. My idea is only to teach them sufficient to know how and what to experiment with themselves.

6095. You know that almost in a small field the same manure is not beneficial in different parts of it?—That is so.

6096. Is not that important from an educational point of view, and should not they be taught that?—Yes, but you know as well as I do, for instance, if you take basic slag, that no scientific man can tell you where it will act, and where it will not; he can tell you where it will probably act. A young farmer should put on one bag, say, the first year, and if it brings good results he can go ahead and experiment further.

6097. I suppose, taking agriculture, it is doubtful whether you can get general knowledge absolutely certain?—I am certain you cannot.

6098. The agricultural industry in that respect is very different from any other profession?—Yes.

6099. You can help it on?—Yes; you can say what will probably be right, but it would be very dangerous to say that the results will be absolutely right.

6100. Do you know there is a large farm attached to Cirencester?—Yes. I am told the pupil at Cirencester

spends nearly the whole of his last year's course in the laboratory in order to pass his examination. I was told that only the other day by somebody who had been there. You do not want to make them dabbles in chemistry.

6101. Do not you know that an agriculturist can get good practical knowledge by seeing what is going on on the farm there?—Undoubtedly he can, but in a case of that sort, I think, one part of the farm should be set apart from the experimental part of the farm, and that there should be somebody to farm that part according to absolutely the best principles on which agriculture should be carried out in general practice.

6102. From your remarks you would almost lead this Committee to feel that the farmer in charge of that farm is not a practical farmer?—No, not at all. It was more given me on the ground that to pass their examination necessary to gain a diploma they had to devote so much time to chemistry that they could not carry on very much practical work.

6103. Have you ever been an examiner at Cirencester?—No.

6104. You have never been there?—No, I have never been to the college.

6105. What you know about Cirencester is merely hearsay evidence?—That is so. I have seen a good many who have come from there.

6106. You have never seen any who have come from there turn out really good agriculturists?—No, I never have.

6107. I daresay you feel that plant life is a very necessary thing to us as agriculturists?—Yes.

6108. And that there is a very great deal that can be done by science to teach us in that respect?—Undoubtedly.

6109. Is not that a good thing again for agriculture? Is that to be learned by the ordinary farmer without scientific teaching?—With regard to the manuring of plants, and so on?

6110. Yes.—There again we know what manure certain plants want, and what they do not want, but we do not know *how much* they want without experimenting.

6111. Experiments mean science again?—Yes, until you have arrived at exact results.

6112. Now with regard to the taints that are given to dairy produce in certain feeding grounds of the country, do not you think agricultural science has done a good deal there?—Yes.

6113. Certain men have lost almost all their cheeses in some years because they have had an extraordinary taint in their dairy. I do not think the ordinary practical man would find out the cause of that himself?—No, that is where the scientific man could take charge of it and then when they have gathered those results, I want the practical man to learn from them. I do not want the practical farmer to become a dabbler in chemistry.

6114. I know you are a very busy man outside your agricultural occupation, but supposing you had not been such a busy man, do not you think you would have found time, if you had had the scientific knowledge in research, to make these experiments for yourself?—I do not know what I might have done in other circumstances.

6115. I think, from your evidence, you consider that science does a great deal for agriculture if it is not pushed beyond the practical side?—That is so.

6116. (*By Lord Moreton.*) Can you tell us what agricultural colleges you have had any practical experience of?—Not of any.

6117. You have not been over any?—I went over Wye College last year when I was down at the Show.

6118. (*By Lord Belper.*) I understand from what you have said that from your experience of colleges the teaching is not of a practical nature?—That is so.

6119. Although you approve of a six months' course which is probably sufficient in many cases for the ordinary student, do you think that anybody who wanted to qualify himself for the higher positions such as a teacher in a college where they give higher instruction in agriculture, could learn all that was wanted to be learnt in six months?—Certainly not.

6120. A much longer course would be necessary?—Undoubtedly.

6121. I wanted to make that clear?—Undoubtedly, that would be so.

6122. (*By Mr. Medd.*) Are you a member of the Somerset Agricultural Instruction Committee?—I am.

Mr. S.
Kidner.

5 June, 1907.

Mr. S.
Kidner.

5 June, 1907.

6123. I see you spend as much as £2,656 a year on agricultural instruction?—Yes.

6124. I gather from your evidence that you think that might be more wisely expended if your efforts were a little more concentrated on practical work and less on lectures?—No, I do not know that I can say so much as that, because a great deal of it is practical. We are not going to the extreme in the teaching of science. I am bound to say, if you ask me whether Mr. Burton can teach practical knowledge to advantage, that I do not think he can, but he can lecture to it scientifically. Then we have our poultry expert; he is practical and he can demonstrate, and, as I say, there is our fruit instructor, who gives demonstrations and shows them how to graft and prune, and so on, and we have the village gardens which he superintends.

6125. You used to have an experimental station, did you not?—We did.

6126. Why did you give that up?—In the first place it may perhaps have been useful under other conditions, but, as you know, county councils are not all composed of practical men, and on county councils, as in other cases, you find a great many men who, although they know a little about it, think they can teach agriculturists everything. I am afraid that was something of the case in the selection of this farm. It was selected in an altogether unsuitable spot to be of any use to the County of Somerset. The farm was unsuitable even if we wanted an experimental farm.

6127. You now carry on your experiments on a number of different farms?—Yes, that was carried out on my suggestion.

6128. You refer more in your evidence to instruction for the sons of small or medium-sized farmers?—That is so.

6129. You want instruction different in type from that provided at Cirencester and the advanced colleges?—That is so—a little more general and elementary.

6130. And more practical?—Yes.

6131. Have you seen any institution in England or abroad where such instruction is given?—No, I have not.

6132. You indicate the type of school which is most popular and useful in Ireland and in Holland. You want one for the small farmers who can go there for six months?—Yes.

6133. At what age would you suggest they should go?—My feeling is if they left school at the age of 15 or 16, which those boys would, I should like to see them have a year on their father's farm, or on somebody else's farm, and then go and, if possible, get a little rubbing up in scientific knowledge.

6134. You feel that that grade of agricultural instruction is neglected in England?—I am afraid it is.

6135. It is one of the most essential things for the purpose you have indicated, and you would like the Board of Agriculture to recommend proper provision for that grade?—I should say so.

6136. In fact, you think if permanent institutions where practical instruction for six months could be provided were instituted it would be welcomed by these small farmers?—I do. I think there might be a certain amount of

criticism in the first place—I should not like to say it would be received with open arms in the first instance—but so far as my enlightenment goes it would be justified and welcomed after a while.

6137. What really would be useful could only be determined by experience?—That is so.

6138. Do you not think that Somerset might, in co-operation with one or two adjoining counties, establish and maintain an institution of that grade?—It has always been my feeling that such an institution would be desirable.

6139. In regard to the agricultural sides of secondary schools, I think as a matter of fact you have none in Somerset now. The expression agricultural side is technical. You gave it up at Wellington, did you not?—I do not know—have we given it up? I am not absolutely certain now. I think there are two or three pupils there now, and they still have a school garden there, I fancy.

6140. You have three excellent schools where the instruction is all directed to rural objects—Shepton Mallet and Blackford, and there is a third I forget the name of now?—Yes.

6141. Have you visited any of these schools?—I have not.

6142. I had the privilege of distributing the prizes at the Blackford School last autumn, and it is a most excellent one. That is a school where the whole instruction is directed towards rural objects and studies, but with no agricultural side—no teaching of farming?—No.

6143. You agree that the art of farming cannot be taught at a secondary school?—I agree undoubtedly.

6144. You send some of your scholars to Reading?—Yes.

6145. Have you been able to judge of the effect of the instruction that they receive there?—No, I do not think it has been done long enough; but if any pupil who has gained a scholarship wants to go to another place, so far as we are able, we let him.

6146. (*By Lord Barnard.*) From what I have heard you say I gather that your criticism against higher agricultural instruction is limited to men who are going to undertake practical farming, and does not extend to such instruction of a higher character as may be necessary for agricultural chemists and analysts and teachers of agricultural science?—I am only speaking of future agriculturists.

6147. You would not say it was unnecessary for many other allied professions, such as manure merchants and seed merchants, and perhaps hop growers?—No. If a man is going to carry on one of those professions it is absolutely necessary that he should have all the technical knowledge, and be able to take a diploma in it, of course.

6148. That applies to land agents and surveyors and a great many other professions?—Yes.

6149. (*By the Chairman.*) I understand you to say that you think there are three schools with an agricultural side in your county?—Yes, where agricultural training is carried on.

6150. Were those the schools that Mr. Medd alluded to?—Yes.

6151. I just wanted to make that clear.—Quite so.

Mr. EDWARD BROWN, F.L.S., called and examined.

Mr. E. Brown

6152. (*By the Chairman.*) You are Assistant Director of the Agricultural Department and Lecturer in Aviculture at the University College, Reading?—Yes.

6153. You are also Secretary of the National Poultry Organisation Society, and Honorary Secretary of the National Poultry Conferences, 1899 and 1907?—Yes.

6154. Perhaps you will give the Committee some information with regard to the history and development of poultry instruction in Britain?—I have prepared a statement here which I suppose I had better read and submit to you?

6155a 6155. If you please:—Prior to 1891 no attempt had been made for the giving of systematic instruction in poultry keeping, either at agricultural colleges or in the rural districts. A few farmers' clubs and poultry societies had arranged lectures, generally, however, at rare intervals and dealing with the subject broadly. Two courses of lectures were given in connection with South Kensington at

in the early eighties, but they were in London; and did not awaken much interest. I gave three courses in 1889, 1890 and 1891 at the Munster Dairy Institute, Cork—the first, I believe, at a recognised agricultural institution.

In 1891 what is known as the "whisky money" was allotted to County Councils by Parliament, affording an opportunity of taking instruction to the people. In February, 1892, I became Lecturer in Poultry-keeping to the Northumberland County Council, the first county to take up systematic teaching on this subject. Shortly afterwards I gave similar series in Kent and Hampshire. From 1892 to 1900 my time was largely devoted to lecturing in different parts of the country, inclusive of the following 17 counties: England—Berks, Bucks, Cumberland, Essex, Hants, Hunts, Isle of Ely, Kent, Lancashire, Lincoln, Middlesex, Northumberland, Worcester and Yorks; Scotland—Berwickshire, Lanark and Roxburgh. In addition to Reading named below, I also lectured at the Edinburgh University, Eastern Counties Dairy Institute at

Ipswich, and Uckfield College, and during the period named I delivered nearly 1,400 lectures. Other lecturers took up the work, and by 1900 most of the English counties had permanent or partial instructors in poultry-keeping.

6155c From the first it was evident that peripatetic lectures, whilst necessary and most important in order to reach the great majority of farmers and cottagers, but which did not include practical training, would require to be supplemented by advanced teaching. As a rule the courses comprised two to five lectures. In 1893 a commencement was made by the holding of a three weeks' practical and theoretical course, the first in this country, at Whittlesea, in the Isle of Ely, which was followed by similar classes of from one to three weeks in Kent, Hants, and Lincoln, and a course for dairy teachers arranged by the Board of Agriculture at the Leeds College. In addition, demonstrations were introduced as a feature of village lecture courses, and in some cases practical classes for teaching the dressing and trussing of poultry.

6155d *University College, Reading.*—One of the great difficulties presenting itself to County Councils was the securing of duly qualified lecturers and instructors, knowing something of agricultural conditions, having a general and practical acquaintance with the various branches of aviculture, and capable of imparting their knowledge. To that end it became pressing important that provision should be made for fuller courses of instruction, designed with the object of meeting the requirements of teachers and of managers of poultry establishments on a larger scale than had been common up to that period, but which were already making their way. At the suggestion of Mr. A. E. Brooke-Hunt, of the Board of Agriculture, I became connected in 1894 with what was then the University Extension College, Reading, where an agricultural department had recently been formed. In November of that year this work was inaugurated by a special course of 15 lectures, and in the spring term of 1895 a short course was provided for in-college agricultural students.

6155e In September, 1896 was commenced the series of short courses which have been continued up to the present time, and of which 25 have been held. At first these occupied three weeks, afterwards increased to four weeks, and in 1900 further extended to five weeks, at which they remain. But as demand is now for longer training these are giving way to courses of 10 weeks, with an additional period of practical training.

6155f In connection with these courses, in addition to giving the lectures, I took upon myself personally the entire responsibility of providing assistance, houses, appliances, birds, etc., my remuneration being derived from the fees paid, less a percentage, for which the College provided accommodation, printing, etc. This arrangement continued with modifications until 1903, such modifications being due to the extension of the courses in 1900, when part of the lectures were given by other members of the staff, and consequently I received a smaller proportion of the fees.

6155g During the session 1899-1900 arrangements were made for in-college lectures to agricultural students, and have been continued up to the present time. In 1901 the terminal courses were commenced, extending over 10 weeks, of which eight have been held.

6155h Instruction in poultry keeping is now given regularly at many other Agricultural colleges and dairy institutes, varying, however, considerably in their stages of development. Among these may be specially named: Royal Agricultural College, Cirencester; South Eastern Agricultural College, Wye; The Agricultural College at Uckfield, Sussex; Eastern Counties Dairy Institute, Ipswich; Midland Agricultural College, Kingston; Bedfordshire County Farm School, Ridgmont; Harper-Adams Agricultural College, Newport, Salop; Agricultural College, Holmes Chapel; Lancashire County Farm, Hutton; Agricultural Department, Leeds University; University College of Wales, Aberystwyth; East of Scotland Agricultural College, Edinburgh; West of Scotland Agricultural College, Glasgow, etc.

6155i *College Poultry Farm, Theale.*—Whilst the avicultural teaching embraced a measure of practical training, as this was given at the Reading College it was necessarily limited, and the need for some farm where students could be prepared for the theoretical instruction, or be able to apply the knowledge gained, early became manifest. In 1897 I contributed an article to the *Journal of the Royal Agricultural Society*, describing the French Poultry School at Gambais (Seine et Oise), which I had previously visited, the first complete training centre for poultry, and advocated the founding of a similar school and

farm in this country. As there appeared no probability of the College establishing such a farm, and recognising the urgent need, I, in conjunction with my sons, commenced the College Poultry Farm, Theale, in the summer of 1898, the arrangement being that the College would send poultry students there for practical training, paying for the tuition the fees received less an agreed percentage. We undertook the financial responsibility of the farm, and until 1903 provided the entire equipment. During and since that year the College has made some of the extensions required, partly, however, for the experimental work. When the terminal course was begun in 1900 it was arranged that students should spend half their time on the farm in practical work, which arrangement has been since extended to the five weeks courses, for which *pro rata* payments are made. No payments for maintenance of the farm have been received or grants from public funds, and no student has been received except through the College.

As the farm has been run entirely as an educational establishment, the commercial possibilities have been made secondary. The result is a nett loss to September 30th, 1906, of £176 17s. No salaries for my sons or myself or interest on capital are included in these figures. In 1902-3, when a salary of £100 was granted to me apart from fees, this was devoted to payment for their services, and on the rearrangement in 1904 the amount paid then and since to me as salary has been inclusive of the work of my son or sons. So economically has the farm been conducted, due to special circumstances, that had it been worked as a branch of the College the cost of management would have entailed an additional expenditure of at least £1,500. Interest on capital would have amounted at four per cent. to £180. Thus we have devoted to education in poultry keeping, inclusive of the loss on the farm, not less a sum than £1,850.

The College Poultry Farm, Theale, consists of 7 acres devoted entirely to poultry, except that it is cropped or fed off by stock to sweeten the land, and in addition we run our birds on meadows adjoining of nearly 30 acres. The following is the equipment:

- (a) 14 permanent scratching shed houses and runs.
- (b) 14 portable houses.
- (c) 3 permanent houses for growing chickens.
- (d) 4 duck houses and runs.
- (e) House for sitting hens.
- (f) Incubator house (36ft. by 14 ft.) holding incubators for 2,000 eggs.
- (g) Plucking and trussing house (used also as lecture room).
- (h) Fattening shed.
- (i) Winter brooder house.
- (j) Carpenter's shop.
- (k) Food stores, etc.
- (l) Incubators, brooders, coops, and the usual appliances.

We usually maintain a stock of 200 breeders, and in 1906-7 hatched about 5,000 chickens and ducklings, and killed 1,500 birds. The main idea in view is to provide practical work for students.

Nature of Instruction.—The object in view has been to combine practical training with theoretical instruction. To that end the courses arranged vary in accordance with the requirements of students.

I. Short course, extending over five weeks, including Lectures at the college, and Practical Work on the College Poultry Farm, which latter can be extended. The lectures in this course include (1) Aviculture, (2) Soils, Meadows and Pastures, (3) Chemistry of Foods, and (4) Anatomy and Physiology of the Fowl, the first of which are given by myself or Mr. Will Brown, and the others by different members of the college staff.

II. Terminal course, extending over ten weeks, inclusive of Lectures and Practical Work. The lectures in this case are on the same plan as mentioned under I., with the addition of Book-keeping, but are much fuller.

III. Certificate in Aviculture, extending over 12 months, and granted to a student of the college who has:

- (a) obtained the College Diploma in Agriculture, or (2) Certificate in Agriculture, or (3) Diploma or Certificate in Dairying;

Mr. E. Brown.

5 June, 1907.

Mr. E. Brown.
5 June, 1907.

- (b) attended the full course of instruction in Agriculture held during the spring term and passed the examination held at the end of that course ;
- (c) attended three months at a poultry farm or establishment approved by the Joint Committee ; and
- (d) passed a practical examination held at the close of this period.

Agricultural Certificates granted by recognised colleges other than University College, Reading, are accepted under certain conditions.

Students engaged wholly in Practical Work devote their entire time to the various operations on the farm, inclusive of building and erection of houses, brooders and coops, etc., planning of ground, etc. Subjoined is the daily time table of Course Students :

7-8 a.m.—Feeding and cramming.

10 a.m.—Incubators.

11 a.m.—Lecture (at the college).

2-5 p.m.—Practical Work (including attention to houses and stock, incubators and sitting hens, chickens and ducklings in coops, brooders, etc., mixing and preparing foods, feeding, cramming, killing, plucking and trussing, carpentry, experimental work, surveying of land and in quantities, judging fowls, etc.)

Students are occasionally trained in selection and judging of fowls ; debates take place regularly ; and excursions are made to other farms.

6155k *Special Poultry Students.*—The following table shows the number of students who have taken Poultry Courses at Reading College and the College Poultry Farm, Theale, apart from the regular in-college agricultural students :

Session.	Attending Courses.	Pupils on Farm.	Totals.
1896-7	26	—	26
1897-8	22	—	22
1898-9	31	—	31
1899-0	32	14	46
1900-1	42	11	53
1901-2	56	5	61
1902-3	72	8	80
1903-4	59	5	64
1904-5	42	18	60
1905-6	30	8	38
1906-7	23	13	36
Totals	435	82	517

6156. The 435 include all three courses that you have referred to ?—Yes.

6157. What do you call the pupils on farm ?—Those are the pupils who come purely for practical work and do not take a theoretical course.

6158. Not even a five weeks' course ?—No ; they take no theoretical instruction at all.

6159. They come for a casual visit, you may say ?—No ; in some cases they come for three months, and in others they have taken theoretical courses at other colleges, or perhaps in a few cases they are people who have been poultry keepers for years, and other students of that kind that come for definite work.

6160. You do not consider them in-college students ?—No.

6161. They are outsiders ?—Yes, they are outside students, although all the arrangements are made by the College.

6161a Students have been received from all parts of the United Kingdom. In addition, we have had students from France, Holland, Germany, Sweden, and Russia, on the Continent of Europe ; from Canada and the United States in America ; from Natal, the Transvaal and Rhodesia in South Africa ; from New Zealand and from Ceylon. During the earlier years the majority of students came for the courses alone, but the tendency has been for these to be supplemented by practical work on the College Poultry Farm, so that the period of instruction has steadily increased. The following table gives the records for the 12 months ending March 31st, 1907 :

SHORT COURSE (five weeks) STUDENTS

No. of students 15.

7 took Course only.

1	2 weeks' practical work additional
2	4 " " " "
2	6 " " " "
1	13 " " and Terminal Course
1	13 " " " "
1	21 " " " "

—

15 Average duration of Instruction, 11.6 weeks.

6162. When you say " courses alone," does that mean purely theoretical knowledge ?—Half the day in lectures and the other half in practical work on the farm ; but that means that they were only there for five weeks.

6163. You say the tendency has been for those to be supplemented by practical work on the College Poultry Farm. Does that mean that the tendency has been to give them more practical work ?—Yes, distinctly so.

6164. In every case practical work is included in the course ?—Quite so.

Then for the Terminal Course we had eight students last year, of whom

4 took course only.

1	short course and 13 weeks' Practical Work additional
1	17 weeks' Practical Work additional
2	26 " " " "
—	
8	

Average duration of Instruction, 18.62 weeks.

PRACTICAL WORK Only.

No. of students 13.

1 took 3 weeks' instruction.

5	4 " " "
1	5 " " "
1	7 " " "
1	10 " " "
4*	13 " " "

—

13 Average duration of Instruction, 7.46 weeks.

I may say, at this point, that sometimes a county council will send their instructor or instructors for a month for special training in dressing or trussing or something they are going to lecture upon.

Total number of students, 36.

General average duration of instruction, 11.6 weeks.

Total instruction in courses, 185 weeks.

Total instruction in practical work, 233 weeks.

Grand total for year, 418 weeks.

Of the above students eight have remained for other courses at the College.

Records of students.—Of students who have taken Poultry Courses at Reading and Theale the following records are available :—

Poultry Lecturer at Royal Agricultural College.
Poultry Lecturer at S.E. Agricultural College, Wye.
Poultry Lecturer at University of Wales, Aberystwyth.
Poultry Lecturer at University of Wales, Bangor.
Poultry Instructor, Harper-Adams College.
Poultry Lecturers to 16 British County Education Committees.

Nearly all the Irish Poultry Instructresses were trained at Reading.

Five are engaged as Poultry Teachers to Scottish Agricultural Colleges.

Poultry Instructor to Ontario Department of Agriculture, Canada.

Poultry Expert to Transvaal Department of Agriculture.

Poultry Instructor, Government Agricultural School, Cape Town, South Africa.

Nearly 60 are engaged as owners or managers of poultry farms.

Two have large businesses as manufacturers of poultry appliances.

Experimental and research work.—The essential need for experimental work in respect to aviculture has been apparent for many years. This was one of the objects we had in view when establishing the College Poultry Farm. The records given below are small as compared with what

6164a

has been achieved in America, where money has been freely expended, in this direction. It has, however, been a question of cost, as research work is expensive both for equipment and time occupied. Our experiments have been conducted without any grant or payment, except that the College has printed the reports. Were the funds available much more might be done, to the great benefit of the poultry industry. Some of those carried out have involved an enormous amount of labour.

6165. It is in the direction of research that you would like to dispose of more funds?—Distinctly so.

6165a The following notes will show the extent of observations made :—

- (a) The College Poultry Farm, Theale, was the pioneer in this country of the scratching shed system of housing, now so largely adopted ;
- (b) We were the first in this country to introduce the larger brooder house system for artificial rearing of chickens ;
- (c) The Incubator House at Theale has been a model as to general arrangement and system of ventilation, which are adopted to a large extent. Its success in results has been very great (*vide* reports) ;
- (d) The six open-fronted houses erected at Theale two years ago have contributed to the solution of the problem of housing, and have been largely copied. They were among the first of the kind in this country ;
- (e) At Theale the system of dry feeding of chickens was carefully tested for three years (1900-2). The results published have led to the general adoption of this method in connection with artificial rearing, which has solved what appeared to be the chief difficulty, and has enormously increased the production of chickens.

The actual experiments made at the College Poultry Farm, Theale, are :—

- (1) 1900-2.—Dry feeding of chickens, as above.
- (2) 1903-4.—Artificial incubation ("Journal of the Board of Agriculture," June, 1904).
- (3) 1904.—Growth of chickens and cost of rearing (Report, July, 1904).
- (4) 1904.—Cost of growing pullets to a laying age (Report, September, 1904).
- (5) 1904-5.—Artificial incubation ("Journal of the Board of Agriculture," May, 1905).
- (6) 1905.—Growth of chickens and cost of rearing ("Journal of the Board of Agriculture," August, 1905).
- (7) 1906.—The rearing and feeding of turkeys (Report, January, 1906).
- (8) 1906.—Artificial incubation ("Journal of the Board of Agriculture," July, 1906).
- (9) 1906-7.—Poultry manure ("Journal of the Board of Agriculture," March, 1907).

I should like to put in as evidence copies of the various reports. (*Handing in documents.*)

At the present time five series of experiments are in progress on the College Poultry Farm, Theale, and much more is required in that direction were the equipment and staff available for the work.

6165b *Poultry instruction abroad.*—As already mentioned, the first poultry school was at Gambais, France, followed by Reading in 1894, and by the Rhode Island Agricultural College in 1896. In America great developments have taken place, but more especially in connection with agricultural colleges, of which nearly 30 have special poultry departments. In Australia, New Zealand and South Africa similar institutions are now in operation. I am personally acquainted with the following :—

Gambais (Seine et Oise), France, entirely devoted to Poultry, maintained by the French Government.

Godollo, Hungary, entirely devoted to poultry, maintained by the Hungarian Government.

Kingston, Rhode Island, U.S.A.

Storrs, Conn., U.S.A.

Cornell, New York, U.S.A.

Guelph, Canada.

The last four, which I visited in 1906, are in association with the agricultural colleges maintained by the various States at the places named, but whilst under the general control of the respective Boards of Management, have separate staff, and receive grants or appropriations. They partake of a special character, but also give poultry instruction to the ordinary agricultural students.

Barcelona, entirely devoted to poultry, maintained partly by the Spanish Government. I have not visited it, but my son did so in 1904. *Mr. E. Brown.*
5 June, 1907.

With respect to these various teaching establishments :—

Gambais (France) is well equipped, but limited in extent and largely confines its operations to breeding, hatching and rearing.

Godollo (Hungary), at the time of my visit in 1904, was on a small scale with a modest equipment.

The Canadian and United States Colleges named above specialise in some directions, but generally speaking are incompletely equipped. I was unable to visit the Maine Farm at Orono, where very fine ranges of houses have been erected. It is anticipated that the poultry section of the new Macdonald Agricultural College, at St. Anne de Bellevue, Quebec, which I also visited, will, when opened be one of the best in America. As at most of these, but not at Kingston, Rhode Island, the teaching and experimental staff are the same. I am not in a position to give any particulars as to cost of maintenance so far as educational work is concerned.

Two points may be submitted to the Committee for their consideration ;

- (1) At Gambais, Godollo, and at all the Colleges which I 6165c visited in America, no charge is made for tuition to students from the countries or states in which they are situated. As a consequence the number of students is only limited by the accommodation available. Whereas we are compelled to charge fees ranging from 15s. to 20s. per week according to the length of the Course. Such fact should be kept in view if comparisons are made of numbers attending American and English Poultry Courses. For non-State students our fees are rather the lesser.

- (2) Provision is made in America whereby 6165d students are able to obtain employment in order to pay for board and lodging, such employment being in or out of the College as the case may be. Students are willing to do anything, and do not suffer in status among their fellows. Female students are often employed by the Colleges as typists, book-keepers, and even house servants, and men as teamsters, lawn cutters, accountants, etc. Such a system affords an opportunity to many who would otherwise be debarred.

6166. Do you think that could be organised here?—I wish it could. Our great difficulty is the feeling on the part of the students, but it is one of the most striking things that I found in America, and I could give the Committee many examples that I came across in that country, because it interested me very much.

Experimental work in America.—Whilst in many respects 6166a both as to equipment of plants and the actual instruction given to poultry students at colleges in America these are capable of considerable improvement, the fullest praise can be accorded to the spirit with which experimental work is conducted. We may criticise some of the results achieved, but not the way in which research is undertaken. The federal authorities at Washington and the respective State Departments of Agriculture recognise to the fullest extent the importance of this work, and encourage it in every way possible. It is largely a question of money. In 1905 the following appropriations were made for Agricultural Experiment Stations :—

By the U.S. Department of Agriculture ..	£149,600
By the State Departments of Agriculture	£112,500
	£262,100

Nearly all the principal colleges until 1906 received £3,000 per annum each from the federal authorities for experimental work in Agriculture, but at the beginning of the present year some have had the amount increased to £6,000. Rhode Island and several others are receiving £6,000 per annum for experimental work.

6167. That £262,000 does not include what is spent for experiments in the colleges?—That is for the experimental work of the colleges.

6168. That £262,000?—Yes ; that is for the experimental work.

6169. Conducted at the colleges?—Yes ; or at special institutions.

6170. It has an educational value also?—Yes ; it is used educationally, of course.

6171. I thought the experimental stations were separate

from the college?—No; so far as I am aware, there are only two separate.

6171a In addition, in certain cases experts are sent from Washington for special research. For instance, for three years Dr. Curtice, a skilled pathologist, has been engaged in an enquiry as to what is called Blackhead (*entero hepatitis*) in turkeys, a disease which is devastating the Eastern States. The grants named are additional to those received for teaching. At Storrs College, Conn., which has had half the grant to the State (£1,500) of that amount, £200 was devoted last year to poultry experiments, which appears to be a fair proportion, though it is evidently exceeded at some stations.

Mr. E. Brown.
5 June, 1907.

It would be impossible, except at great length, to give a list of poultry experiments conducted at the various American Stations, but at Cornell, Ithaca, N.Y., when I visited the college in July, 1906, 12 distinct pieces of research work were in progress. At many others a large amount of attention is paid to poultry, notably at Kingston, Rhode Island; Stores, Conn.; Geneva, N.Y.; Morgantown, West Virginia; Logan, Utah; and Orono, Maine, in the States; and at Ottawa and Guelph in Canada. Of these Geneva and Ottawa are entirely devoted to experimental work, but the others are associated with Agricultural colleges. The bulletins containing reports are disseminated widely, and Geneva has a total of 40,751 names on its mailing list. I may say that the United States Government carry these reports free, so that, of course, that makes a good deal of difference.

6171b *Farmers' Institutes.*—One of the most valuable means of instructing farmers who are unable to attend college courses, and of disseminating the knowledge gained by experimental work, is by what are called Farmers' Institutes, and they are becoming increasingly popular both in Canada and the United States. These are arranged to be held either at one of the agricultural colleges or a convenient centre of a given district. In the former case an opportunity is afforded of inspecting the college and its various sections of farm and other work. Usually they are only for one day, but sometimes longer. Generally one branch only is dealt with. Specialists are engaged to speak, and the audience is invited to ask questions. I attended at two of these meetings last year, and about 250 persons were present at each, but I heard of cases where 1,000 had attended. One of the officials at Washington informed me that in the Southern States these Farmers' Institutes had done more to awaken interest in progressive agriculture than any other method tried. From the educational point of view, in so far as existing farmers are concerned, they are of the greatest value, and I do not doubt but that they do much to encourage farmers to send their sons and daughters to the agricultural colleges. The expense involved is chiefly for printing and payment of speakers, as visitors pay for their meals, except where hospitality is given.

6171c *Suggestions.*—With the rapidly increasing development of the poultry industry in this country, there is a growing demand for managers of poultry farms and of working poultrymen. My estimate is that the value of poultry produce in Britain in 1906 was at least £2,000,000 greater than in 1895, a large portion of which is the result of educational work. We are totally unable to meet the demand for qualified men. Many of those trained have commenced poultry farms, and this class is often a little above that required. We have touched only to a limited extent the working poultryman, as to him the fees have proved prohibitive.

6171d Scholarships granted either by the Board of Agriculture or by County Councils, not for short courses but for training over at least six months, would be most valuable. In some cases these might be open to town residents who desire to take up work in the rural districts. I have known many likely students who could not afford the fees and living. Scholarships of £40 would cover the expense of six months' training, and might be thrown open to competition. The college has offered scholarships for advanced courses, but these provide only for the fees.

6171e In my judgment a college poultry farm doing such educational work as the one under review can only fulfil its mission adequately by being placed under the control of a public body or institution. The difficulty is largely financial. We need £300 for further equipment for educational purposes.

A grant is required for maintenance. The staff is insufficient, but on the present basis cannot be extended. 6171f Two branches of poultry-keeping have never been adequately dealt with because they necessitated special

assistance which we could not provide for. If such grants were sufficient fees might be reduced, and an increase of students would probably result, or present students be able to take longer courses.

Experimental work could, and should, be greatly extended. But this is costly in time and equipment, and requires adequate financial support. Experiments necessitate qualified assistance.

An important need is the establishment of a National Diploma in Aviculture, similar to that for Agriculture and Dairying, with an independent Examining Board, to which all colleges and training centres could send their students. That would give a great impetus to advanced teaching in this subject. I have tried for years to secure such an examination, but hitherto without success, mainly by reason of the expense.

6172. What is the length of course that you consider desirable for giving the fullest teaching in poultry-keeping?—A point that I have always held forward has been that no one can succeed in poultry-keeping without knowing something of general agriculture. The basis must be the same in both cases, and it is for that reason that I, in the first place, wanted to be in association with an agricultural college, because I do not believe it can be done otherwise. I do not believe for a single moment in what is called poultry farming by itself; it must be associated with cultivation in one form or another. Consequently under those circumstances if we had students who have no experience in agriculture, then the 12 months' course is provided for them; that gives six months' training in general agriculture and six months specialisation in poultry-keeping. Where you have students who are already acquainted with agricultural methods, six months is quite sufficient if they are of an ordinary intelligent character.

6173. Where they have, as at Reading, the diploma, six months is sufficient?—Six months is sufficient from the poultry-keeping point of view.

6174. (*By Lord Barnard.*) I am not quite sure whether these various classes of students to which you have directed our attention are students of Reading College or not—for instance, the pupils on farm?—The whole of the arrangements are made by the college. We never accept a student except through the college. They are not registered as in-college students unless they take one of the courses.

6175. Then as to fees, what are the fees that the people whom you describe as pupils on farm pay?—The fee for three months is £10. and for a lesser period than that £1 per week.

6176. (*By the Chairman.*) Where do they reside?—In Theale, that is five miles from Reading.

6177. (*By Lord Barnard.*) What class of people are they—they are both sexes, are they not?—Yes, we have both sexes.

6178. What class of people are they, and do you know at all what they are going to become ultimately?—A considerable number of our students have taken up the work of teaching, either at home or abroad. In addition to that we have had only a few of what might be termed the farming section of the community. A great number of them have been men and women who have desired to start poultry establishments, or in some cases were the sons and daughters of large farmers who intended to carry out the work in association with their parents' farms, but we have never reached the working poultryman class at all.

6179. Even the pupils on the farm do not go down to the working class?—Only a very small percentage of them. Last year we had three or four of those amongst the farm pupils, who were sent there by their employers for special training in certain directions.

6180. You do undertake that kind of instruction?—Certainly.

6181. Where do they reside?—In the village. We have created the accommodation. In one year our students paid in the village £900 for their board and lodging. It is a large amount of money, and I was very surprised at it myself.

6182. To go to a more general aspect of the question, I gather from what you say that you attach very great importance to the combination of research work and instruction?—Distinctly so.

6183. Do you think they can be carried on side-by-side better than one separately in one place and another in another?—That would depend upon the nature of the research work. If it were pure scientific research,

6171g

that would not be so, but the moment that you come to what we may term experimental work then I believe that it is an absolute necessity to have the two side by side. It enables you to broaden your outlook, and to do a great deal more than you otherwise could do. In America there are two purely experimental stations. In some directions I think they have done splendid work. In other ways I take it the Agricultural Colleges with experimental stations have succeeded better.

6184. To look at it from the side of teaching itself and experimental work, do you consider it is an advantage to students that experimental work, perhaps not of a very advanced order, should be carried on by the staff of the institution to which they are affiliated?—Distinctly so.

6185. As you have touched on the question of Government aid, and that sort of thing, I suppose you would agree that any increased Government assistance would probably be accompanied by some increased measure of Government control?—It ought to be so.

6186. Have you any suggestion to make on that point?—What I hope in that connection is that with some control, say of the Board of Agriculture, we should avoid in poultry-keeping what has been a weakness in general agriculture, namely, the overlapping of experiments, and if we had a central authority that was contributing towards research work it would have the right to suggest to one college: "We want you to take up this branch," and to another college: "We want you to take up that branch." It might be found that one college could do a particular piece of work better than any other because of the peculiar local conditions.

6187. You would like the Intelligence Division of the Board of Agriculture to be extended to take up that work?—Yes—whatever department it may be.

6188. Have you heard of the suggestion to appoint a central committee consisting of representatives from the various districts to deal with that matter and the collection of the results of experiments and so on?—Yes. I think it is a most desirable thing. I may say that I spent some days in America, at Washington, interviewing the heads of the various departments there, and I found that was already in existence in the States—that they have an experimental section. I do not know whether you have had before you the *Experiment Station Record* that they publish every month.

6189. We hope to have them?—It is a most valuable thing. They have specialists, such men as Dr. Curtice, and if there is any disease that breaks out in any part of the country these are at once sent down to look after it and to enquire into it. We have nothing of that kind in England. I have been consulted myself by the Board of Agriculture when disease has broken out, but of course I could not go down and enquire into it.

6190. From your experience in the United States and Canada, is it your opinion that this Government control and subsidy is appreciated by those interested in agriculture?—I think so.

6191. Is it largely made use of?—It is a kindly control. I think they give a very great amount of liberty to the local State, only they have the records sent up regularly, and if there is anything arises that calls for their supervision, of course they use their power.

6192. From your observation do you think that the Government assistance in America is of great practical benefit?—My visit was hardly long enough to enable me to say that, but I never heard during the course of my stay there one single complaint with regard to it, and I think if there had been reason I should probably have done so.

6193. (*By Lord Belper.*) I think you agree as to the importance of poultry instruction being combined with general instruction in agriculture?—That is so.

6194. Your poultry farm is at Theale?—Yes.

6195. Do the students learn their general instruction in agriculture there?—No, the farm is at Shinfield, on the other side of Reading.

6196. Do the same students go to both?—So far as the agricultural students are concerned, they have not had anything more than lectures, and when they want poultry-keeping they come to us as a special establishment.

6197. You do not carry out to the full extent your view that they should have the opportunity of combining their agriculture with their poultry teaching?—Not in the practice, but we do in the teaching.

6198. I suppose, therefore, you would consider that the

teaching of poultry-keeping, if taught to the best advantage, could be best combined in some agricultural college where the other branches of agriculture are taught?—That has been my idea all through, and that has been my practice, except so far as the farm is concerned. We are compelled to specialise. Where you come to special teaching I do not see how you can help it.

6199. I see you have the various courses with regard to poultry teaching—what you call a short course and a terminal course. Those vary, I suppose, according to the requirements of the students as to how far they want scientific teaching in aviculture?—If I understand your question, perhaps I can answer it by saying that those students who come specially for that period devote their whole time to the poultry work, excepting that they have lectures on general agricultural subjects in the college as part of these different courses.

6200. I think you referred to research work in connection with poultry teaching. I conclude you mean rather what we should generally call experimental work?—Yes.

6201. Research work in the sense that requires scientific research; there are not so many openings in poultry keeping for that as there are perhaps in other branches of agriculture, plant growing, and so on?—I do not think there would be quite as many as in some other directions.

6202. You rather think it is an advantage to the student to see what is going on in the way of experimental work while he is learning the practical work?—Yes. We have an experiment going on at the present moment, for instance, which might be almost termed research work, on your basis—artificial incubation. That is most valuable in its results to the students; it enables them to see what they could not otherwise do, and of course in other ways as well.

6203. That, of course, must be carried on under somebody who is sufficiently scientific to ensure that the conditions are all properly fulfilled and so on?—Certainly. My son, who has charge of that, was Chemical Demonstrator at the college for some time, and has had a scientific training. He was a student of Leipsic University.

6204. With regard to the scientific side of the question, your view is that a very much larger grant should be given not only for agricultural instruction generally, but especially for poultry purposes?—Certainly.

6205. The United States give a very substantial sum for those purposes?—Yes, they give a lot of money.

6206. Has the giving of that money, so far as you can judge, borne good fruit?—I think it has.

6207. They seem to be very large grants?—Yes, very large sums.

6208. Are those entirely used for poultry?—No, not for poultry specially—they are for agricultural purposes. At the present time I believe they have four men travelling in the interior of China seeking for edible agricultural plants. Of course we should not want such a large sum of money.

6209. Your remarks were principally alluding to poultry. I see you say: "Nearly all the principal colleges until 1906 received £3,000 per annum each from the federal authorities for experimental work in agriculture, but at the beginning of the present year some have had the amount increased to £6,000."—I could not give you any definition of that, but if you look later on in that paragraph you will see it says: "At Storrs College, Connecticut, which has had half the grant to the State (£1,500), of that amount £200 was devoted last year to poultry experiments. That is rather less than one-seventh, and which appears to be a fair proportion." That is, I should take it to be about the proportion; that one-seventh of the agriculture grant is devoted to poultry.

6210. How are these colleges supported apart from the grant that they get from the federal authorities?—Of course they have very great advantages in that way, and they receive appropriations from the different States as well as from the federal government.

6211. These grants are from the United States Government itself?—The top one of those two lines that I gave before, £149,600 comes from the federal authorities at Washington, and the other, the £112,500, comes from the State departments of agriculture.

6212. I suppose they receive fees from the students?—No—the inter-State students are admitted free.

6213. Every student coming from the State itself?—Every student in that individual State, I believe.

6214. What about a foreigner from another State?—They have to pay fees.

Mr. E. Brown. 6215. You are Secretary, I see, of the National Poultry Organisation Society as well?—Yes.
5 June 1907.

6216. Is that doing good work?—Yes. That has helped us very greatly in the extension of co-operation in relation to the marketing of produce.

6217. That, I suppose, is one of the objects of it?—That is one of the leading objects of the Society.

6218. That is in order to spread a knowledge of the value of organisation in different parts of the country?—Certainly. The history of this really is, that in connection with the educational work of the counties, and in other ways, we found that we were increasing the production in this country very largely—the industry has grown enormously—and yet at the same time we were being beaten upon our own ground by foreign producers. When one came to inquire into it, it was simply that our system of marketing had not been improved, and consequently we had to set ourselves towards it. I look upon the Society as necessary to the accomplishment of my life's work, because I have been 30 years engaged in promoting this poultry question.

6219. It does not overlap with institutions which give instructions in poultry-keeping, does it?—We do not in any sense give instruction in poultry-keeping where that would be supplied by county councils or colleges. We have plenty of people that ask us for information, which we always give very readily, but we never give any instruction.

6220. I am not sure that I fully appreciate the distinction between this National Poultry Organisation Society and the work which is done in colleges?—No, but there again it comes to be a question of money. If we had been in a foreign country the National Poultry Organisation Society would have been subsidised by the Government, because of its educational work.

6221. So far as I have seen in their papers, I did not fully appreciate that there was a distinct work for them to do outside the work that the colleges themselves are doing in the way of teaching?—Yes, but it is so.

6222. (*By Mr. Lamont.*) On the last page of the very interesting statement which you read to us you say: "Two branches of poultry-keeping have never been adequately dealt with, because they necessitate special assistance which we could not provide for." I should like to ask which two branches those are?—One is fattening, which wants a great deal of enquiry into, and the other is turkey breeding. In the eastern States of America, if I may be just permitted to add that, there has been an enormous outbreak of disease, which I came to the conclusion was due to wrong methods of management, and in my American report, which was published in connection with the National Poultry Organisation Society, I suggested that our Government should absolutely prohibit the importation of live turkeys from America because of this disease. We have had some danger in this country from that direction, but we have never been able to enquire into it because of financial reasons.

6223. You think it possible if science were applied to the breeding of turkeys in such an institution as yours in the way of research work, that probably the causes and prevention of such diseases could be ascertained?—Distinctly. My own feeling with regard to research work of that kind has always been that if it was properly organised in the country, and the Board of Agriculture had authority, we might do a certain part of the research work, and the moment it came to reach beyond our staff we could then hand it on to the central authority for making their superior research, if I might use the term.

6224. Any special point that you felt yourselves incompetent to decide you would refer to them for further examination?—It has been my hope that we should secure that.

6225. Have you done anything in connection with eggs, for instance in the way of establishing a dépôt for the collection and marketing of eggs?—Personally I am responsible for that as Secretary of the National Poultry Organisation Society.

6226. I know you are well acquainted with what has been done in Denmark on those lines. Have you introduced that into the teaching at your farm?—Nothing more than mentioning it in the lectures.

6227. I understand you do not to any great extent foster the production of eggs there—I mean as eggs. You rather intend that they should be for breeding?—No, because we make a very important point in our teaching as to improvements in the production of the different races of poultry by selection. We use there what is known

as the trap nest system. We instruct our students in the use of it, and also in the development of the egg-laying. At this present moment we are having an experiment going on at Theale which will take, say, twelve months, one of the results of my visit to America. This is a copy of what has just been sent out to the Press. (*Handing document.*) We are testing a new system of feeding which I came across in America, and that is for the production of eggs entirely.

6228. To go back to this question of fees, is any special charge made for a poultry course to students who are taking the whole of the agricultural course at Reading, or are the fees which are charged at Reading for the agricultural course inclusive of the poultry course for the students desiring to take that?—The fees for the agricultural course at Reading would include certain lectures which I give to agricultural students, but if they desire to take up the poultry work through short or long courses, they would be additional. Part of that, of course, is owing to the arrangement between the college and myself.

6229. Both your practical course and the lectures, of course, go on during all seasons of the year?—Yes.

6230. At Cornell they are chiefly winter courses?—Yes.

6231. In the *Cornell Register* they say: "The lectures in this course will be given between Christmas and Easter, and the practice will be given only after the Easter recess?"—Yes.

6232. Yours, in that respect, is a very much better system, I take it, than at Cornell?—We could not do it on their basis. I think that is explained by the fact that at Cornell they have a large grant for experimental work which they must earn, and they devote the other periods of the year mainly to experimental work.

6233. In amplification of what you said, might I just read this with regard to the tuition of the students at Cornell College? I am reading from the *Register*: "Tuition is free to the students with State scholarships; to New York State students in the State Veterinary College and in the College of Forestry; to students pursuing the prescribed course in Agriculture and intending to complete that course; and to special and graduate students in Agriculture taking at least two-thirds of their entire work in the departments of agriculture, horticulture, and in the courses in agricultural chemistry," and so on?—Yes.

6234. You say in your notes "Provision is made in America whereby poor students are able to obtain employment in order to pay for board and lodgings, such employment being in or out of the College as the case may be." That came under my knowledge to a great extent. A great many students, not only in Cornell, but even in the more classical Universities, during their summer vacation get employment as waiters in some of the fashionable restaurants, and as pursers on pleasure steamers, and so on, and by that means make a certain amount of money, and are able to pay for their board and lodging?—Yes.

6235. Do you think that could be done in this country without the students feeling that they were losing caste?—That is the serious difficulty in this country. I came across a case at Cornell of a man who had taken his full four years course and his degree. He told me that he had no money when he went there. He was a very intelligent man. He told me that he sometimes used to drive the college team or to cut the grass there, and I said, "What about your fellow-students?" He said, "Well, I was secretary of the Cosmopolitan Club, and after driving home the team I used to change into my dress suit and go in amongst them, and was received just the same as the others." It is the students we have to fight here in that respect, not the teachers.

6236. (*By Mr. Latham.*) You have been speaking of lectures on agriculture, but you do not give these?—No; I do not lecture on agriculture.

6237. To what extent do you lecture in the counties generally?—I have lectured in 17 counties, but have not time for that work now.

6238. I perfectly understand that, but have they been very general?—Yes, all over the country.

6239. Are they well attended?—Very well attended. Of course, there were differences, but as a rule at those lectures we used to get very good attendances.

6240. There is a very great deal of interest in poultry-keeping in Sussex, is there not?—A great deal.

6241. You have not lectured in Sussex, have you?—No.

Poultry-keeping is a very highly specialised industry indeed in that county.

6242. The answer is that they do not require your services?—That would specially apply to the National Poultry Organisation Society. They do not need any organised society in their marketing down there, because their marketing is so thoroughly well organised amongst themselves now.

6243. The students who come to you all come with a great anxiety to take poultry-keeping up?—Yes, the great majority come to us for that purpose.

6244. They are all college students who come to you?—Yes, we do not accept any students except through the college.

6245. I agree with the remark you made, that it would be a great advantage, not only to your institution, but all institutions of a similar character, if they could be attached to a farm where they could get agricultural teaching.—Yes, of course; what I hope we shall do at Shinfield will be to teach poultry-keeping as part of the regular agriculture, and have the practical work done at Shinfield from a farmer's point of view.

6246. The farm at Shinfield is such a new departure for the college that there has not been time yet to get any of the poultry teaching taken there?—That is so. The Shinfield farm was bought primarily for agriculture without regard to poultry, and there are certain difficulties at Shinfield. For instance, it is a country that is infested with foxes, for one thing, and it would be a little difficult in that respect. We should have to make special provision for that, and then again the land is not very suitable for poultry.

6247. You have made some rather strong remarks about the breeding of turkeys in England. There are some districts where turkey breeding is exceedingly successful, are there not?—Yes, certainly, but that may be explained by this statement, that a system which is suitable where a few birds are kept around a homestead is no longer suitable when you increase the number beyond the capacity of that immediate land to deal with. At the present moment there is a tremendous outbreak of disease in Italy, simply because they have increased their birds beyond the capacity of the land, and that is also taking place at the present time in America with regard to turkeys.

6248. You have said that Dr. Curtice was engaged in enquiries as to a disease in America in turkeys. That is called "blackhead"?—Yes.

6249. Is that an English disease?—No, I am not aware of a single case here.

6250. Will you kindly tell us what the disease is?—It is really a disease due to bad conditions, in which there is a great inflammation from the presence of a microbe in the system. It is the discovery of this that they have been working at for three years.

6251. (*By Professor Middleton.*) Can you tell us how the disease shows itself?—The head turns black, there is a very high temperature, a gradual loss of flesh, and the bird dies in a feverish condition.

6252. Is there a great swelling about the nose?—No, it is not that. The red on the face turns almost black. Every country has its own diseases in these things.

6253. (*By Mr. Latham.*) With regard to this question of free grants in America, is it not only free grants in poultry-keeping, but to all the agricultural subjects?—That is so distinctly, but the lesser is involved in the greater.

6254. We are paying an enormous amount of money for foreign poultry, eggs, etc., and do you not think with better management and treatment we could increase the production very largely?—Yes; we have increased it very largely in the past, and we can do more in the future.

6255. Agriculturists have not taken much interest in it, I am afraid?—They are a great deal better than they used to be. There has been a wonderful development in that direction, but still a great deal more might be done.

6256. It is the special man or woman that is doing it, not the general agriculturists?—In some districts that would be so, but not in others. At the present time we have only about three-quarters of a fowl per acre of cultivated land in this country. We could treble that without difficulty, and without interfering with the present crops, or anything.

6257. The price we get for our produce compares favour-

ably with the price given for foreign birds?—It is very much better. *Mr. E. Brown.*

6258. Does what you have said with regard to the increase in production apply to eggs as well?—Yes, the increase has been the same, and it is increasing.

6259. That is not the result so much of practical knowledge, but rather from the way in which scientific knowledge has contributed?—Yes, one has worked with the other.

6260. You make this remark in your statement with regard to the short courses, "At first these occupied three weeks, afterwards increased to four weeks, and in 1900 further extended to five weeks, at which they remain." Does that mean that the series of courses you give merely extended in length, or that there was more science given?—There was more science brought in.

6261. That is more difficult to get into short courses?—Yes, and more practical instruction was given to them at the farm. As soon as we got the farm they could do more.

6262. If you had a sufficient amount of money allocated to you, you could do a great deal more in practical work?—Certainly.

6263. With regard to your farm, you do very little scientific work at the farm?—We have done these various experiments, and we are constantly, as far as we can, doing experimental work, but it means a great deal of time. You will find these recorded in the experimental report published by the College. During the last twelve months we have been engaged in an experiment dealing with the value of poultry manure. The result was published in the *Journal of the Board of Agriculture* in March. It shows the value of the different classes of manure, and how it can best be used, and our reports with regard to the cost and the growth of chickens have enormously stimulated the production of table poultry, because people can see that it is a profitable thing to take up.

6264. Your little farm has been successful almost beyond your own anticipations?—Yes, from the educational point of view, but not financially.

6265. It has been thought that you have not been very well treated financially?—I should not like to say that. When I started the farm, and this was afterwards confirmed, it was an understood thing that the farm would be taken over by the College, and that I should not be allowed to lose by it. I have put a considerable sum of money into it, and I hope it will be taken over so that it may be continued as an educational and experimental establishment.

6266. Up to the present that hope has not been realised?—Not yet.

6267. Do you get many ladies come to you?—Yes, at the present time we have 12 students on the farm, of whom five are ladies.

6268. Had Lady Warwick's College anything to do with you—had you any students from there?—We had them in the early days because they went to the college. When the hostel was at Reading they were part of the college, and then we had their students, but not since then.

6269. You have nothing to do with the teaching at Studley now, have you?—Nothing.

6270. Was not a great deal of the success of that hostel due to you?—I suppose I had my share in it; I was the teacher in this subject.

6271. Could you give us any definition of what these pupils are on the farm. They are pupils—I perfectly understand that part of it, but what class do they come from or belong to. You have given us rather a large number attending the courses, 435, and a total number of 517. What are those students principally?—Out of those I suppose there must have been about 60 that were sent over from Ireland for the purpose of being trained as instructresses for the Irish County Councils. With regard to the others, we have had all classes of people, the main part of them are young men and women who have been desiring either to go out to the Colonies, or to take up poultry-keeping as a special industry.

6272. I suppose you are perfectly well aware, and particularly in Berkshire I think it is so, that a great many of the agricultural labourers are now keeping poultry. Have you given them any education?—No, I have never touched that at all, except by the County Council lectures. I lectured for three years for the Berkshire County Council.

6273. I perfectly understand you lectured to a certain class, but you have never been asked by the Parish Councils, for instance, to go in and lecture to the labourers?—No.

Mr. E. Brown.
5 June, 1907.

Mr. E. Brown. 6274. Do you think that could be done with good effect?—I think with regard to the kind of teaching in which there is less responsibility for making reports—by which we would get into touch with the people personally, if you had the right class of teacher there is a great deal to be done in that way.

5 June, 1907.

6275. What do you mean by the responsibility for making reports?—If you give a lecture, and you have so many people there, that can be put on paper and published, but if you go and talk to a man in his cottage and show him how to carry out his work better, you cannot put that into a report to the County Council, and so there is not the same record.

6276. I certainly agree in that respect, but all stewards must give some account of their stewardship, you know?—I think that is so.

6277. Having regard to the small holdings question, almost all small holders would be better off if they kept poultry, would they not?—Yes. If you take a country like Wales, where poultry are largely kept, and kept very badly, if a man who understood his subject was given *carte blanche* to go up and down and advise the people, and show them better methods, stopping a week or a fortnight at one place if it was necessary, the increase in the Principality alone through better methods being adopted in the course of a few years would involve a tremendous sum of money.

6278. (*By Professor Middleton.*) You have felt the need for more research being done?—That is so.

6279. There are many unsettled problems in poultry-keeping?—Yes.

6280. I should like you to indicate to us what you consider the most important type of problems. Are they connected with the feeding, the management, or the diseases of poultry?—So far as the management is concerned, if you take the question of housing, we have practically settled that question without any public grants. We have worked our way through that. The problems that present themselves at the present time are largely in the direction of artificial hatching and rearing. There again we have settled one part of the problem by what is known as the dry feeding system. Our losses in three years by artificial rearing amounted at one time to 45 per cent., but by experimental work and by adopting a different method of feeding we reduced that to 5 per cent., which made all the difference in profit. Then there is a great deal to be done in the way of feeding both for general purposes and for fattening purposes, whilst the subject of disease is practically untouched as yet.

6281. You yourselves as poultry-keepers would be competent to undertake the type of experiment that you have outlined under the first two headings; artificial hatching and rearing?—Up to a certain point. You want the practical man to face the question and work with the pathologist and scientist.

6282. (*By Mr. Latham.*) Can you give us any poultry establishment which is carried on at a profit?—You have opened a very wide question. The point is this: there are two ways of looking at poultry-keeping. The farmer, by simply adding poultry to his farm stock, ought to be able to make a profit from the first hen he keeps if he manages it properly, but the moment you specialise then

all the basal cost, the establishment charges, have to be met from the poultry themselves, and under those circumstances it is necessary to carry it out on a large enough scale to give an adequate return. For instance, if we allow a fair estimate, it is not an excessive one, that you make a profit of 5s. per hen per annum, 1,000 hens would only give you a profit of £250. Out of that you would have your establishment charges to pay, and consequently no man could make a living out of a 1,000 hens alone; he would have to keep more. In America, at Lakewood, one place at which I was, they keep as many as 4,500 hens. Consequently the specialist establishment is an establishment where they must produce eggs for hatching and add other profitable branches. It is exactly the same as if you travel down to Reading, you see Sutton's and other nursery gardens. They could only spend the money they do by catering for those who are willing to pay the higher prices for supplies for their private gardens, not from a marketing point of view.

6283. (*By the Chairman.*) Do I understand that your case is that the agricultural students at the college in every case should be trained in aviculture?—Only to a limited extent. I think the way you are bound to deal with it is this, that every agricultural student coming to the college should have lectures upon poultry-keeping as part of his course. I give 20 lectures to the in-college students every year as part of their course. What I hope we shall arrive at at Reading is that upon the agricultural farm at Shinfield we shall keep a number of poultry in the same way that a farmer would keep a few fowls, and the student will be able to obtain a certain amount of practical knowledge, but as soon as ever he wants to specialise, exactly as in dairying or as in horticulture, he must then take a course at the special establishment where that is taught.

6284. Some of the students who have obtained the agricultural diploma at the college afterwards come for courses at the college poultry farm?—That is so.

6285. Those are specialists?—Yes, they specialise upon that subject.

6286. Your opinion is that the teaching which should be given to the general agricultural student should be of a different nature from the teaching which is given to the special student?—It would be of an elementary nature.

6287. Does it include visits to your farm?—They generally pay one visit a year; that is all.

6288. The training is different at your farm?—The training is special.

6289. With regard to your students, those who specialise, is it necessary in every case—I am not talking of those who come for the five weeks or the ten weeks, but of your best poultry student—that they should have had a preliminary agricultural course at the college?—Certainly, that is always what I aim to get; that they must understand something about agriculture.

6290. Therefore we can summarise it in this way, that the agricultural student must have a certain elementary knowledge of aviculture?—Certainly.

6291. And on the other hand, the poultry student, the student whose main object is to specialise in aviculture, you consider that he must have a preliminary training in agriculture?—Distinctly so.

Mr. H. R. MILL, D.Sc., LL.D., called and examined.

Dr. H. R. Mill.

6292. (*By the Chairman.*) You are the President of the Royal Meteorological Society?—I am.

6293. The Council of the Royal Meteorological Society has been considering the best means of promoting the study of meteorology in the belief that increased knowledge of the principles of the science on the part of the public would result in many practical advantages?—That is so.

6294. You have appointed a lecturer to visit various parts of the country?—Yes.

6295. Perhaps you will explain to the Committee what the Society intend to accomplish by those lectures?—The idea of those lectures is to increase the interest in the science of meteorology. The lectures at present have been arranged chiefly with the local scientific societies, and also in connection with certain schools. The lecturer has a certain number of subjects which are selected by the centre

to which he goes, and these lectures have usually been attended by considerable numbers of people. The object we had in view was to increase the interest, rather than to impart full instruction; and of course the Society is always prepared to answer any questions on the subject that may be addressed to it, to recommend text books, and generally to assist in disseminating a knowledge of meteorology in every way.

6296. Who bears the cost of these lectures?—The cost of these lectures is borne partly by a guarantee fund subscribed by Fellows of the Society, and partly by the various institutions to which the lectures are given. Hitherto I think the various institutions have practically defrayed the out-of-pocket expenses, and the Society has paid the lecturer.

6297. The salary of the lecturer is provided by the

Society?—Yes. The lecturer, as a matter of fact, is the Assistant Secretary of the Society, and he gets leave of absence from his other duties in order to enable him to carry out this work.

6298. Those lectures have been given throughout England?—Yes, in various parts of England, and I think on one occasion we went across the border into Scotland.

6299. They have been well attended?—They have been very well attended. I may mention that lectures have been given by other members of the Society also. I have personally given a good many Gilchrist lectures on various subjects connected with the weather. They are purely popular lectures, but they have satisfied me that the desire for information is strong and the interest is quite lively.

6300. Those lectures are attended largely by farmers?—They are attended largely by the people of the neighbourhood. The Gilchrist lectures are attended more by the industrial classes, because populous centres are usually selected, but the other lectures have been attended very largely by farmers, and frequently have been given in connection with agricultural exhibitions.

6301. In connection with agricultural shows, you exhibit a complete second-order meteorological station?—Yes, we keep one of these exhibits ready to send out. In connection with the Lincoln Show of the Royal Agricultural Society this month, we have prepared a special exhibit, including a number of charts and diagrams which have been specially prepared, as well as meteorological instruments. That will be attended by the Assistant Secretary of the Society, who will give the fullest information possible to everyone enquiring. It was extremely successful at the last show that was held at Park Royal. The meteorological exhibition was visited then by a very large number of people.

6302. You consider that while all classes, of course, need instruction in meteorology, those who cultivate the soil, and those who are at sea, have a special and direct interest in the knowledge of meteorology?—Yes, their interest is more direct than the others. Of course at one time farmers, sailors and fishermen knew more about the weather than any other people, and they were better able to predict the weather than any other people, but that is no longer the case, because the growth of scientific knowledge has put the old rule-of-thumb knowledge quite in the background, and much more precise information can now be obtained by reading the weather reports and attending to meteorological instruments than by simply watching the signs of the sky.

6303. You think that a farmer ought to have sufficient knowledge to be able to understand an isobaric chart, and to grasp the bearings of the Weekly Weather Report?—I think that is very essential. The Weekly Weather Report in particular is compiled at the public expense mainly for the benefit of farmers, and I am afraid that a very large number of farmers are not able to profit by this expenditure of public money on their behalf, because of their inability to understand it.

6304. You think it would be desirable to disseminate that Weekly Weather Report at a minimum of cost?—I think it would be most desirable. At present it costs 30s. a year. I do not speak with authority because I do not belong to the Meteorological Office, but the number of subscribers is, I believe, very small, while, of course, the publication cannot possibly be made self-supporting, and as the work is done it would cost comparatively little more to scatter it widely over the country.

6305. We have just been told that in the United States a great deal is done in the way of disseminating information, for instance, by free distribution. There is no postage charged by the Government, although, of course, that is rather a small matter?—That is so. In the United States they make every possible effort to distribute the information as widely as possible, for instance, by means of special signals on trains in the Far West, and in many other ways by the Weather Bureau, which is under the Department of Agriculture, and which is always ready to send out any amount of its literature to anyone that asks for it.

6306. Are you aware whether any farmers' clubs throughout the country subscribe to this weather report?—I know a certain number do, and a certain number take advantage of the special hay harvest forecasts, and of the special corn harvest forecasts, but the number is very small.

6307. You are at present in correspondence with the various agricultural colleges and with some of the educational authorities in different parts of the country with the object of ascertaining to what extent instruction

in meteorology is now being given?—Yes, there is a special Committee of the Royal Meteorological Society which has been charged with that work.

6308. In several cases a full answer has been postponed?—Yes. The letter to the different authorities was only sent out about six weeks ago, and we expect to get further information at a later date, but in several cases we have seen the syllabuses of the colleges, and we find the state of education in this particular subject to be far from satisfactory.

6309. In some of the colleges instruction in meteorology is given incidentally in relation to other subjects?—Yes.

6310. In most of the colleges there are meteorological instruments?—Yes. I think I might almost say in all of the colleges there are meteorological instruments, and in some of them they are good instruments, well observed, and we know they are being made use of to the utmost.

6311. That the observations are kept with precision and regularity?—That is so.

6312. You are not prepared to say that that is applicable, to all?—No; I cannot say positively that it is not, but from the want of information I very much suspect that it is not.

6313. Of course an ill-equipped or badly-appointed meteorological station would go far to undo the educational value of scientific observations?—Entirely so.

6314. And would really be worse than no observations at all?—Very much worse, because it would teach a sort of contempt of the instruments and the records.

6315. Your Society is of opinion that provision should be made in all agricultural and horticultural colleges, and in technical schools in rural districts, for instruction in meteorology?—Yes, very strongly.

6316. Would you give the reasons to the Committee for that suggestion?—The main reason is that it would enable farmers and gardeners to make use, to the full extent, of the existing means of information regarding the climate and weather—including the publications of the Meteorological Office. These publications are produced at public expense, but as I have just said, they are sent out at present only to subscribers. A good many of the predictions produced by the Office are published in the newspapers, but a great many of the farmers are not able to understand these predictions or to benefit by them to any extent. That is the first object that would be kept in view. Then the second object would be, from the scientific point of view, much more important, that is, to direct attention on the part of farmers to the relations between meteorology and the crops, so as to enable them to collect data in order that the relationship between the crops and the weather may be laid down on a thoroughly scientific footing.

6317. The value of that on the meteorological side would be to give purely scientific results, and on the agricultural side the results would be mainly practical?—That is so. The only interest of the Meteorological Society is from the scientific side, but to the farmer the knowledge of the probable weather he is going to experience, and of the probable effect it will have upon his crops, would be of very great practical value. In fact, I know instances. There is one, not a farmer, but a corn merchant, who told me that his knowledge of the laws of the weather enabled him to make a great sum of money every year that he could not otherwise make, by being able to predict in advance the nature of the crop from the nature of the weather; and that sort of thing, of course, could be extended very widely if everyone had the necessary knowledge.

6318. That would be the financial side?—Yes—what I have heard called the practical side.

6319. You have some suggestions to lay before the Committee with regard to the development which could be given to the study of meteorology in those colleges where it is at present recognised, and how it should be introduced into those where it has not as yet been recognised?—Yes. Of course, this is a subject on which I speak with great diffidence, because it is very difficult for an outsider to make a really useful suggestion as to introducing a new subject into a curriculum with which he is not thoroughly acquainted; but almost all the colleges do at present maintain a certain equipment of meteorological instruments, and we would like to see that equipment raised to the level of what is technically called a second-order station, that is, a station with instruments for making all the ordinary observations on the weather at which observations are made by eye twice a day. A first-order station, I may mention, is one where the variations of the elements are recorded by mechanical means. A second-order station is one where the same observations are made, but only at

Dr. H. R.
Mill.

5 June, 1907

Dr. H. R.
Mill.
5 June, 1907.

intervals twice or three times in the day by direct readings of the instruments. We think that such a station might be established in every college, and that all the students ought to be trained to read the instruments and to record the results, under the supervision of a professor or lecturer who would himself require to become thoroughly acquainted with them before he could properly train others. The idea would be that no student should be able to leave the college without having had practical knowledge of the use of the instruments, and of recording the weather. Then again, in order to make this possible, and this is in fact merely a minimum, it would in our view be extremely desirable that the Board of Agriculture and Fisheries should take steps to provide a central course of lectures on observational meteorology to begin with, although the subject might be enlarged afterwards to deal with the more theoretical part of the science, and that the Board should encourage the teachers in the various colleges to attend that course of lectures, and thereby acquire familiarity, or even proficiency, in the use of the various instruments and the general principles of meteorology.

6320. You also suggest that when the system is started it would be advisable to arrange for two students to observe together, one having had previous experience, the other being in training?—Yes. That is just a little practical point intended to show that it would not be necessary for the professor or lecturer to go round the instruments every time the instruments were read, and that one student would be able to teach the other.

6321. You are, of course, aware that at the agricultural colleges the number of subjects already taught is considerable, and the time necessarily limited, but I suppose you would say where the Principal is interested in the subject that these lectures could be easily added to the curriculum without encroaching too much on the time?—I think that that could be done in the great majority of cases, and I believe it might be done in all. It is one of those things in which where there is a will there is usually found a way.

6322. The subject is so interesting that it would, naturally, be an attractive one to the students of the colleges?—I think unquestionably so, and the bearings on agriculture are so direct in many cases that it immediately impresses itself upon the mind of the student.

6323. You think that representations should be made to the Board of Examiners for the National Diploma in Agriculture of the advisability of introducing meteorology as a subject of examination?—I am afraid I personally dislike examinations very much. I have had a great deal of experience as an examiner, and I am sorry to have to think that the screw would have to be put on from that side, but it is the only way. All colleges, and even universities, declare that the requirements for examinations must be worked up to, and if a subject were required for an examination, it would be made practically compulsory.

6324. You would prefer, of course, that the examination should be correlated to the instruction given at the college?—Very much so. Personally, I should prefer that it would be found necessary to introduce it into the examinations because it was realised to be an important subject by the colleges, and it is only in the hope that that recognition might come the more rapidly that I would suggest that any influence should be brought to bear upon the examining Board.

6325. You have given us the syllabus of ten lectures which were given by Dr. Dickson at the University College, Reading?—Yes.

6326. Would you consider that a minimum?—Yes. Dr. Dickson is a member of our Council, and has a thorough scientific knowledge of meteorology, and also has experience of a class of students similar to those in agricultural colleges, and I think his syllabus is an extremely practical one. It is, as you say, a minimum to make a beginning with, but it is very excellently framed.

6327. You believe there is no lack of interest among farmers as to the bearing of meteorology on agriculture?—I am quite sure of that. I may say that in my work, as Director of the British Rainfall Organisation, I am in direct correspondence with about 4,000 people in all parts of the British Isles, of whom I should say quite one-third are either farmers or gardeners, and these carry on observations on rainfall, and many of them on other meteorological elements, and their observations are carried out with both skill and intelligence. They write in an extremely interesting way, and in the volumes of reports which are published annually there are always more than a hundred pages of notes written by those observers. I am sorry I did not bring a volume with me to show the Committee,

but one can easily be sent. Similarly, in connection with the Royal Meteorological Society, Mr Mawley, a member of our Council, has a system of phenological observations, the date of the flowering of plants, the date of the arrival of migratory birds, and so on, and whether the crops are early or late. He also is assisted by a large body of people all over the country, and their assistance in providing data for his report is extremely valuable. The Phenological Reports are published annually in the *Quarterly Journal of the Royal Meteorological Society*, and they prove conclusively that there is a large body of people interested in the subject. I know from other sources also that there is considerable eagerness to acquire the more scientific part of the instruction as well, only the opportunity so far has been wanting.

6328. The Council of the Royal Meteorological Society is fully aware and highly appreciative of the great interest taken in the relation between meteorology and agriculture by the Board of Agriculture?—Yes, certainly.

6329. And your Council are quite prepared to assist the Board of Agriculture in promoting this particular aspect of agricultural education by any means that may be found possible?—Yes, the Council is most anxious to do that. Of course the Council of the Meteorological Society has followed the work of the Board of Agriculture with great interest, and some of the papers—especially a paper recently communicated to the Statistical Society by Mr. Hooker—have been hailed as the beginning of a new era of research into the relations between meteorology and the farm crops. That is a paper on the correlation of weather and crops.

6330. Research, you think, in that direction will yield very important results?—Very important indeed.

6331. You think the number of people engaged in the research work ought to increase?—Certainly.

6332. And that more money ought to be spent in that direction?—I am afraid that will be necessary.

6333. (By Lord Barnard.) I do not quite know whether I understood you rightly to say just now that you were not associated with the Meteorological Office?—That is so.

6334. Would you kindly explain what the Meteorological Office is?—The Meteorological Office is under a Committee appointed by the Treasury to administer a grant of about £15,000 annually. It has two principal duties—one to study the meteorology of the ocean, which it does through its Marine Department, the other to prepare weather reports and weather forecasts for the British Islands, which it does by its Telegraphic Reporting and Forecast Department. It also carries on a considerable amount of research into various problems connected with meteorology. The Office was recently the subject of investigation by a Treasury Committee, and as a result of that investigation it was reconstituted on a new basis.

6335. Do you appear on behalf of the Meteorological Society?—Yes.

6336. Then we must be careful to keep the two things distinct—the Meteorological Office and the Meteorological Society?—Yes, the relation between the two is exactly similar to the relation between the Geological Survey—which is the Government department (under the Board of Education, as it happens)—and the Geological Society, which is an independent society; or it is similar to the relation between the Ordnance Survey, which is under the Board of Agriculture, and the Royal Geographical Society, which is quite distinct.

6337. Are you Secretary to the Meteorological Society?—I am the President of it.

6338. I do not know whether you have studied the terms of reference to this Committee or not?—I have read the terms of reference.

6339. I was going to ask you in what way you would suggest that this Committee could take any action on the evidence which you have given us. The reference to this Committee is: "To enquire as to the provision which has now been made for affording scientific and technical instruction in agriculture in England and Wales, and to report whether, in view of the practical results which have already been obtained, the existing facilities for the purpose are satisfactory and sufficient, and, if not, in what manner they may with advantage be modified or extended." I should like to ask you in what way you suggest this Committee should recommend further facilities in meteorological knowledge as part of scientific and technical instruction in agriculture?—I consider that imparting a knowledge of the methods of meteorology is technical instruction in agriculture to this extent, that it helps a farmer to decide difficult questions that arise occasionally

as to whether he should proceed with a certain agricultural operation in certain conditions of weather, or whether there are sufficient data before him, in the published reports, say, of the Meteorological Office, to justify him in postponing it on the ground that better weather is coming.

6340. Do you suggest that this Committee should put in some recommendation such as this: that we do not consider that higher technical instruction in agricultural science can be complete without a knowledge of meteorology? Would you go as far as that?—I should, I think, almost go as far as that, or I would say at least "without greater attention being devoted to recent results in meteorology."

6341. I gather as a matter of fact that your Society is at the present time endeavouring to impress upon the various agricultural colleges and institutions the necessity for including this subject amongst their other courses of study?—We have not got quite to that stage yet.

6342. You referred to a letter which had been sent out to the different educational authorities?—Yes, a letter asking for information as to what was the state of instruction in meteorology at the present time. As soon as we have satisfied ourselves as to what the state of instruction is, then we propose to write another letter, and we shall perhaps be able to offer more practical suggestions, but in the meantime we wish to find out all we can about the subject before we presume to advise.

6343. You have given us some account of the position which the Meteorological Office occupies. With regard to disseminating practical knowledge on the subject, do you suggest that the Board of Agriculture should discharge the functions of that Office so far as agriculture is concerned?—Not at all, but I should personally have been very glad, as I think I said in evidence before the Treasury Committee, if that Office had been put under the Board of Agriculture, as it is in America, although I do not propose for the moment that the Board of Agriculture should interfere with the present arrangements of that Office.

6344. It occurs to me that there are two other most important industries which are as vitally affected by weather as agriculture is; one of them of course is shipping, and the other, which I believe is affected most of all, is mining?—Undoubtedly shipping is, and the fishing industry, but with regard to mining there is a curious difference of opinion. There is no doubt that great changes of atmospheric pressure do cause outrushes of gas in mines, and it is very important that this should be understood.

6345. Have you any evidence to offer as to the appreciation of agriculturists with regard to the hay and harvest season forecasts? I will tell you why I ask the question: I live in the North of England, in the County of Durham, and I have a considerable number of tenants in the dales where hay is the only crop, and it is of vital importance that they should get their hay crop as satisfactorily as possible. But, as you know, it is a wet district, and I thought it would be of help to those men if I obtained and paid for the forecasts: but although I did that I found that they did not care twopence about it?—That is just where I think they want to be educated.

6346. You think if knowledge of the subject could spread, they would in time come to appreciate the value of it?—Yes. Of course one of the very great difficulties is that people who are only imperfectly educated do not realise the meaning of probability. If they get a hay harvest forecast, and it does not come strictly true, they discredit it for ever after. That is the great difficulty. If you could only get them to understand that in, say, 80 per cent. of the cases they would save their crops although in 20 they might lose them, then I think they would appreciate it very much more.

6347. You are aware of the system of the Board of Agriculture Correspondents?—Yes.

6348. I wonder if anything could be done through them in the way of spreading knowledge of the existence of the work that is done by your Society, and of the great advantage that would be likely to accrue to agriculturists by a knowledge of meteorology?—I think they would be a very good vehicle indeed for spreading a knowledge of the assistance and facilities that might be given by the Society and the Meteorological Office.

6349. How are meteorologists trained at the present day?—I suppose they grow, as a matter of fact?—I am afraid most of them grow.

6350. Do you look forward to the day when you will become more organised in meteorological teaching?—

I do not think so, because there is really no outlet for professional meteorologists in this country. There are certain observations carried out by authority of the municipality in some seaside towns and a few observatories, but there are no remunerative openings for a large number of meteorologists.

6351. Is there more outlet in other countries?—Only from the educational point of view. In Germany there are several meteorological lecturers and professors in the universities.

6352. Do you think it would be of advantage to agriculture if the teachers in elementary schools were equipped to give some slight instruction in meteorology?—I am rather embarrassed in answering that point on account of my position here, because we are not quite at one on the Council on that subject, but personally I would not attempt in an elementary school to teach much of the scientific principles.

6353. We hear a great deal at the present day of the value of nature study for elementary teachers, and it occurred to me that meteorology should go hand in hand with nature study?—Yes, and it has been recommended by the Board of Education for that reason. From some aspects nature study is meteorological study.

6354. Yes, especially with regard to the flowering of plants and subjects of that kind?—Of course.

6355. Am I right in supposing that not only is it very desirable that agriculturists should be able to understand weather forecasts, but that they should generally be able to understand the value and importance of the data to the district in which they are operating?—I think that is certainly very important.

6356. For instance in the district I mentioned just now, the dales in Durham and the Pennine Range district where it is very important to know the amount of moisture in the atmosphere and things of that description?—Certainly. In that district we know very little indeed of the conditions of climate, because there are so few observers. We do know a little about the rainfall, because a number of waterworks engineers take observations bearing upon water supply, but in the district that you name there is very little of the sort, and very few farmers do anything of the kind. It is one of the places that we know least about in the country.

6357. (*By Lord Moreton.*) I understand that the Royal Agricultural Society has been able to add a very attractive exhibit from your Society to its other exhibitions at its Shows. Are you satisfied with the result of your shows?—if I may use the term—at the Royal and other Societies. Do you think they are thoroughly appreciated by the right sort of people?—Yes, I think they are.

6358. You had some very attractive pictures at the last Royal Show of people who had been killed by lightning and that sort of thing?—That is quite a small matter.

6359. Do you think the knowledge gets down to the small man, the man who particularly requires to know about these matters?—I was informed by the Assistant Secretary that a number of just the right sort of people took a great amount of interest in the instruments which were exhibited, about which there is nothing sensational, and as to where they could be obtained, and so on, but as to how far they have acted on that there has not been time yet to judge. My feeling is that by seeing such an exhibit again once or twice they will probably be induced ultimately to acquire instruments and to take observations themselves, and then to enquire the way in which those observations can be usefully applied.

6360. Taking the case of the ordinary farmer who wants to start with a sufficient number of instruments to make his own observations as far as he is capable of doing it, could you give us an idea as to what that would entail upon him in the way of expense nowadays?—Not any great expense. Of course the expense varies with the completeness of the installation, but quite satisfactory thermometers, for instance, can be had that cost only a few shillings each. It is certainly not wise to use too cheap instruments because they are not accurate, and do much more harm than good, but a very good thermometer can be had for about 5s., and one which would be accurate. I would not recommend anything cheaper than that. Then, again, a rain gauge can be got for about 10s. A barometer is a more costly instrument, but that is not so much required really, because everyone is within reach of the weather forecasts in the papers which help one really more than observations of the barometer would do.

6361. In that case one need not be very much frightened with regard to the expenditure that would have to be

Dr. H. R.
Mill.
5 June, 1907.

Dr. H. R. Mill.
5 June, 1907.

incurred to equip oneself with a sufficient apparatus for taking observations?—I do not think so.

6362. (By Mr. Norman Lamont.) Can you tell us how the Meteorological Society is financed?—Like other societies of the kind it is supported entirely by the subscriptions of its members.

6363. There is no Government grant?—No Government grant, and that is rather a grievance, because most other societies at least get their rooms free, but we do not.

6364. It is financed purely by the subscriptions of the members, and also I think I understood you to say there were payments, other than subscriptions, of 30s. a year for the reports?—That is the Meteorological Office. Of course we do sell a certain number of our publications in the Society, the *Quarterly Journal* and the *Meteorological Record*, but the total amount is very trifling; it simply slightly reduces the cost of printing, and the income of the Society is practically entirely from the subscriptions of members.

6365. Do you suppose you would be able to extend your work in useful directions if you had a grant from the Government?—Yes. There are a great many directions in which the work could be extended most usefully, but I may say that at present we are not asking for a grant. Our object is rather to offer any assistance we can give with regard to the organisation of the subject, in the hope that any ultimate profit which might come to us might come in the way of an increased future membership.

6366. With regard to the Meteorological Office, can you tell me to what extent it is dependent on its subscriptions or payments of 30s. a year?—They publish their balance-sheet annually in their report, but I think I may say quite definitely that the amount received in subscriptions for those publications is absolutely trifling.

6367. The reports are issued weekly, I understand?—The special agricultural report is issued weekly, but there is also a daily weather report, the price of which is less. That only comes to £1 per annum, including postage.

6368. I understand the United States Weather Bureau circulates its reports free?—I know they do to a large extent, but whether they are absolutely free to everyone I cannot say.

6369. At any rate they are published in every newspaper, not only throughout the States but throughout the American Continent, and also in the West Indian Islands there is a local branch of the United States Weather Bureau, which is of great value to the planters and growers in those islands?—Yes, the United States have annexed the West Indian Islands from a meteorological point of view.

6370. Do not you think, in view of the numerous studies that are already being taught in the colleges, that it might perhaps introduce complications if we were to add meteorology to the subjects in which instruction is already being given?—I do not think it would if it were added in the right way. I should be inclined to introduce it, as I have already suggested, by systematising the observations of the instruments which are already part of the apparatus of every college. That could be done without interfering with the schedule time at all.

6371. Your idea is to make every farmer his own meteorologist?—I do not say that exactly; what I say is that I would like to make every farmer capable of understanding what is done for him by meteorologists.

6372. Do not you think it would be better rather than the meteorological forecasts should be taken by experts in the agricultural centres, and that advice or suggestions based upon those forecasts should be circulated as widely as possible amongst farmers and agriculturists rather than that time should be taken up by agriculturists in taking those meteorological forecasts for themselves?—Yes. I do not propose for a moment that they should make their own forecasts, but merely that they should be trained sufficiently to appreciate them when they receive them from the meteorologist. It is very similar to learning the alphabet. I want them to be able to read in a scientific sense those forecasts.

6373. Perhaps that is a matter for the elementary schools, as Lord Barnard suggested, rather than for the agricultural centres, whose work we are more directly concerned with in this Committee?—No, I think it is rather beyond the elementary schools. I think the farmer has begun to think sufficiently to be able to appreciate the importance of it: to the child in the elementary schools it would be merely a piece of task work, and I could never hope, I am afraid, to get the elementary teachers sufficiently imbued with a scientific spirit to teach the small

amount that could be taught in a sufficiently intelligent way. It is therefore eminently a subject, in my opinion, for the agricultural colleges.

6374. With regard to what you said as to the difficulty of getting cheap and accurate thermometers, do you know that Stephens' Inks, for instance, circulate thermometers of a very large and costly type free, as an advertisement?—Yes. I have no objection to them circulating the instruments as an advertisement if they would only circulate a Kew certificate along with them.

6375. Do not you think if, for example, Thorley's Food and Sutton's Seed were to be advertised by the distribution of thermometers and barometers that the importance of meteorology would be more widely realised?—I think it would be a most admirable thing to do. I may say that one of my great difficulties is to induce some of the leading seedsmen and people who sell rain gauges, and other instruments, to know a good instrument from a bad one. Some of them put in their lists the most shockingly bad things at prices at which they ought to be fairly good.

6376. The people who sell the instruments themselves require to be educated?—Yes; and they could supply good thermometers quite as cheaply as bad ones; it may be indeed that those ink thermometers you spoke of are all right.

6377. I can only say that I have come across one or two of the ink thermometers that are quite right?—No doubt.

6378. (By Professor Middleton.) Your suggestion was that in connection with each agricultural college there should be a group of instruments representing a second-order station, and that students should be taught to use them to make observations, and to draw inferences from the results obtained by the use of those instruments?—Yes.

6379. I think there all of us will agree with you. You would go on to say, however, that we must have meteorology included in the examinations?—I do not say "must." I guarded myself there, but I think it would be very desirable that the examination papers should at least include a mention of meteorology if only to impress it upon the mind of the teacher.

6380. Do you know that that would probably mean that the teacher would say that there must be first a preliminary course in physics and other subjects?—I am afraid that that argument could be employed in any attempt to increase knowledge.

6381. That is so I daresay to a great extent, but the difficulty is that the curriculum at present is overburdened, and there is a disinclination to take up any subject which involves examination. On the other hand, I do not think there would be the same disinclination if one could be assured that examinations would be kept out of sight?—If that really were the case I should be overjoyed, but I should hardly expect that there would be such an elevated sense amongst the teachers, because from my experience as a rule the ordinary teacher or lecturer does not care to add to his curriculum subjects in which there is no examination. There must be a difference since my time.

6382. Speaking as a teacher, I think agricultural students do appreciate, and are very much interested in this particular subject, especially in weather forecasts, and once, in order to test what they were capable of, I took an elementary class of short-course students through some sections of this subject, and found they were more interested in it than in any other part of the course?—So much the better if they can do it without examination; they would satisfy an intelligent examiner if they had an interest in the subject.

6383. Some reference was made to the necessity of making the farmer's son an observer. My experience amongst farmers is that many of them are pretty good observers with one or two instruments, especially with the barometer?—Undoubtedly many of them are.

6384. Farmers, especially in hilly districts I think, use the barometer constantly, and are able to draw very fair inferences from the readings?—No doubt, and if they could at the same time correlate their barometer readings with the weather charts published, say, in *The Times*, or in any weather report, they would be able to avoid some of the errors they otherwise could not help falling into.

6385. That would imply, of course, farmers getting the forecasts in time?—That is the chief trouble, having regard to the geographical position of this country, but now things are improved a bit, and we get telegrams from

Ireland and the Azores which help very materially, and place things on a much more satisfactory basis than they were several years ago.

6386. My experience is that farmers appreciate this kind of thing very much?—Yes, that is also my experience.

6387. And that they make more use of it than they usually get credit for doing. You have referred to recent papers on weather and crops. The kind of information contained in these papers is very well known in a general way to many agriculturists in the country, although it has not been reduced to paper and has not been brought before meteorologists?—I know there is a great deal of general information on the part of individuals, but my feeling was that the time had come now when it might be systematised and made not common but universal.

6388. (*By Mr. Latham.*) Do you think the interest of farmers in these reports is very general?—I think a great many farmers do not understand weather reports, and that if they did understand them the interest would be general.

6389. What education would you give them in order to make them understand them?—My own feeling is that the education I would give them would be to induce them to ask questions and give them an opportunity of having their questions answered.

6390. For some years I got reports sent down to me through the Post Office and I found them very inaccurate. How often do you consider these weather forecasts are accurate and inaccurate?—It depends on the district. In the outlying districts, in the extreme north-west of Scotland, for instance, they are very much less accurate than they are in the south-east of England.

6391. Where do they come from?—They are produced at 63, Victoria Street, by the Meteorological Office, and are based upon telegrams received from all parts of the country, and all parts of the North Atlantic and Europe.

6392. I live in a county where we have some hills and a good deal of vale. Are not they very much upset by the hills surrounding?—Not the severe storms. The severe rainstorms show very little relation to hill or valley.

6393. My experience is that sometimes a storm passes to one side of the hills and sometimes to the other, and that the

farmer gets very little education from the forecasts?—In the case of thunderstorms they are extremely local. In the conditions of weather when thunderstorms are likely to occur, one must, of course, be on the lookout for them, but if you remember the great Thames storm in June, 1903, when it rained in the Thames Valley for 60 hours without intermission—of course, that is a very rare thing to happen—that storm, I believe, was predicted by the Meteorological Office.

6394. How could any forecast possibly foretell that?—By noticing the direction in which the area of low pressure was travelling.

6395. I am one of the unfortunate people who suffered very much from that great rainfall, but I did not see it predicted that it was to last for 60 hours?—I do not say it was predicted that it would last 60 hours, but it was predicted. That storm doubled in its tracks. It passed round to the north-east and then doubled to the south-west.

6396. Lord Barnard put to you whether Correspondents of the Board of Agriculture could not help considerably in distributing these forecasts. How do you think that is possible?—I think they could help by disseminating a knowledge of the forecasts in their particular localities, and, I may say, from the point of view of the Royal Meteorological Society we would be quite as much pleased if the result was to bring about intelligent criticism of the weather reports issued in this country.

6397. How could Correspondents assist in distributing them?—They could tell many farmers who do not now know anything about either the Meteorological Office or its forecasts.

6398. What I understand upon that is that when you send the information down to us, we should let the farmers in general know that it will be sent to them or to the Post Offices if they wish it?—To let them know generally that they are already paying for an expensive meteorological department and that it is desirable that they should get their money's worth by finding out what the Department is doing, and if it is not acting to their satisfaction, means might be found for its improvement. I think it would be a very desirable thing if every farmer were sufficiently interested to criticise the meteorological forecasts in a way that would be helpful to those who prepare them.

Dr. H. R. Milk.

5 June, 1907.

Mr. E. VINCENT V. WHEELER, called and examined.

6399. (*By the Chairman.*) You are past Chairman of the Agricultural Sub-Committee of the Worcestershire County Council?—Yes.

6400. And Vice-Chairman of the Worcestershire County Council?—I am.

6401. You are prepared to give the Committee some evidence on the need for more or less advanced institutions, readily accessible, to which students of the ages of 13 or 14 might go?—Yes. I find the sons of the farmers who, I take it, are the lads we want to keep on farms, and at the same time give them a certain amount of scientific education, as a rule go on to their fathers' farms as soon as they have done at the elementary schools, and very often learn little more. My idea is you ought to get the whole of those boys and find a suitable school to send them to where they would continue their ordinary education, and at the same time learn a certain amount of practical agriculture—boys from the age of 13 or 14 up to 17.

6402. Is that immediately after they leave the elementary school?—Immediately after they leave the elementary school, because there is so very much danger that if they once go on to the farms they will never come off again.

6403. The instruction should be practical in such a school?—Yes, I should not have too large a farm—not to make the boys do a great deal of practical work, but just enough land to make them interested in farm work.

6404. How long would you keep them there?—Say for three years up to the age of 17—from 13 or 14 up to the age of about 17.

6405. That would be a practical education and also a continuation of their general education on elementary lines?—Yes. Then from there I thought the more promising boys could be sent to the higher collegiate institutions, of which we have several now—such places as the Harper-Adams and the Wye College.

6406. Those would be boys from the age of 17 to 19?—Yes. Those would be the boys who would be likely to follow it up from the scientific point of view.

6407. You think there should be first these practical schools which you have described, and then that more advanced instruction should be organised in every county?—Yes. At present I do not think there is enough demand to justify us in establishing a higher institution, but probably in time the demand would be created.

6408. They would act as feeders for the higher school?—Yes.

6409. Pending the establishment of those schools you would send them to the nearest collegiate institution?—Yes. That we do at present: we give £50 a year scholarships to send boys to what you may call the higher school, but what leads me to my opinion is that there has been very little demand for those scholarships. We have at the present time only two running, and I think during the whole time I have been Chairman of the Agricultural Committee we have only given I think six. That shows there is very little demand for them in our county.

6410. That seems to prove that the farmers are not yet ready for them?—No.

6411. You are of opinion that local experiments should be organised in consultation with the local authorities, and then correlated and circulated by a special staff from the Board of Agriculture?—Yes.

6412. In order to have the experiments repeated more than once a year and repeated in successive years on the same soil in order to get results under all conditions of climate and soil and in different years?—Yes. I feel there are so many people, like County Councils and others, making experiments who often arrive at conclusions which do not agree with each other in the slightest, and I should like

Mr. E. V. Wheeler.

Mr. E. V. V.
Wheeler.
5 June, 1907.

some experts connected with the Board of Agriculture to sift these results and see which are to be relied upon and which are fallacious.

6413. You think the Board of Agriculture should act as a kind of clearing-house, so to speak, in that respect?—Yes, and where they think experiments are doubtful they should have them carried out again in different parts of the country under their supervision.

6414. I suppose you are aware that whenever there is some special disease which breaks out in America the Department of Agriculture have a staff of men who can be sent down to the locality in order to investigate the cause?—Yes.

6415. That, I suppose, you consider desirable also?—Yes. That is very desirable also, and further there must be some money to do it with. I dare say, as you know, we have had an outbreak of this gooseberry pest in our county, and we have found difficulty in getting money to deal with it. Luckily we had some money in Worcestershire which was available and at my discretion, and we were able to use it for that purpose, but that was a stroke of luck.

6416. I see in Worcestershire you have a system of apprenticing boys for a course of manual instruction under practical experts?—Yes: that is for practical labourers. We have attempted in Worcestershire, as far as possible, to improve the class of agricultural labourers. A system began of holding classes for those lads all through the county, and we picked out the most likely of them and sent them for a three months' course, or whatever it might be, to work with a practical man. One thing we have taken up has been the pruning and grafting of trees. We apprentice these boys for the session, and they go through their work, and you can even now see the vast improvement in the trees in the county that has come about by that work.

6417. You select a practical man in the county on account of his knowledge, and you send the boy to him?—Yes—for instance, my own shepherd took a boy some years ago for shearing. Another man is an expert grafter, and we send a boy to him, and give him so much to teach the boy, and the boy so much to keep himself for the session, and if he does well we send him for another session.

6418. Is that done by the county?—Yes.

6419. Are the people to whom they are apprenticed in any way remunerated?—Yes. I think we give them two guineas for the session's work, or some such sum as that.

6420. Are the sons of labourers eager to obtain those apprenticeships?—Not so eager as I should like to see them, but we do have a good many. I think we had four for grafting this time and six or eight for hop drying.

6421. You think after they leave the elementary school they should have continuation classes provided for them?—Yes, because many of them after they leave school never take up a pen again.

6422. Are the continuation classes organised in Worcestershire?—Not very generally. They are more in the towns than in the country. Of course there is a difficulty in getting a boy after he has done his day's work to go to those places, and they do not go much in the country places.

6423. Are there any lectures given throughout the county on agricultural subjects?—We have no regular lecturer employed, but where there is a demand in any locality for a lecturer on special subjects we employ a lecturer to go and give lectures in that.

6424. You have no difficulty in finding men to give those lectures?—No, we generally find them. In veterinary science we employ a local veterinary surgeon, and we have employed him for some years. There is also a travelling dairy, and from the pupils of the travelling dairy we select the most likely and give them scholarships to go to any dairy college they like—Reading or any college they would like to go to.

6425. Do you have veterinary lectures?—Yes.

6426. Is anything done for farriers?—Yes, there is a travelling farriery van, and once a year our veterinary lecturer holds an examination of the pupils who have attended during the year, and he, as a rule, also at the end of each class, gives them two or three lectures on the subject.

6427. That is appreciated by those who attend?—Yes—blacksmiths mostly.

6428. Would you say farmers are beginning to appreciate agricultural education?—Yes, I think they are, but it is only slowly.

6429. (By Lord Barnard.) I see by the last *Annual Report of the Board of Agriculture on the Distribution of Grants for Agricultural Education* that your county was very generous, and spent a considerable sum on agricultural education. Is there any fear of that sum being diminished?—You mean of the County Council's giving a lesser grant?

6430. Yes.—I do not think so. A great part of that grant was given to the Worcestershire Union of Workmen's Clubs and Institutes for horticulture.

6431. Yes. I see that £800 goes exclusively for horticultural education?—Yes.

6432. Of the £250 grants to colleges and schools, £100 goes to the National Fruit and Cider Institute?—That is so.

6433. I suppose the Committee are right in assuming that Worcestershire is mainly an agricultural county?—The greater part of it. In the north-east we go right up to the boundaries of Birmingham, and there there is a very large urban population, but if you cut that corner out, the rest of it is purely agricultural.

6434. I asked the question in order to ascertain whether the lads were induced to go away from the country by the prospect of earning higher wages in mines or towns or anything of that kind, or do they stay in the country districts?—A good many of them go away.

6435. That must rather militate against the success of the scheme of apprenticeships which you have just explained to the Chairman, must it not?—Yes, to some extent it does. I think the railway companies seem to draw the boys more than anything else from the country districts.

6436. I believe you have a very large fruit-growing industry in your district?—We have.

6437. Have you given any attention to forestry at all?—No, not officially by the County Council at all.

6438. Have you any woods there; is it a woodland county at all?—There is a good deal of timber, but there is not much what you may call waste land that would be suitable for putting into forest. Most of the land is too good for the purpose.

6439. The question I was rather leading up to was as to whether it was possible to get labouring men who would be capable of becoming woodmen, but perhaps, as you have not much woodland in Worcestershire it is not worth while putting the question?—I think they would be very difficult to find at present.

6440. I gather you are of opinion from a national point of view the whole question of agricultural education is at present in course of development?—Yes.

6441. In fact, it has only begun in the course of the last ten or 20 years, and therefore we cannot look to any decision come to at present as representing finality or as in the least likely to represent finality?—No; it will have to go on progressing.
